
See also this one from a stenographer with a prominent Wall Street firm:

"I have now been using for some time the cushion keys placed by you on my typewriter, and I feel constrained to say a word in their commendation.

I have been operating a typewriter for several years past, eight hours each day, during which time I have always suffered more or less from soreness of the finger tips. Your keys not only do away with this entirely, but add materially to the speed of the machine.

I cannot say too much in recommendation of your device, and shall be pleased to have you refer to me at any time."

This is from the Official Stenographer of Somerset and Bedford Counties, Pennsylvania:

"Having tested them for a month, I am very much pleased with them; they add an elasticity of touch to the machine which I would not do without for twice their cost."

Do you want further evidence? If so, read this from a stenographer with a large railroad ticket office in New York City:

"After using your covers for the Remington Typewriter, as an aid for my sight and touch of the fingers, I wish to say I would rather not be without the same now, and recommend them to every operator."

And this from the stenographer of a large insurance company in New York:

"The cushion keys purchased of you some time ago have proven quite satisfactory. They are certainly a vast improvement to a typewriting machine.

We could go on and fill many pages with similar letters, the originals of which are in our possession. We do not publish the names, because in some cases, it might cause the writer trouble or annoyance. We are constantly in receipt of such communications.

In addition to increased comfort for the operator, and lessened labor, the cushion keys greatly assist in preserving the alignment of a machine, reducing the wear and tear on the numerous working parts, especially the type-bar bearings, and effect an **actual saving in the expense of keeping the machine in proper repair.**

Any special characters needed to complete sets are supplied without extra charge.

TYPEWRITER CUSHION KEY COMPANY,

H. W. BUSE, New York City Agent,
144-152 Nassau St., American Tract Society Bldg.

289-297 Washington St., Newark, N. J.

"F. R. Buse" - Frederick Rowland Buse

https://www.findagrave.com/memorial/34794799/frederick-rowland-buse

Lieutenant (Junior Grade) F. R. Buse, USN, was designated Naval Aviator #3143 in 1924. Graduated U.S. Naval Academy, Class of 1920 (graduating in 1919). Lieutenant Buse was killed in the crash of his aircraft at NAS Anacostia.

Father also called Burgess Henry W Buse , sometimes just Burgess Buse

1988 (Oct 22) - "GEN. HENRY W. BUSE, OFFICIAL OF OLYMPIC PANEL, DIES AT 76"

Washington Post

Source - [HN010Q][GDrive]

Henry William Buse Jr., 76, a retired Marine Corps lieutenant general and veteran of World War II and the Korean War, who also had served on the U.S. Olympic Committee, died of cancer Oct. 19 at his home in Severna Park, Md.

Gen. Buse was born in Ridley Park, Pa. He graduated from the U.S. Naval Academy at Annapolis in 1934 and had assignments at Quantico and Pearl Harbor.

During World War II, he served with the lst Marine Division in the Pacific. He received the Bronze Star for his service in the capture and defense of Guadalcanal. He was commander of the 3rd battalion of the 7th Marines on Cape Gloucester, where he received the Silver Star and a second Bronze Star.

From 1944 to 1951, Gen. Buse had a variety of command and staff assignments in this country and in Japan. He served in Korea in 1952 and 1953 and received the Legion of Merit.

He was transferred to Marine Corps headquarters in Washington in 1953. He later served for two years as chief of staff of the Marine Corps recruit depot in Parris Island, S.C. He was promoted to brigadier general in 1958.

From 1959 to 1961, Gen. Buse was Marine Corps liaison officer to the vice chief of naval operations. He took command of the 3rd Marine Division on Okinawa in June 1962 and was promoted to major general a month later.

He was transferred back to Marine Corps headquarters in 1963 and became deputy chief of staff for plans and programs. He was promoted to lieutenant general in 1964.

Gen. Buse later became chief of staff at Marine Corps headquarters and was commanding general of Fleet Marine Forces in the Pacific from 1968 until he retired in 1970.

From 1958 to 1985, he had served on the U.S. Olympic Committee, where he was assistant to three former presidents of the committee. He was a member of the Naval Academy Alumni Association and the Naval Academy Chapel. He was a former member of the school board in Severn, Md.

Survivors include his wife, the former Dorothy Snow of Severna Park; a daughter, Barbara Johnson of Bowie; a son, retired Marine Corps Col. Henry W. Buse III of Chicago; a sister, Elizabeth Buse of Swarthmore, Pa., and two grandchildren.

Vannevar Bush (/væˈniːvɑːr/ *van-NEE-var*; March 11, 1890 – June 28, 1974) was an American engineer, inventor and science administrator, who during World War II headed the U.S. Office of Scientific Research and Development (OSRD), through which almost all wartime military R&D was carried out, including important developments in radar and the initiation and early administration of the Manhattan Project. He emphasized the importance of scientific research to national security and economic well-being, and was chiefly responsible for the movement that led to the creation of the National Science Foundation.[2]

Bush joined the Department of Electrical Engineering at Massachusetts Institute of Technology (MIT) in 1919, and founded the company now known as Raytheon in 1922. Bush became vice president of MIT and dean of the MIT School of Engineering in 1932, and president of the Carnegie Institution of Washington in 1938.

During his career, Bush patented a string of his own inventions. He is known particularly for his engineering work on analog computers, and for the memex.[2] Starting in 1927, Bush constructed a differential analyzer, an analog computer with some digital components that could solve differential equations with as many as 18 independent variables. An offshoot of the work at MIT by Bush and others was the beginning of digital circuit design theory. The memex, which he began developing in the 1930s, was a hypothetical adjustable microfilm viewer with a structure analogous to that of hypertext. The memex and Bush's 1945 essay "As We May Think" influenced generations of computer scientists, who drew inspiration from his vision of the future.[3]

Bush was appointed to the National Advisory Committee for Aeronautics (NACA) in 1938, and soon became its chairman. As chairman of the National Defense Research Committee (NDRC), and later director of OSRD, Bush coordinated the activities of some six thousand leading American scientists in the application of science to warfare. Bush was a well-known policymaker and public intellectual during World War II, when he was in effect the first presidential science advisor. As head of NDRC and OSRD, he initiated the Manhattan Project, and ensured that it received top priority from the highest levels of government. In *Science, The Endless Frontier*, his 1945 report to the President of the United States, Bush called for an expansion of government support for science, and he pressed for the creation of the National Science Foundation.

Early life and work[edit]

Vannevar Bush was born in Everett, Massachusetts, on March 11, 1890, the third child and only son of Perry Bush, the local Universalist pastor, and his wife Emma Linwood (née Paine). He had two older sisters, Edith and Reba. He was named after John Vannevar, an old friend of the family who had attended Tufts College with Perry. The family moved to Chelsea, Massachusetts, in 1892,[4] and Bush graduated from Chelsea High School in 1909.[5]

He then attended Tufts, like his father before him. A popular student, he was vice president of his sophomore class, and president of his junior class. During his senior year, he managed the football team. He became a member of the Alpha Tau Omega fraternity, and dated Phoebe Clara Davis, who also came from Chelsea. Tufts allowed students to gain a master's degree in four years simultaneously with a bachelor's degree. For his master's thesis, Bush invented and patented a "profile tracer". This was a mapping device for assisting surveyors that looked like a lawn mower. It had two bicycle wheels, and a pen that plotted the terrain over which it traveled. It was the first of a string of inventions.[6][7] On graduation in 1913 he received both bachelor of science and master of science degrees.[8]

After graduation, Bush worked at General Electric (GE) in Schenectady, New York, for $14 a week. As a "test man", his job was to assess equipment to ensure that it was safe. He transferred to GE's plant in Pittsfield, Massachusetts, to work on high voltage transformers, but after a fire broke out at the plant, Bush and the other test men were suspended. He returned to Tufts in October 1914 to teach mathematics, and spent the 1915 summer break working at the Brooklyn Navy Yard as an electrical inspector. Bush was awarded a $1,500 scholarship to study at Clark University as a doctoral student of Arthur Gordon Webster, but Webster wanted Bush to study acoustics, a popular field at the time that led many to computer science. Bush preferred to quit rather than study a subject that did not interest him.[9]

Bush subsequently enrolled in the Massachusetts Institute of Technology (MIT) electrical engineering program. Spurred by the need for enough financial security to marry,[9] he submitted his thesis, entitled *Oscillating-Current Circuits: An Extension of the Theory of Generalized Angular Velocities, with Applications to the Coupled Circuit and the Artificial Transmission Line*,[10] in April 1916. His adviser, Arthur Edwin Kennelly, tried to demand more work from him, but Bush refused, and Kennelly was overruled by the department chairman; Bush received his doctorate in engineering jointly from MIT and Harvard University.[9] He married Phoebe in August 1916.[9] They had two sons: Richard Davis Bush and John Hathaway Bush.[11]

Bush accepted a job with Tufts, where he became involved with the American Radio and Research Corporation (AMRAD), which began broadcasting music from the campus on March 8, 1916. The station owner, Harold Power, hired him to run the company's laboratory, at a salary greater than that which Bush drew from Tufts. In 1917, following the United States' entry into World War I, he went to work with the National Research Council. He attempted to develop a means of detecting submarines by measuring the disturbance in the Earth's magnetic field. His device worked as designed, but only from a wooden ship; attempts to get it to work on a metal ship such as a destroyer failed.[12]

Differential analyzer in use at the Cambridge University Mathematics Laboratory, 1938.

Bush left Tufts in 1919, although he remained employed by AMRAD, and joined the Department of Electrical Engineering at Massachusetts Institute of Technology (MIT), where he worked under Dugald C. Jackson. In 1922, he collaborated with fellow MIT professor William H. Timbie on *Principles of Electrical Engineering*, an introductory textbook. AMRAD's lucrative contracts from World War I had been cancelled, and Bush attempted to reverse the company's fortunes by developing a thermostatic switch invented by Al Spencer, an AMRAD technician, on his own time. AMRAD's management was not interested in the device, but had no objection to its sale. Bush found backing from Laurence K. Marshall and Richard S. Aldrich to create the Spencer Thermostat Company, which hired Bush as a consultant. The new company soon had revenues in excess of a million dollars.[14] It merged with General Plate Company to form Metals & Controls Corporation in 1931, and with Texas Instruments in 1959. Texas Instruments sold it to Bain Capital in 2006, and it became a separate company again as Sensata Technologies in 2010.[15]

In 1924, Bush and Marshall teamed up with physicist Charles G. Smith, who had invented a device called the S-tube. This enabled radios, which had previously required two different types of batteries, to operate from mains power. Marshall raised $25,000 to set up the American Appliance Company on July 7, 1922, to market the invention, with Bush and Smith among its five directors. The venture made Bush wealthy, and the company, now known as Raytheon, ultimately became a large electronics company and defense contractor.[16][14]

Starting in 1927, Bush constructed a differential analyzer, an analog computer that could solve differential equations with as many as 18 independent variables. This invention arose from previous work performed by Herbert R. Stewart, one of Bush's masters students, who at Bush's suggestion created the integraph, a device for solving first-order differential equations, in 1925. Another student, Harold Hazen, proposed extending the device to handle second-order differential equations. Bush immediately realized the potential of such an invention, for these were much more difficult to solve, but also quite common in physics. Under Bush's supervision, Hazen was able to construct the differential analyzer, a table-like array of shafts and pens that mechanically simulated and plotted the desired equation. Unlike earlier designs that were purely mechanical, the differential analyzer had both electrical and mechanical components.[17] Among the engineers who made use of the differential analyzer was General Electric's Edith Clarke, who used it to solve problems relating to electric power transmission.[18] For developing the differential analyzer, Bush was awarded the Franklin Institute's Louis E. Levy Medal in 1928.[19]

Bush taught binary algebra, circuit theory, and operational calculus according to the methods of Oliver Heaviside while Samuel Wesley Stratton was President of MIT. When Harold Jeffreys in Cambridge, England, offered his mathematical treatment in *Operational Methods in Mathematical Physics* (1927), Bush responded with his seminal textbook *Operational Circuit Analysis* (1929) for use instructing future electrical engineers. In the preface he wrote:

I write as an engineer and do not pretend to be a mathematician. I lean for support, and expect always to lean, upon the mathematician, just as I must lean upon the chemist, the physician, or the lawyer. Norbert Wiener has patiently guided me around many a mathematical pitfall ... he has written an appendix to this text on certain mathematical points. I did not know an engineer and a mathematician could have such good times together. I only wish that I could get the real vital grasp of mathematics that he has of the basic principles of physics.

Parry Moon and Stratton were acknowledged, as was M.S. Vallarta who "wrote the first set of class notes which I used."[20]

An offshoot of the work at MIT was the beginning of digital circuit design theory by one of Bush's graduate students, Claude Shannon.[21] Working on the analytical engine, Shannon described the application of Boolean algebra to electronic circuits in his landmark master's thesis, *A Symbolic Analysis of Relay and Switching Circuits*.[22] In 1935, Bush was approached by OP-20-G, which was searching for an electronic device to aid in codebreaking. Bush was paid a $10,000 fee to design the Rapid Analytical Machine (RAM). The project went over budget and was not delivered until 1938, when it was found to be unreliable in service. Nonetheless, it was an important step toward creating such a device.[23]

The reform of the administration of MIT began in 1930 with the appointment of Karl T. Compton as president. Bush and Compton soon clashed over the issue of limiting the amount of outside consultancy by professors, a battle Bush quickly lost, but the two men soon built a solid professional relationship. Compton appointed Bush to the newly created post of vice president in 1932. That year Bush also became the dean of the MIT School of Engineering. The two positions came with a salary of $12,000 plus $6,000 for expenses per annum.[24]

The companies Bush helped to found and the technologies he brought into the market allowed him not to be concerned with financial well-being though, and so he was able to pursue academic and scientific studies that he felt made the world better in the years before and after World War II.

World War II[edit]

Carnegie Institution for Science[edit]

In May 1938, Bush accepted a prestigious appointment as president of the Carnegie Institution of Washington (CIW), which had been founded in Washington, D.C. Also known as the Carnegie Institution for Science, it had an endowment of $33 million, and annually spent $1.5 million in research, most of which was carried out at its eight major laboratories. Bush became its president on January 1, 1939, with a salary of $25,000. He was now able to influence research policy in the United States at the highest level, and could informally advise the government on scientific matters.[25] Bush soon discovered that the CIW had serious financial problems, and he had to ask the Carnegie Corporation for additional funding.[26]

Bush clashed over leadership of the institute with Cameron Forbes, CIW's chairman of the board, and with his predecessor, John Merriam, who continued to offer unwanted advice. A major embarrassment to them all was Harry H. Laughlin, the head of the Eugenics Record Office, whose activities Merriam had attempted to curtail without success. Bush made it a priority to remove him, regarding him as a scientific fraud, and one of his first acts was to ask for a review of Laughlin's work. In June 1938, Bush asked Laughlin to retire, offering him an annuity, which Laughlin reluctantly accepted. The Eugenics Record Office was renamed the Genetics Record Office, its funding was drastically cut, and it was closed completely in 1944.[26] Senator Robert Reynolds attempted to get Laughlin reinstated, but Bush informed the trustees that an inquiry into Laughlin would "show him to be physically incapable of directing an office, and an investigation of his scientific standing would be equally conclusive."[27]

Bush wanted the institute to concentrate on hard science. He gutted Carnegie's archeology program, setting the field back many years in the United States. He saw little value in the humanities and social sciences, and slashed funding for *Isis*, a journal dedicated to the history of science and technology and its cultural influence.[26] Bush later explained that "I have a great reservation about these studies where somebody goes out and interviews a bunch of people and reads a lot of stuff and writes a book and puts it on a shelf and nobody ever reads it."[28]

National Advisory Committee for Aeronautics[edit]

On August 23, 1938, Bush was appointed to the National Advisory Committee for Aeronautics (NACA), the predecessor of NASA.[25] Its chairman Joseph Sweetman Ames became ill, and Bush, as vice chairman, soon had to act in his place. In December 1938, NACA asked for $11 million to establish a new aeronautical research laboratory in Sunnyvale, California, to supplement the existing Langley Memorial Aeronautical Laboratory. The California location was chosen for its proximity to some of the largest aviation corporations. This decision was supported by the chief of the United States Army Air Corps, Major General Henry H. Arnold, and by the head of the navy's Bureau of Aeronautics, Rear Admiral Arthur B. Cook, who between them were planning to spend $225 million on new aircraft in the year ahead. However, Congress was not convinced of its value, and Bush had to appear before the Senate Appropriations Committee on April 5, 1939. It was a frustrating experience for Bush, since he had never appeared before Congress before, and the senators were not swayed by his arguments. Further lobbying was required before funding for the new center, now known as the Ames Research Center, was finally approved. By this time, war had broken out in Europe, and the inferiority of American aircraft engines was apparent,[29] in particular the Allison V-1710 which performed poorly at high altitudes and had to be removed from the P-51 Mustang in favor of the British Rolls-Royce Merlin engine.[30] The NACA asked for funding to build a third center in Ohio, which became the Glenn Research Center. Following Ames's retirement in October 1939, Bush became chairman of the NACA, with George J. Mead as his deputy.[29] Bush remained a member of the NACA until November 1948.[31]

National Defense Research Committee[edit]

During World War I, Bush had become aware of poor cooperation between civilian scientists and the military. Concerned about the lack of coordination in scientific research and the requirements of defense mobilization, Bush proposed the creation of a general directive agency in the federal government, which he discussed with his colleagues. He had the secretary of NACA prepare a draft of the proposed National Defense Research Committee (NDRC) to be presented to Congress, but after the Germans invaded France in May 1940, Bush decided speed was important and approached President Franklin D. Roosevelt directly. Through the President's uncle, Frederic Delano, Bush managed to set up a meeting with Roosevelt on June 12, 1940, to which he brought a single sheet of paper describing the agency. Roosevelt approved the proposal in 15 minutes, writing "OK – FDR" on the sheet.[32]

With Bush as chairman, the NDRC was functioning even before the agency was officially established by order of the Council of National Defense on June 27, 1940. The organization operated financially on a hand-to-mouth basis with monetary support from the president's emergency fund.[33] Bush appointed four leading scientists to the NDRC: Karl Taylor Compton (president of MIT), James B. Conant (president of Harvard University), Frank B. Jewett (president of the National Academy of Sciences and chairman of the Board of Directors of Bell Laboratories), and Richard C. Tolman (dean of the graduate school at Caltech); Rear Admiral Harold G. Bowen, Sr. and Brigadier General George V. Strong represented the military. The civilians already knew each other well, which allowed the organization to begin functioning immediately.[34] The NDRC established itself in the administration building at the Carnegie Institution of Washington.[35] Each member of the committee was assigned an area of responsibility, while Bush handled coordination. A small number of projects reported to him directly, such as the S-1 Section.[36] Compton's deputy, Alfred Loomis, said that "of the men whose death in the Summer of 1940 would have been the greatest calamity for America, the President is first, and Dr. Bush would be second or third."[37]

Bush was fond of saying that "if he made any important contribution to the war effort at all, it would be to get the Army and Navy to tell each other what they were doing."[38] He established a cordial relationship with Secretary of War Henry L. Stimson, and Stimson's assistant, Harvey H. Bundy, who found Bush "impatient" and "vain", but said he was "one of the most important, able men I ever knew".[33] Bush's relationship with the navy was more turbulent. Bowen, the director of the Naval Research Laboratory (NRL), saw the NDRC as a bureaucratic rival, and recommended abolishing it. A series of bureaucratic battles ended with the NRL placed under the Bureau of Ships, and Secretary of the Navy Frank Knox placing an unsatisfactory fitness report in Bowen's personnel file. After the war, Bowen would again try to create a rival to the NDRC inside the navy.[39]

On August 31, 1940, Bush met with Henry Tizard, and arranged a series of meetings between the NDRC and the Tizard Mission, a British scientific delegation. At a meeting On September 19, 1940, the Americans described Loomis and Compton's microwave research. They had an experimental 10 cm wavelength short wave radar, but admitted that it did not have enough power and that they were at a dead end. Taffy Bowen and John Cockcroft of the Tizard Mission then produced a cavity magnetron, a device more advanced than anything the Americans had seen, with a power output of around 10 KW at 10 cm,[40] enough to spot the periscope of a surfaced submarine at night from an aircraft. To exploit the invention, Bush decided to create a special laboratory. The NDRC allocated the new laboratory a budget of $455,000 for its first year. Loomis suggested that the lab should be run by the Carnegie Institution, but Bush convinced him that it would best be run by MIT. The Radiation Laboratory, as it came to be known, tested its airborne radar from an

institution, but Bush convinced him that it would best be run by MIT. The Radiation Laboratory, as it came to be known, tested its airborne radar from an Army B-18 on March 27, 1941. By mid-1941, it had developed SCR-584 radar, a mobile radar fire control system for antiaircraft guns.[41]

In September 1940, Norbert Wiener approached Bush with a proposal to build a digital computer. Bush declined to provide NDRC funding for it on the grounds that he did not believe that it could be completed before the end of the war. The supporters of digital computers were disappointed at the decision, which they attributed to a preference for outmoded analog technology. In June 1943, the Army provided $500,000 to build the computer, which became ENIAC, the first general-purpose electronic computer. Having delayed its funding, Bush's prediction proved correct as ENIAC was not completed until December 1945, after the war had ended.[42] His critics saw his attitude as a failure of vision.[43]

Office of Scientific Research and Development[edit]

On June 28, 1941, Roosevelt established the Office of Scientific Research and Development (OSRD) with the signing of Executive Order 8807.[44] Bush became director of the OSRD while Conant succeeded him as chairman of the NDRC, which was subsumed into the OSRD. The OSRD was on a firmer financial footing than the NDRC since it received funding from Congress, and had the resources and the authority to develop weapons and technologies with or without the military. Furthermore, the OSRD had a broader mandate than the NDRC, moving into additional areas such as medical research[45] and the mass production of penicillin and sulfa drugs. The organization grew to 850 full-time employees,[46] and produced between 30,000 and 35,000 reports.[47] The OSRD was involved in some 2,500 contracts,[48] worth in excess of $536 million.[49]

Bush's method of management at the OSRD was to direct overall policy, while delegating supervision of divisions to qualified colleagues and letting them do their jobs without interference. He attempted to interpret the mandate of the OSRD as narrowly as possible to avoid overtaxing his office and to prevent duplicating the efforts of other agencies. Bush would often ask: "Will it help to win a war; *this* war?"[50] Other challenges involved obtaining adequate funds from the president and Congress and determining apportionment of research among government, academic, and industrial facilities.[50] His most difficult problems, and also greatest successes, were keeping the confidence of the military, which distrusted the ability of civilians to observe security regulations and devise practical solutions,[51] and opposing conscription of young scientists into the armed forces. This became especially difficult as the army's manpower crisis really began to bite in 1944.[52] In all, the OSRD requested deferments for some 9,725 employees of OSRD contractors, of which all but 63 were granted.[52] In his obituary, *The New York Times* described Bush as "a master craftsman at steering around obstacles, whether they were technical or political or bull-headed generals and admirals."[53]

Proximity fuze[edit]

Cut away diagram of the proximity fuze Mark 53

In August 1940, the NDRC began work on a proximity fuze, a fuze inside an artillery shell that would explode when it came close to its target. A radar set, along with the batteries to power it, was miniaturized to fit inside a shell, and its glass vacuum tubes designed to withstand the 20,000 g-force of being fired from a gun and 500 rotations per second in flight.[54] Unlike normal radar, the proximity fuze sent out a continuous signal rather than short pulses.[55] The NDRC created a special Section T chaired by Merle Tuve of the CIW, with Commander William S. Parsons as special assistant to Bush and liaison between the NDRC and the Navy's Bureau of Ordnance (BuOrd).[54] One of CIW staff members that Tuve recruited to Section T in 1940 was James Van Allen. In April 1942, Bush placed Section T directly under the OSRD, and Parsons in charge. The research effort remained under Tuve but moved to the Johns Hopkins University's Applied Physics Laboratory (APL), where Parsons was BuOrd's representative.[56] In August 1942, a live firing test was conducted with the newly commissioned cruiser USS *Cleveland*; three pilotless drones were shot down in succession.[57]

To preserve the secret of the proximity fuze, its use was initially permitted only over water, where a dud round could not fall into enemy hands. In late 1943, the Army obtained permission to use the weapon over land. The proximity fuze proved particularly effective against the V-1 flying bomb over England, and later Antwerp, in 1944. A version was also developed for use with howitzers against ground targets.[58] Bush met with the Joint Chiefs of Staff in October 1944 to press for its use, arguing that the Germans would be unable to copy and produce it before the war was over. Eventually, the Joint Chiefs agreed to allow its employment from December 25. In response to the German Ardennes Offensive on December 16, 1944, the immediate use of the proximity fuze was authorized, and it went into action with deadly effect.[59] By the end of 1944, proximity fuzes were coming off the production lines at the rate of 40,000 per day.[58] "If one looks at the proximity fuze program as a whole," historian James Phinney Baxter III wrote, "the magnitude and complexity of the effort rank it among the three or four most extraordinary scientific achievements of the war."[60]

The German V-1 flying bomb demonstrated a serious omission in OSRD's portfolio: guided missiles. While the OSRD had some success developing unguided rockets, it had nothing comparable to the V-1, the V-2 or the Henschel Hs 293 air-to-ship gliding guided bomb. Although the United States trailed the Germans and Japanese in several areas, this represented an entire field that had been left to the enemy. Bush did not seek the advice of Dr. Robert H. Goddard. Goddard would come to be regarded as America's pioneer of rocketry, but many contemporaries regarded him as a crank. Before the war, Bush had gone on the record as saying, "I don't understand how a serious scientist or engineer can play around with rockets",[61] but in May 1944, he was forced to travel to London to warn General Dwight Eisenhower of the danger posed by the V-1 and V-2.[62] Bush could only recommend that the launch sites be bombed, which was done.[63]

Manhattan Project[edit]

Bush played a critical role in persuading the United States government to undertake a crash program to create an atomic bomb.[64] When the NDRC was formed, the Committee on Uranium was placed under it, reporting directly to Bush as the Uranium Committee. Bush reorganized the committee, strengthening its scientific component by adding Tuve, George B. Pegram, Jesse W. Beams, Ross Gunn and Harold Urey.[65] When the OSRD was formed in June 1941, the Uranium Committee was again placed directly under Bush. For security reasons, its name was changed to the Section S-1.[66]

Left to right: Vannevar Bush, James B. Conant, Major General Leslie Groves and Colonel Franklin Matthias at the Hanford Site in July 1945

Bush met with Roosevelt and Vice President Henry A. Wallace on October 9, 1941, to discuss the project. He briefed Roosevelt on Tube Alloys, the British atomic bomb project and its Maud Committee, which had concluded that an atomic bomb was feasible, and on the German nuclear energy project, about which little was known. Roosevelt approved and expedited the atomic program. To control it, he created a Top Policy Group consisting of himself—although he never attended a meeting—Wallace, Bush, Conant, Stimson and the Chief of Staff of the Army, General George Marshall.[67] On Bush's advice, Roosevelt chose the army to run the project rather than the navy, although the navy had shown far more interest in the field, and was already conducting research into atomic energy for powering ships. Bush's negative experiences with the Navy had convinced him that it would not listen to his advice, and could not handle large-scale construction projects.[68][69]

In March 1942, Bush sent a report to Roosevelt outlining work by Robert Oppenheimer on the nuclear cross section of uranium-235. Oppenheimer's

calculations, which Bush had George Kistiakowsky check, estimated that the critical mass of a sphere of Uranium-235 was in the range of 2.5 to 5 kilograms, with a destructive power of around 2,000 tons of TNT. Moreover, it appeared that plutonium might be even more fissile.[70] After conferring with Brigadier General Lucius D. Clay about the construction requirements, Bush drew up a submission for $85 million in fiscal year 1943 for four pilot plants, which he forwarded to Roosevelt on June 17, 1942. With the Army on board, Bush moved to streamline oversight of the project by the OSRD, replacing the Section S-1 with a new S-1 Executive Committee.[71]

Bush soon became dissatisfied with the dilatory way the project was run, with its indecisiveness over the selection of sites for the pilot plants. He was particularly disturbed at the allocation of an AA-3 priority, which would delay completion of the pilot plants by three months. Bush complained about these problems to Bundy and Under Secretary of War Robert P. Patterson. Major General Brehon B. Somervell, the commander of the army's Services of Supply, appointed Brigadier General Leslie R. Groves as project director in September. Within days of taking over, Groves approved the proposed site at Oak Ridge, Tennessee, and obtained a AAA priority. At a meeting in Stimson's office on September 23 attended by Bundy, Bush, Conant, Groves, Marshall Somervell and Stimson, Bush put forward his proposal for steering the project by a small committee answerable to the Top Policy Group. The meeting agreed with Bush, and created a Military Policy Committee chaired by him, with Somervell's chief of staff, Brigadier General Wilhelm D. Styer, representing the army, and Rear Admiral William R. Purnell representing the navy.[72]

At the meeting with Roosevelt on October 9, 1941, Bush advocated cooperating with the United Kingdom, and he began corresponding with his British counterpart, Sir John Anderson.[73] But by October 1942, Conant and Bush agreed that a joint project would pose security risks and be more complicated to manage. Roosevelt approved a Military Policy Committee recommendation stating that information given to the British should be limited to technologies that they were actively working on and should not extend to post-war developments.[74] In July 1943, on a visit to London to learn about British progress on antisubmarine technology,[75] Bush, Stimson, and Bundy met with Anderson, Lord Cherwell, and Winston Churchill at 10 Downing Street. At the meeting, Churchill forcefully pressed for a renewal of interchange, while Bush defended current policy. Only when he returned to Washington did he discover that Roosevelt had agreed with the British. The Quebec Agreement merged the two atomic bomb projects, creating the Combined Policy Committee with Stimson, Bush and Conant as United States representatives.[76]

Bush appeared on the cover of *Time* magazine on April 3, 1944.[77] He toured the Western Front in October 1944, and spoke to ordnance officers, but no senior commander would meet with him. He was able to meet with Samuel Goudsmit and other members of the Alsos Mission, who assured him that there was no danger from the German project; he conveyed this assessment to Lieutenant General Bedell Smith.[78] In May 1945, Bush became part of the Interim Committee formed to advise the new president, Harry S. Truman, on nuclear weapons.[79] It advised that the atomic bomb should be used against an industrial target in Japan as soon as possible and without warning.[80] Bush was present at the Alamogordo Bombing and Gunnery Range on July 16, 1945, for the Trinity nuclear test, the first detonation of an atomic bomb.[81] Afterwards, he took his hat off to Oppenheimer in tribute.[82]

Before the end of the Second World War, Bush and Conant had foreseen and sought to avoid a possible nuclear arms race. Bush proposed international scientific openness and information sharing as a method of self-regulation for the scientific community, to prevent any one political group gaining a scientific advantage. Before nuclear research became public knowledge, Bush used the development of biological weapons as a model for the discussion of similar issues, an "opening wedge". He was less successful in promoting his ideas in peacetime with President Harry Truman, than he had been under wartime conditions with Roosevelt.[2][83]

In "As We May Think", an essay published by the *Atlantic Monthly* in July 1945, Bush wrote: "This has not been a scientist's war; it has been a war in which all have had a part. The scientists, burying their old professional competition in the demand of a common cause, have shared greatly and learned much. It has been exhilarating to work in effective partnership."[84]

Post-war years[edit]

Memex concept[edit]

Bush introduced the concept of the memex during the 1930s, which he imagined as a form of memory augmentation involving a microfilm-based "device in which an individual stores all his books, records, and communications, and which is mechanized so that it may be consulted with exceeding speed and flexibility. It is an enlarged intimate supplement to his memory."[84] He wanted the memex to emulate the way the brain links data by association rather than by indexes and traditional, hierarchical storage paradigms, and be easily accessed as "a future device for individual use ... a sort of mechanized private file and library" in the shape of a desk.[84] The memex was also intended as a tool to study the brain itself.[84]

Bush conceived the encyclopedia of the future as having a mesh of associative trails running through it, akin to hyperlinks, stored in a memex system.

After thinking about the potential of augmented memory for several years, Bush set out his thoughts at length in "As We May Think", predicting that "wholly new forms of encyclopedias will appear, ready made with a mesh of associative trails running through them, ready to be dropped into the memex and there amplified".[84] "As We May Think" was published in the July 1945 issue of *The Atlantic*. A few months later, *Life* magazine published a condensed version of "As We May Think", accompanied by several illustrations showing the possible appearance of a memex machine and its companion devices.[85]

Shortly after "As We May Think" was originally published, Douglas Engelbart read it, and with Bush's visions in mind, commenced work that would later lead to the invention of the mouse.[86] Ted Nelson, who coined the terms "hypertext" and "hypermedia", was also greatly influenced by Bush's essay.[87][88]

"As We May Think" has turned out to be a visionary and influential essay.[89] In their introduction to a paper discussing information literacy as a discipline, Bill Johnston and Sheila Webber wrote in 2005 that:

Bush's paper might be regarded as describing a microcosm of the information society, with the boundaries tightly drawn by the interests and experiences of a major scientist of the time, rather than the more open knowledge spaces of the 21st century. Bush provides a core vision of the importance of information to industrial / scientific society, using the image of an "information explosion" arising from the unprecedented demands on scientific production and technological application of World War II. He outlines a version of information science as a key discipline within the practice of scientific and technical knowledge domains. His view encompasses the problems of information overload and the need to devise efficient mechanisms to control and channel information for use.[90]

Bush was concerned that information overload might inhibit the research efforts of scientists. Looking to the future, he predicted a time when "there is a growing mountain of research. But there is increased evidence that we are being bogged down today as specialization extends. The investigator is staggered by the findings and conclusions of thousands of other workers."[84]

National Science Foundation[edit]

The OSRD continued to function actively until some time after the end of hostilities, but by 1946–1947 it had been reduced to a minimal staff charged with finishing work remaining from the war period; Bush was calling for its closure even before the war had ended. During the war, the OSRD had issued contracts as it had seen fit, with just eight organizations accounting for half of its spending. MIT was the largest to receive funds, with its obvious ties to Bush and his close associates. Efforts to obtain legislation exempting the OSRD from the usual government conflict of interest regulations failed, leaving Bush and other OSRD principals open to prosecution. Bush therefore pressed for OSRD to be wound up as soon as possible.[91]

With its dissolution, Bush and others had hoped that an equivalent peacetime government research and development agency would replace the OSRD. Bush felt that basic research was important to national survival for both military and commercial reasons, requiring continued government support for science and technology; technical superiority could be a deterrent to future enemy aggression. In *Science, The Endless Frontier*, a July 1945 report to the president, Bush maintained that basic research was "the pacemaker of technological progress". "New products and new processes do not appear full-grown," Bush wrote in the report. "They are founded on new principles and new conceptions, which in turn are painstakingly developed by research in the purest realms of science!"[92] In Bush's view, the "purest realms" were the physical and medical sciences; he did not propose funding the social sciences.[93] In *Science, The Endless Frontier*, science historian Daniel Kevles later wrote, Bush "insisted upon the principle of Federal patronage for the advancement of knowledge in the United States, a departure that came to govern Federal science policy after World War II."[94]

Bush (left) with Harry S. Truman (center) and James B. Conant (right)

In July 1945, the Kilgore bill was introduced in Congress, proposing the appointment and removal of a single science administrator by the president, with emphasis on applied research, and a patent clause favoring a government monopoly. In contrast, the competing Magnuson bill was similar to Bush's proposal to vest control in a panel of top scientists and civilian administrators with the executive director appointed by them. The Magnuson bill emphasized basic research and protected private patent rights.[95] A compromise Kilgore–Magnuson bill of February 1946 passed the Senate but expired in the House because Bush favored a competing bill that was a virtual duplicate of Magnuson's original bill.[96] A Senate bill was introduced in February 1947 to create the National Science Foundation (NSF) to replace the OSRD. This bill favored most of the features advocated by Bush, including the controversial administration by an autonomous scientific board. The bill passed the Senate and the House, but was pocket vetoed by Truman on August 6, on the grounds that the administrative officers were not properly responsible to either the president or Congress.[97] The OSRD was abolished without a successor organization on December 31, 1947.[98]

Without a National Science Foundation, the military stepped in, with the Office of Naval Research (ONR) filling the gap. The war had accustomed many scientists to working without the budgetary constraints imposed by pre-war universities.[99] Bush helped create the Joint Research and Development Board (JRDB) of the Army and Navy, of which he was chairman. With passage of the National Security Act on July 26, 1947, the JRDB became the Research and Development Board (RDB). Its role was to promote research through the military until a bill creating the National Science Foundation finally became law.[100] By 1953, the Department of Defense was spending $1.6 billion a year on research; physicists were spending 70 percent of their time on defense related research, and 98 percent of the money spent on physics came from either the Department of Defense or the Atomic Energy Commission (AEC), which took over from the Manhattan Project on January 1, 1947.[101] Legislation to create the National Science Foundation finally passed through Congress and was signed into law by Truman in 1950.[102]

The authority that Bush had as chairman of the RDB was much different from the power and influence he enjoyed as director of OSRD and would have enjoyed in the agency he had hoped would be independent of the Executive branch and Congress. He was never happy with the position and resigned as chairman of the RDB after a year, but remained on the oversight committee.[103] He continued to be skeptical about rockets and missiles, writing in his 1949 book, *Modern Arms and Free Men*, that intercontinental ballistic missiles would not be technically feasible "for a long time to come ... if ever".[104]

Later life[edit]

With Truman as president, men like John R. Steelman, who was appointed chairman of the President's Scientific Research Board in October 1946, came to prominence.[105] Bush's authority, both among scientists and politicians, suffered a rapid decline, though he remained a revered figure.[106] In September 1949, he was appointed to head a scientific panel that included Oppenheimer to review the evidence that the Soviet Union had tested its first atomic bomb. The panel concluded that it had, and this finding was relayed to Truman, who made the public announcement.[107] During 1952 Bush was one of five members of the State Department Panel of Consultants on Disarmament, and led the panel in urging that the United States postpone its planned first test of the hydrogen bomb and seek a test ban with the Soviet Union, on the grounds that avoiding a test might forestall development of a catastrophic new weapon and open the way for new arms agreements between the two nations.[108] The panel lacked political allies in Washington, however, and the Ivy Mike shot went ahead as scheduled.[108] Bush was outraged when a security hearing stripped Oppenheimer of his security clearance in 1954; he issued a strident attack on Oppenheimer's accusers in *The New York Times*. Alfred Friendly summed up the feeling of many scientists in declaring that Bush had become "the Grand Old Man of American science".[109]

Bush continued to serve on the NACA through 1948 and expressed annoyance with aircraft companies for delaying development of a turbojet engine because of the huge expense of research and development as well as retooling from older piston engines.[110] He was similarly disappointed with the automobile industry, which showed no interest in his proposals for more fuel-efficient engines. General Motors told him that "even if it were a better engine, [General Motors] would not be interested in it."[111] Bush likewise deplored trends in advertising. "Madison Avenue believes", he said, "that if you tell the public something absurd, but do it enough times, the public will ultimately register it in its stock of accepted verities."[112]

From 1947–1962, Bush was on the board of directors for American Telephone and Telegraph. He retired as president of the Carnegie Institution and returned to Massachusetts in 1955,[109] but remained a director of Metals and Controls Corporation from 1952–1959, and of Merck & Co. 1949–1962.[113] Bush became chairman of the board at Merck following the death of George W. Merck, serving until 1962. He worked closely with the company's president, Max Tishler, although Bush was concerned about Tishler's reluctance to delegate responsibility. Bush distrusted the company's sales organization, but supported Tishler's research and development efforts.[114] He was a trustee of Tufts College 1943–1962, of Johns Hopkins University 1943–1955, of the Carnegie Corporation of New York 1939–1950, the Carnegie Institution of Washington 1958–1974, and the George Putnam Fund of Boston 1956–1972, and was a regent of the Smithsonian Institution 1943–1955.[115]

Bush received the AIEE's Edison Medal in 1943, "for his contribution to the advancement of electrical engineering, particularly through the development of new applications of mathematics to engineering problems, and for his eminent service to the nation in guiding the war research program."[116] In 1945, Bush was awarded the Public Welfare Medal from the National Academy of Sciences.[117] In 1949, he received the IRI Medal from the Industrial Research Institute in recognition of his contributions as a leader of research and development.[115] President Truman awarded Bush the Medal of Merit with bronze

oak leaf cluster in 1948, President Lyndon Johnson awarded him the National Medal of Science in 1963,[118] and President Richard Nixon presented him with the Atomic Pioneers Award from the Atomic Energy Commission in February 1970.[119] Bush was also made a Knight Commander of the Order of the British Empire in 1948, and an Officer of the French Legion of Honor in 1955.[115]

After suffering a stroke, Bush died in Belmont, Massachusetts, at the age of 84 from pneumonia on June 28, 1974. He was survived by his sons Richard (a surgeon) and John (president of Millipore Corporation) and by six grandchildren and his sister Edith. Bush's wife had died in 1969.[120] He was buried at South Dennis Cemetery in South Dennis, Massachusetts,[121] after a private funeral service. At a public memorial subsequently held by MIT,[122] Jerome Wiesner declared "No American has had greater influence in the growth of science and technology than Vannevar Bush".[113]

In 1980, the National Science Foundation created the Vannevar Bush Award to honor his contributions to public service.[123] The Vannevar Bush papers are located in several places, with the majority of the collection held at the Library of Congress. Additional papers are held by the MIT Institute Archives and Special Collections, the Carnegie Institution, and the National Archives and Records Administration.[124][125][126]

NOW IT CAN BE TOLD: The Story of the Manhattan Project, by Lt.Gen. Leslie R. Groves, U. S. Army, Ret. (Harper)—The author was a Colonel in the United States Army Engineers in September, 1942, when he was given the assignment by President Roosevelt to construct the facilities needed for the development of the atomic bomb project which the United States was undertaking and which was known then as the Manhattan Engineer District (MED) with headquarters in Washington. He was in charge of the project until December 31, 1946, when he retired, now a Lieutenant General.

During his incumbency the vast potentialities of atomic energy were explored, more than 600,000 Americans worked on various phases of the project from Oak Ridge, Tenn., to Hanford, Wash., to Los Alamos and Alamogordo, New Mexico, until the date in August, 1945, when Hiroshima was blasted, followed by a similar bombing of Nagasaki. All of which knocked Japan out of the war and that was our long objective. In Hiroshima alone the dead numbered 71,000 and 68,000 were injured.

The task confronting Gen. Groves had many ramifications. Of prime importance was secrecy and that was not easy considering the thousands employed at various sites, most of them not knowing what was going on except in their limited field of engineering and construction. The ever-iquisitive press could be told little. Only a few top government officials, including leaders in Congress where the billions in appropriations had to be made, were in the know.

In addition, the best scientists in the nation were working on special phases of the project. Many had their own ideas of how the bomb was to be developed and it was not easy to reconcile their views because, for the most part, all were working in the dark. There were no precedents to follow, no charted course—it was a procedure by trial and error.

Gen. Groves extends lavish praise on everybody concerned —Dr. Vannevar Bush, chairman of the Office of Scientific Research and Development (OSRD), Dr. James B. Conant, chairman of the National Defense Research Committee (NDRC), top brass in the Army, Navy and Air Force. He frequently refers to the splendid effort of the late Dr. Arthur H. Compton who was in charge of the Metallurgical Laboratory at the University of Chicago where he conducted valuable research to develop the knowledge needed to design, build and operate a plant for the conversion of uranium into plutonium. There were other laboratories at other Universities.

As was to be expected, Gen. Groves was a controversial figure in the atomic energy program, because the Project required one over-all boss whose decisions were final. He could not hope to please all groups all the time and he was criticized. But his present account, now that the full story can be told, makes it plain that his absorbing interest was to get the job done and to do it he chose the best men and women available.

One of his controversial selections was Dr. J. Robert Oppenheimer who was charged by some with being a security risk. Of him he writes: "As to his loyalty, I have repeatedly stated in recent years—in print, on tv, on radio, and before the Personnel Security Board, headed by Dr. Gordon Gray—that I would be greatly surprised if Oppenheimer had ever consciously committed a disloyal act against the United States."

The question is frequently asked: Was the development of the atomic bomb necessary, was the bombing of Japan necessary? His reply: "The atomic bombings of Hiroshima and Nagasaki ended World War II. While they brought death and destruction on a horrifying scale, they averted even greater losses — American, English and Japanese. No man can say what would have been the result if we had not taken the steps that were necessary to achieve that end. One thing seems certain—atomic energy would have been developed somewhere in the world in the mid-twentieth century. x x x In answer to the question, 'Was the development of the atomic bomb by the United States necessary?, I reply unequivocally, 'Yes'. To the question, 'Is atomic energy a force for good or for evil?', I can only say, 'As mankind wills it.'"

His story of the Manhattan Project is fascinating reading.

A Scientist's Estimate Of Today's Weapons For War

MODERN ARMS AND FREE MEN, by Vannevar Bush (271 pages; Simon & Schuster, New York; $3.50).

BOMBING by air fleets at the speeds and altitudes of the last war is now obsolete against a fully prepared and alert enemy, we are told.

Because of this "logical conclusion," Dr. Vannevar Bush, head of American scientific research and development in the last war, believes that "we have less reason to be terrified by the thought of the A-bomb delivered by fleets of bombers."

Discussing this fear of many people today, Dr. Bush, in "Modern Arms and Free Men," analyzes the changes caused by the advent of atomic energy applied to warfare. Delivery of A-bombs by bombers cannot be entirely discounted, but he maintains that "the specter of great fleets of bombers, destroying great cities at will by atomic bombs [illegible]ecter only."

The high-speed guided missile is a prime defensive weapon that promises to neutralize the high-flying bombers, according to Dr. Bush.

Used Like a Gun.

"The high-speed guided missile can be used locally, like a gun," he writes, "or carried to a threatened spot or fired from a plane. It has not the gun's limitation on ceiling and can go as high as the bomber. Its speed of a bullet pretty well guarantees it against being shot down in flight. Jamming is difficult. It is directed into its target and carries a proximity fuse. For defense of restricted areas it promises to be a deciding factor. It can be used air-to-air, but here again the interceptor can use it to better advantage than the bomber."

VANNEVAR BUSH . . . He considers possibilities and probabilities of A-bomb warfare in his book, "Modern Arms and Free Men."

This guided missile, Dr. Bush indicates, should be ready for war use by the time there are great stocks of atomic bombs. In his opinion, "it may well render all conventional mass bombing obsolete when two highly technical, alert and industrially advanced combatants clinch."

Despite this new method of defense, Dr. Bush warns that an enemy might, with great losses, get through to highly important targets. The means of defense is highly expensive, and it must be alert, he observes. There are other means of delivery of atomic bombs than dropping them from the air, such as sneaking them into harbors in ships and planting them at the bottom of rivers.

A Danger in Sneak Raids.

Sneak raids and surprise attacks must be guarded against. The sneak bomber coming in at low altitude to avoid radar warning and too low to be fired upon effectively by batteries of guns and missiles might carry an atomic bomb to a target, even if it were destroyed itself in doing so. Bombs might be lobbed into coastal cities by rocket projectors, perhaps from submarines twenty-five to fifty miles at sea, Dr. Bush says.

The question of whether germ or biological warfare will be used in the future depends, in Dr. Bush's opinion, on whether an enemy can deliver the old and the newer toxic materials effectively. He does not believe that mass delivery in an effective method is feasible, and biological weapons are not the absolute weapons, but are more important in subversive operations than in open, all-out combat.

Dr. Bush, for the last ten years president of the Carnegie Institute of Washington, also goes into the political and sociological aspects of today's developments in physical and biological science. He is optimistic about the future.

"I believe," he writes, "that the technological future is far less dreadful and frightening than many of us have been led to believe, and that the hopeful aspects of modern applied science outweigh by a heavy margin its threat to our civilization. I believe the democratic process is itself an asset with which, if we can find the enthusiasm and the skill to use it and the faith to make it strong, we can build a world in which all men can live in prosperity and peace."

Inventions Make Engineers Famous

Important discoveries or inventions have made engineers like Charles P. Steinmetz and Nikola Tesla famous. Others have gained fame not only as engineers but also as businessmen and administrators — Charles F. Kettering, Vannevar Bush and Wernher von Braun, for example. Until he entered public life, President Herbert Hoover was a mining engineer.

Tracerlab, Inc., New England Company, Employs Atoms For Peace; Develops Flourishing Trade

Editors Note: The "Big Four" talked of world agreements to use atomic energy for peace at last month's Geneva conferences. Currently, scientists from all parts of the world are meeting—also in Geneva—to discuss peaceful use of the great new force which ended World War II with the Hiroshima and Nagasaki atomic bombs. In the 10 years since the atom bombs gave birth to a whole concept of future scientific development, New England has grown into a world center in the peaceful use of atomic energy. This is the first of two articles about that development.

By CORNELIUS F. HURLEY

BOSTON (AP) — Peaceful use of atomic energy was the principal subject underlying last month's talks "at the summit" in the Big Four meeting in Geneva.

It's the main topic this month in the world gathering of atomic scientists, also in Geneva.

Here in New England the atom went to work in the peaceful way they're talking about, almost before the ashes of Hiroshima and Nagasaki cooled off after the first —and only—two uses of atomic energy in warfare.

That might have been expected, anyway.

Several New England scientists were members of the committee of experts called in for an opinion when the late Albert Einstein sent his famous letter to President Roosevelt suggesting that the winner in the race to develop an atomic bomb would be the winner of World War II as well.

Among them were the late Karl T. Compton, then president of Massachusetts Institute of Technology, and his neighbor educator, the then president of Harvard James Bryant Conant.

The committee of scientists, headed by Dr. Vannevar Bush, a Massachusetts native who won degrees from Tufts College, Harvard and MIT, advised the President to go ahead with the project.

The atom bomb project drew heavily on New England colleges and industry for electrical and chemical engineers and for physicists—some of them old hands at experiments probing the secrets of the atom.

It was a team of MIT researchers who built and successfully operated the Van de Graaff generator which split the atom a dozen years earlier in a test at South Dartmouth.

It was logical when the atom ended the war in the Pacific 10 years ago this month, and New England's scientists were free to return to peacetime pursuits, that they should turn to atomic energy for post-war careers.

One group of five—a chemist, two physicists and two electrical engineers — set up their own "atoms for peace" company a month after the war ended.

They called it Tracerlab, Inc.

The company has grown rapidly.

What was five men with an idea 10 years ago is now a busy industry which employs 1,000 persons and had a gross business of 14 million dollars last year.

The company has been expanding in three fields in the use of atomic energy—medical, research and industrial.

The company makes everything from film badges which detect the amount of exposure to radioactivity undergone by laboratory and X-ray workers to special instruments for use in nuclear research.

One of the more fascinating industrial tools developed by Tracerlab is a thickness gauge which utilizes the beta rays given off by an irradiated source to check the thickness of materials during manufacture.

The biggest saving is in material—since the material can be rolled to exact specifications without allowing a little extra thickness to meet a minimum.

The second saving is in time—the machinery doesn't have to be halted at intervals to allow for laborious measurements by hand.

Similar savings are being made by the pipeline industry through the use of radioactivity.

Tracerlab is only one of the mushrooming atomic industries which have sprung up in New England in the last 10 years.

There are many others.

The New England Governors' Committee on Atomic Energy reported recently that New England companies had 50 million dollars worth of primary contracts last Nov. 1 with the atomic energy commission.

These were contracts of $25,000 or more.

In addition there were an unknown number of contracts being filled by New England firms for other prime contractors in all parts of the country in the supply of instruments, machinery, and small parts.

One expert in the economic and atomic field estimated there are as many as 20,000 New Englanders employed in the nuclear industry—which didn't even exist 15 years ago.

Liberals Who Fought For Wallace Fear He Has Gone Conservative

By DREW PEARSON

WASHINGTON—Some of the liberals who fought so hard for Henry Wallace's confirmation are now beginning to wonder how much he is the prisoner of old line bureaucrats inside the Commerce Department.

What has particularly aroused Wallace's liberal friends is his committee to study the U. S. patent system. Wallace appointed the committee upon a letter from President Truman which reminded him the American patent system had been misused by unlawful monopolies and needed overhauling.

The committee to study patents included two men considered staunch defenders of the present setup: Charles F. Kettering, vice-president of General Motors, and Dr. Vannevar Bush, director of the Office of Scientific Research and Development. This caused Justice Department experts to hit the ceiling.

Kettering had previously told the Temporary Economic Committee he knew nothing about patent laws. Bush is considered notorious for his subservience to big business. In the early war days, they came out with a report completely whitewashing the existing patent system.

Machines That Think

THE SCIENTISTS continue to paint fabulous pictures of the wonders ahead, when scientific brains once more settle down to the useful inventions of peace.

Dr. Vannevar Bush, director of the Office of Scientific Research and Development, in his article in the Atlantic Monthly, says we may expect machines that will so supplement the mental processes that they will vastly increase our store of knowledge. Where most inventions in the past have been designed to increase man's physical powers, to lighten his labors and increase his productivity, the inventions of the future will extend his mental capacities.

Thus he pictures machines that will enormously speed up adding, counting, mathematical calculations of all sorts. Machines will take words that are spoken into them and instantly transform them into printed matter—a boon for authors and writers of all sorts. Microphotography will be so improved that the Encyclopedia Britannica can be reduced to the volume of a match box and all the printed material published by the human race "could be lugged off in a moving van."

Then there will be the memex. This is a desk-like device pictured as "an enlarged intimate supplement" to the memory. It is to be a miniature storehouse of information, all recorded on microfilm, each item available at the press of a button. Books can be summoned up instantly by this means. Detailed references bearing on any given subject, with quotations, supplemental notes and information, will be available at the pressing of the right key. Every memex will be the equivalent of a library of information, with the added advantage that one's own ideas and comments on a given subject can be tucked away for use on demand.

There is much more in prospect, covering the fields of photograph, television, electrical recording. The applications of science, as Dr. Bush says, have given man living comforts and improved health; "they have enabled him to throw masses of people against one another with cruel weapons." They may yet allow him "truly to encompass the great record and to grow in the wisdom of race experience."

PANEL OF CONSUTANTS SET UP BY STATE DEPT.

WASHINGTON (AP)—A five member panel of consultants has been set up by the State Department to advise the government on work of the United Nations Disarmament Commission.

The group includes Dr. Vannevar Bush of the Carnegie Institute; John Dickey, president of Dartmouth College; Allen W. Dulles, deputy director of the Central Intelligence Agency; Joseph E. Johnson of the Carnegie Endowment for International Peace, and J. Robert Oppenheimer, atomic scientist and director of the Princeton University Institute for Advanced Study.

The U. N. established a disarmament commission at the recent assembly session to work out comprehensive plans for regulating armed forces and armaments, including atomic armaments.

Calvin Campbell (born 1934)

"born Sept. 1, 1934 in Detroit and grew up in Midland, MI" [HL003F][GDrive]

Was a DOW Chemical CEO - was the CEO who worked with LP Gise for the rocky flats handover

Obituary

Source : [HL003F][GDrive]

Calvin A. "Tink" Campbell, Jr. Calvin A. "Tink" Campbell, Jr., 82,passed away peacefully at his Dataw Island home with his wife, Paula, by his side. A Funeral Mass will be held on Thursday, February 9, 2017 at 11:30 am at Saint Peter's Catholic Church with a reception to follow at Dataw Island Club from 1:30 Pm to 3:30 pm. Tink was born Sept. 1, 1934 in Detroit and grew up in Midland, MI. He is the son of the late Calvin "Tink" Campbell and Alta (Koch) Campbell. (The name, "Tink" was a family hand- me- down). Growing up in that company town (home of Dow Chemical)had a profound influence on Tink. While he later earned three degrees from Williams College, MIT, and a law degree from the University of MI, Tink often said that his greatest classroom was at the dining room table in Midland. ***Tink began his career in manufacturing management at Exxon (then Enjay Chemica)l in New York City in 1961****. In 1971, he pursued his entrepreneurial instincts by acquiring Goodman Equipment Corporation in Chicago. Tink was a mentor to many employees at Goodman and took an extraordinary interest in their career development and families. Tink was also involved in many business and civic organizations including the Commercial Club, Illinois Institute of Technology, and World Presidents Organization.*

He served as Chairman of the Illinois Manufacturers Association. He was the first small company CEO to be elected chairman of the National Association of Manufacturers. Tink was a director of ***Cyprus Amax Minerals Company****, Eastman Chemical Company,* ***Mine Safety Appliance (MSA)*** *and several small companies in Chicago. Tink was married for 37 years to Rosemary (Phoenix) who predeceased him. In 1998, Tink married Paula Burke. In addition to his wife, he is survived by his daughter,* ***Georgia Lundgren*** *of Denver, CO, grandson, Erik Lundgren of Denver, and granddaughter, Serena Rose Lundgren of East Longmeadow, MA. He is also survived by* ***his sister, Mary Paddon*** *of Middlebury, VT and nieces Christine Chase of Larchmont, NY and Katie Werthmann of Panton, VT. After retiring, he and Paula moved to* ***Dataw Island*** *and eventually became full time residents. Tink lived for summers with family in Glen Lake, MI where he owned a home for many years and played golf at Crystal Downs Country Club. He loved golf, Williams College, Univ. of Michigan football, and international travel. Even as he struggled with Alzheimer's disease, he never forgot what it is to be a gentleman. Tink had a deep love for family, unwavering principles and a kind word for all. Tink did not see the glass as half full-- he thought it overflowed. His legacy of uncommon decency, integrity and warmth set him apart, but he was always connected to others. Tink's was a life lived well, and his family and friends treasure his days among us. In lieu of flowers, the family suggests that donations be made to the Alzheimer's Association of Beaufort, P. O. Box 1514 Beaufort, SC 29901 or Franciscan Center, P.O. Box 682*

Personal life[edit]

Campbell was born in November 1941. He is originally from Buffalo, New York and earned a Master of Science degree in Industrial Engineering and Operations Research from the University of Buffalo in 1966, where he has served as a trustee. After receiving a Bachelor of Sciences in Mathematics from Niagara University in 1963.[5] He is the recipient of honorary doctorates from both Niagara University and Canisius College,[6][4] Citizen of the year from The Buffalo News,[6] the 2013 Richard Cornuelle Award and the Encore.org 2014 Symetra Purpose Prize.[7]

Campbell started his career in 1963 with IBM and then left to join Computer Task Group.[5] He is married to Gay Wind Campbell and the couple have 4 children.

Honors and awards[edit]

- 2015 Wins the Points of Light Award
- 2015 St Vincent de Paul medal, Vincentian Heritage Convocation[8]
- 2014 Encore.org Purpose Prize Award winner
- 2013 Richard Cornuelle Award for Social Entrepreneurship, Manhattan Institute
- 2006 Encore.org Purpose Prize Fellow
- 1993 Man of the Year, Buffalo News

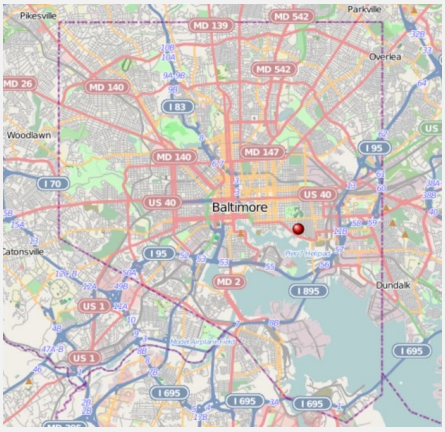
Canton, Baltimore, Maryland

Wikipedia Canton, Baltimore, Maryland

Wikipedia page - https://en.wikipedia.org/wiki/Canton%2C_Baltimore



2019-07-02-wikipedia-org-canton-baltimore-img1.jpg

2019-07-02-wikipedia-org-canton-baltimore.pdf /

Canton is a historic waterfront neighborhood in Baltimore, Maryland, United States. The neighborhood is along Baltimore's outer harbor in the southeastern section of the city, roughly two miles east of Baltimore's downtown district and next to or near the neighborhoods of Patterson Park, Fell's Point, Highlandtown, and Brewers Hill.

Canton is considered one of Baltimore's trendiest and vibrant neighborhoods, known for its family-friendly community, urban lifestyle and hot spot for the social scene. The inclusive neighborhood continues to see rapid growth as more development opportunities come into the area.[3] Since the late 1990s, the neighborhood has undergone significant gentrification and has been ranked the 16th most-gentrified zip code in the nation from 2000–2016.[4]

History

In 1785, Irish merchant John O'Donnell settled in Baltimore and began trading with merchants in the Chinese port of Guangzhou, then called Canton by English speakers. When O'Donnell purchased land, he named his plantation Canton.[5] In the late 18th century, O'Donnell's land was sold off by his son Columbus O'Donnell, William Patterson and Peter Cooper, and was developed by the Canton Company for the waterfront industry and blue-collar housing.[6]

A major feature of early Canton was Major David Stodder's shipyard, located at Harris Creek, with the most famous vessel being built the USS *Constellation*.[6]

During the early 19th century, European immigrants settled in the area. Welsh immigrants, primarily workers from South Wales, began settling in Baltimore in large numbers beginning in the 1820s. Welsh and Irish migrant workers composed a large portion of Baltimore's working class during the early and mid-1800s.[7] In 1850, a large community of copper workers from Wales settled in the neighborhood.[8] These workers established a Presbyterian church in 1865, located on Toone Street in Canton.[9] Subsequent groups of immigrants have included Germans, Poles and Ukrainians.

In the 2000s, as industry moved out, new housing and marinas have been developed along the waterfront and gentrification of the existing housing has occurred further inland.

Boundaries

Canton is bounded by Patterson Park and Eastern Ave to the north, Chester Street to the west, the waterfront to the south, and Conkling Street to the east. The streets are laid out in a uniform north to south and east to west directions, with the major exception of Boston Street, which runs along the Patapsco River waterfront.

Transportation

Canton is conveniently situated with easy access to Interstate 95, Interstate 895 and Boston Street and Eastern Avenues, which provide major surface routes to downtown Baltimore. Two high-frequency MTA bus lines (Gold and Navy) service Canton for direct access to the central business district and Penn Station. The south waterfront area provides a water taxi link to Locust Point.

Bus transportation to New York City and Washington, D.C. is available with frequent service at a nearby Eastern Bus stop on Ponca Street.

Landmarks

Many of the structures are included in the **Canton Historic District**, listed on the National Register of Historic Places in 1980.[6]

Canton's traditional center is O'Donnell Square, a small park bordered on the north and south by O'Donnell Street, to the east by South Potomac Street, and to the west by Linwood Avenue. O'Donnell Square is home to a number of lively bars and restaurants, gift shops, salons and other small businesses, as well as residences. Canton is also immediately adjacent to Patterson Park, a popular nearby attraction for local residents. In the 2000s, developments have added focus areas to the neighborhood, including the Canton Waterfront Park and Maryland Korean War Memorial, the rehabilitated American Can Company building, the Du Burns Soccer Arena, two marinas, a public boat launch, and new bars and restaurants. The Canton Dog Park, the first off-leash dog park in Baltimore, has been open for dog lovers since 2002.

The neighborhood is home to the many food and wine festivals, Light Night Canton, Baltimore's annual Ukrainian-American festival, summer concert series, and is a popular destination to view Baltimore Harbor July 4th fireworks. A premier shopping complex, The Shops at Canton Crossing, anchored by Target and Nordstrom Rack, has been serving local residents since 2013.

Notable churches in the area include the St. Casimir (Roman Catholic) Church, built c. 1926, the St. Michael the Archangel Ukrainian Catholic Church, and the (Episcopal) Church on the Square.

Enoch Pratt Free Library branch

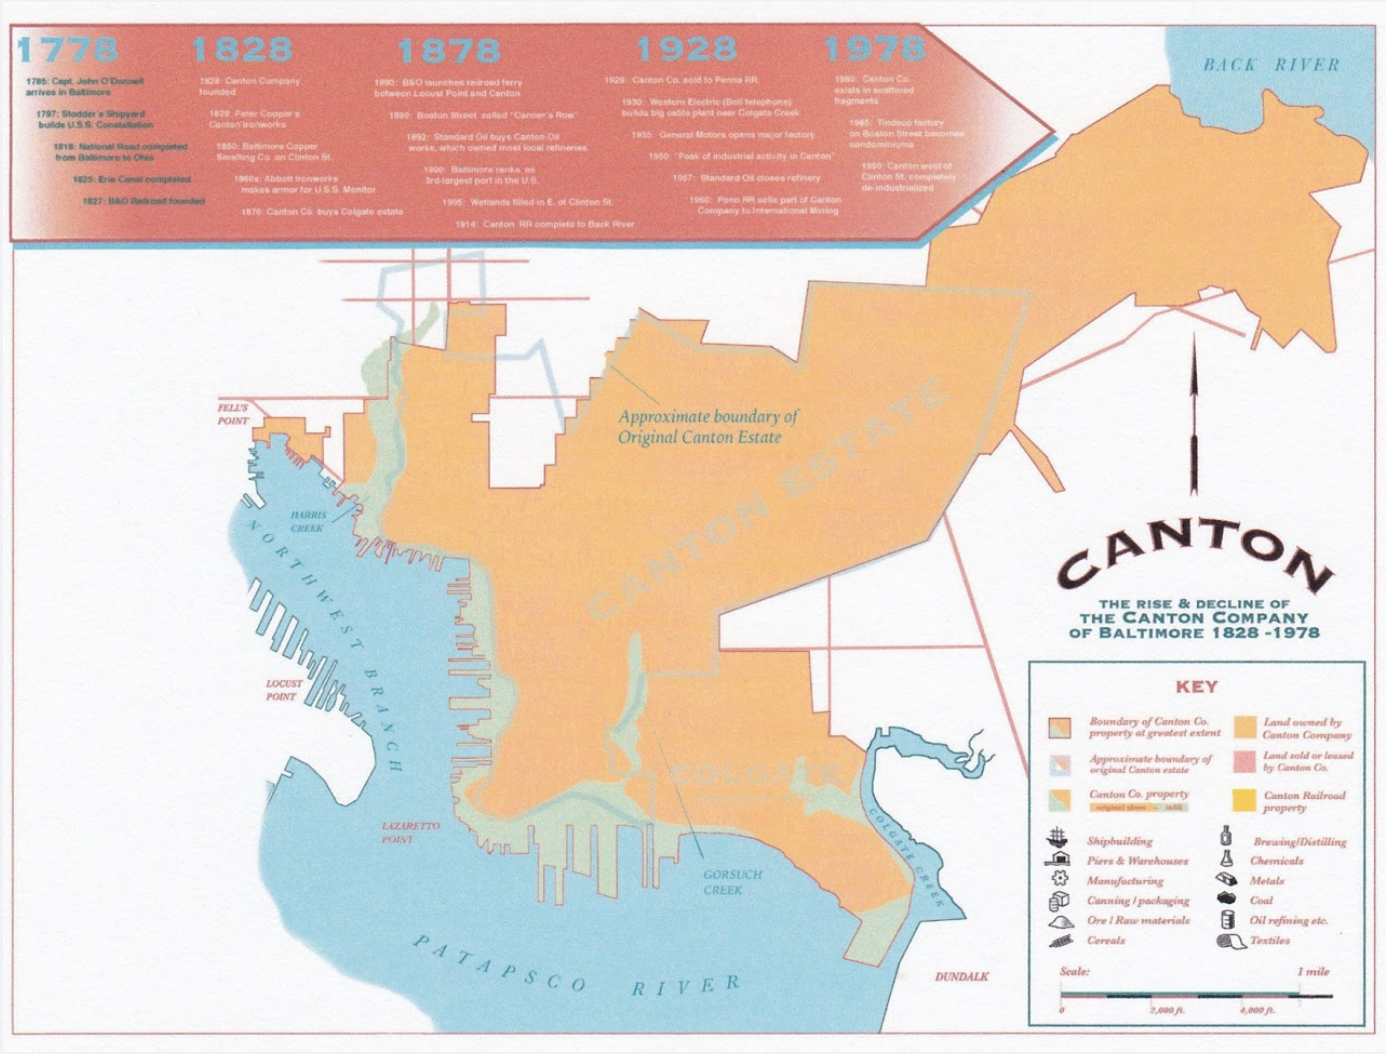
Canton's branch of the Enoch Pratt Free Library, Baltimore's first and in operation since 1866, is centrally located on O'Donnell Square.

A moored trash interceptor, the female-gendered Professor Trash Wheel (with appropriate googly eyes) can be found off the Boston Street Pier Park since December 2016. [10]

From the Canton Company to the Future

See [HW001U][GDrive]

According to the Baltimore Historical Society Canton became the Canton we now know because of the Canton Company that began in 1828 with the start of the Industrial Revolution that continued in Canton until well into the 1980s and many people feel that the Spirit of the Revolution continues even today. At one time, the Canton Company owned and leased more than 10,000 acres where industry could flourish under a benevolent company. Industries would come and go, but there was always another industry and a new idea that would replace it successfully. Today, we have an expanding Brewer's Hill Technology Area that is spreading east and north to fuse with the expanding Medical Complex taking place at Johns Hopkins Bayview Campus, and we have heard about a new company involved with the Personal Genome Project. Yes, the Canton Company is very much alive in spirit even today.



[HW001U][GDrive]

2018-05-cantoncove-net-29662421-10210449489945017-3553186085005398886-o.jpg /

H.L. Mencken and the Gunther Brewing Company

See [HW001U][GDrive]

Later on the Gunther Brewing Company would establish itself just south of the National Brewing Company on Conkling Street.

Prohibition applies to the period (1920-1933) in the history of the United States during which the prohibition of alcohol was enforced. Prohibition was instituted with ratification of the Eighteenth Amendment to the United States Constitution. This prohibited the manufacture, sale or transportation of intoxicating liquors in the United States. Congress would pass the “Volstead Act” to enforce the law.

However, most large cities were uninterested in enforcing the law, leaving an understaffed federal service to go after bootleggers involved in organized crime associated with this illegal activity.

Prohibition became increasingly unpopular during the Great Depression. The repeal movement got started and emphasized the enormous sums of much needed tax revenue and weakening the base of organized crime. The Repeal of Prohibition was accomplished with the passage of the Twenty-first Amendment to the United States Constitution in 1933.

In the Memoirs of Michael V.Lardner, Mr Frank Gunther and his brother, George, had a Brewery on Conkling Street just south of the National Brewing Company. They were looking for an office boy and hired Michael Lardner who was then 15 years old. When Michael was 17 years old, he became secretary to both brothers and was sent to school in 1919 to become a bookkeeper for the Gunther Brewery.

After prohibition set in, the Brewery made real beer and then pumped it back to the kettle to de-alcoholize it by boiling it off to reduce it to the required 1/2 of 1% alcohol. Many Gunther workers opted to work on the roofs of Gunther Company to inhale the vapors that were coming up!

With prohibition and good beer at the brewery, the Gunthers found a lot of “long lost friends” who wanted to come and get some real beer! It was Michael Lardner whose job it became to procure the food for parties throughout the days and evenings.

George Gunther would say, “Mike, you take charge and get any of the help from the employees you need.” Mike always had on hand 5 barrels of Chincoteague Oysters, two dozen Diamond Back Terrapins, a deer, a bear, various cheeses, celery by the crate, large cans of pretzels, pounds of raw beef, onions, and a good supply of rye and pumpernickel breads.

Dignitaries got wind of the real beer and sumptuous food and came. Governor Ritchie, Mayor Broening, Frank Kelly, Danny Loden……and H.L. Mencken who became the centerpiece for many parties to follow. The Saturday Night Club parties would last from 9 pm until 3 or 4 in the morning. The singing became very loud, especially when it came to the German Songs.

H.L. Mencken always led the singing that would go round and round the table with lots of hilarity at some of the impromptu compositions. They would always reminiscence about the Days of Canton-past which were vibrant days full of fun and adventure.

This spirit has never left Canton. Fells Point may have its ghost stories of sailors being hijacked to far-away places and being paid by the boom on return, but here in Canton there are many stories of real men and women, courageous and risk-taking, to go along with the real beer!

Captain John O'Donnell, the 18th century seafaring merchant, **founded the Baltimore community of Canton** on a fortune made through trade – including Turkish opium, according to historians – in the Chinese port of the same name.

O'Donnell, who brought cattle to Baltimore and goods from the Orient peculiar enough to attract George Washington's wallet, **died a rich man in 1805**, long before the legacy of his estate would employ tens of thousands of laborers while making many men much richer than he.

Early development in Canton included tracks for horse racing, one on the north side of Boston Street at Clinton in 1820 and another, in 1823, called "Potters Course" (later Kendall Track) on the south side of Boston and Clinton.

Near the foot of Clinton Street, in 1831, rose the 34-foot tall Lazaretto Lighthouse, with detached light keeper's house.

In May of 1840, the Whig party endorsed William Henry Harrison for president of the United States at the Kendall Track. Harrison was elected the ninth U.S. president, serving a mere month – the shortest term in American history – before succumbing to pneumonia.

Canton's transformation from agrarian to a slow but steady (and eventual roaring) industrialization proceeded from **the 1828 formation of the Canton Company, which coincided with the founding of the Baltimore and Ohio Railroad.**

In time, the combination of rails and docks would make the southeast Baltimore waterfront one of the greatest industrial and commercial powerhouses in the world.

A half-century after the Canton Company was chartered, historian James Thomas Scharf wrote, "The scheme indicated a comprehensive insight into the future greatness of Baltimore as a commercial emporium."

In his signal, 1874 work – The Chronicles of Baltimore: Being a Complete History of "Baltimore Town" and Baltimore City from the Earliest Period to the Present Time – Scharf observed that the Canton Company had been "attended with wonderful success.

"Wharves have been built, elevators constructed, railroads find their tide-water terminals, factories flourish and enterprise in a thousand different employments find encouragement and compensation."

A growing population of skilled and unskilled labor lived close enough to walk to work at broom factories, oyster shucking plants (Chesapeake bounty shipped in cans made nearby) and lumber yards.

The need for skilled craftsmen became so great that representatives of various Canton industries – particularly copper smelting – traveled through Europe enticing workers to move to Baltimore.

Which led to several blocks of Welsh families on South Clinton street to be known as "Copper Row."

Canton and its working class residents prospered from the vision of the Canton Company for well more than 100 years. At first, it was mere speculation viewed by some as a quick-buck "humbug."

Before long, the enterprise would become a darling of Wall Street, paying handsome dividends many times over initial investment for shares.

"A perfect storm of timing," said Raymond Bahr, a retired cardiologist who grew up in Canton and is keen to let others know how significant the neighborhood is to the growth of Baltimore. "It all came together because of the Canton Company."

It **began with Peter Cooper (1791-to-1883), the New York industrialist who tweaked a prototype of the steam locomotive to suit the needs of the B&O, whose financial promise had lured Cooper to Baltimore.**

"Cooper came up with a version that had a vertical boiler and a short wheel base that was able to negotiate the sharp curves of the line between Baltimore and Ellicott City," said James D. Dilts, author of The Great Road: The Building of the Baltimore and Ohio.

"It helped convince the company that steam power was appropriate for their railroad."

Cooper went in with two others on a 3,000 acre, $105,000 bite out of southeast Baltimore shoreline, much of it within the O'Donnell estate. According to reports of the time, the sale netted Cooper "the whole shore from the Fells Point Dock for three miles."

Following Cooper came a coalition of businessmen determined to develop the land the New Yorker had bought. The group included some of the biggest

names of the era, names which still reverberate in Baltimore. These men created the Canton Company, a real estate corporation chartered by the General Assembly in December, 1828.

The charter specified that a majority of the company's directors be citizens of Baltimore.

In addition to Cooper, the company was launched by Columbus O'Donnell, the ambitious and hard-working first son and heir of Canton founder John O'Donnell and a War of 1812 veteran; William Patterson, the international trader for whom Patterson Park (and whose daughter married Napoleon's little brother), Francis Price, Ely Moore, future New York City mayor Gideon Lee and a gentleman named John Ramsey.

At a time when planned development was rare – if not non-existent – the group's stated objective was to "improve the land, lay out streets, erect wharves, docks, slips, factories, stores and personal dwellings."

And make a pretty penny while doing so.

One of the first things Cooper did was drain the "swamp" and level hills along the shoreline. Ore was found in the muck, lots of it. Being a man of opportunity, Cooper established rolling mills and kilns – **the Canton Iron Works – near Harris Creek on Boston Street near Hudson Street**.

In 1830, Cooper designed and supervised the building of the Tom Thumb, the first American-built steam locomotive. It was an immediate sensation, made famous by its race with a horse. Because of its ability to navigate sharp curves and steep hills, Cooper's engine persuaded the B&O to commit to steam power.

Investors bought stock in the railroad and the relationship earned Cooper – a shrewd visionary of prodigious whiskers – the first of several fortunes.

Describing Canton as the perfect depot for coal from Pennsylvania and grain from Western Maryland and distant farms, Scharf wrote "the vast plains of the great West must find their outlet to the sea over railroads that center here …"

And over time created the manufacturing colossus of recent memory, the Canton your grandmother remembers if she was born between Boston Street and Eastern Avenue during the Great Depression.

A place of good jobs for the whole family if you knew the right people or lived around the corner.

"The American Can Company was a magical place to work," said Andy Mezensky, a kid from East Pratt Street who worked summers at the factory in the 1960s to pay for college. "Everyone made money and everyone was happy. It was the focal point of our lives."

Mezensky's father had already worked at the can company for more than a decade. The way that the younger Mezensky landed his well-paying union job at the corner of Boston and Hudson streets was both simple and symbolic of the way most industries did business in the provincial village on the southeast Baltimore waterfront: nepotism.

"They didn't hire off the street," you had to know someone," said Mezensky, now 71 and an established sculptor. "My father sent me in to get a job and I didn't tell them he already worked there. They wouldn't even talk to me. So I went back with my father and they hired me on the spot.

And that's how it rolled – like miles of tin sheets – for more than a century; a miracle neighborhood of bars and churches, factories, social clubs and ballfields enduring community born of the foresight of the Canton Company.

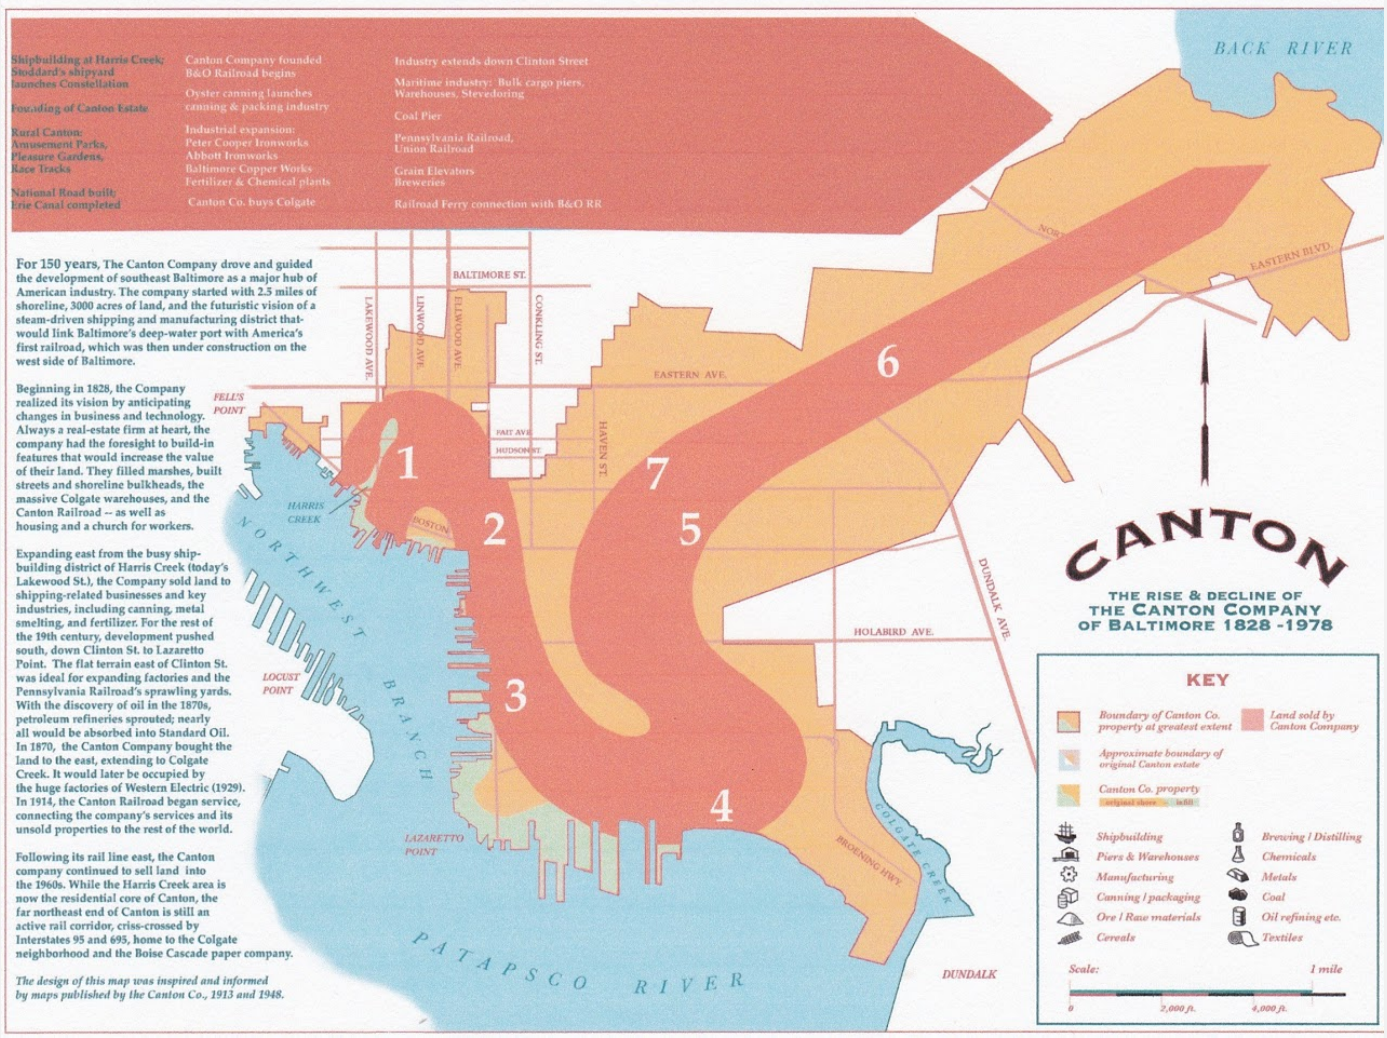
The Rise and Decline of the Canton Company

The Industrial Revolution began in Canton in 1828 just outside Baltimore and east of Harris Creek. It resulted from the Canton Company obtaining a unique Charter from the General Assembly of Maryland to take advantage of the 3,000 acres (recently purchased from the Captain O'Donnell Estate) in setting up an industrial neighborhood that would provide a stable force to work in local industry for decades to come.

It did not hurt that mobile steam power became available and was replacing stream power from the falls….. or that railroads for transportation were being perfected…. or that there were food needs that could be met with the canning and packing industries, the most successful being the Oyster Industry that helped to supply needed food to the '49ers in California and the soldiers in the Civil War being fought nearby.

The proximity to the Chesapeake Bay and the farms of the Eastern Shore of Maryland were a constant source for water and land produce to fuel these industries in Canton. The Smokestack Industry in Canton had begun. However, the Industrial Revolution would not end with the Smokestack Industries, but would expand and extend further south and east and last for many years into the 1980s.



2018-05-cantoncove-net-upload-rise-and-decline-of-the-canton-co-1828-1978.jpg / https://drive.google.com/open?id=1mubFfZmJ74w4xHUFE-e75-AfodvLpTWu

This map shows that the original footprint of 3,000 acres would grow even more with the purchase of 7,000 acres from the Colonel Colgate Estate and go further east to Back River. Along the way, industries would come and go but there would always be new industries to step up, flourish for a while, start to decline, and then give way to another industry cycle. The direction of this industrial flow can be seen in the map above and the various industries associated with each approximate time period are as follows:

(1) 1828-1878

- Wooden Historic Ships
- Oyster Industry
- Canning and Packing Industry
- Cooper (Abbott) Iron Company
- Railroad Companies
- Smokestack industries
- Can, Tin and Bottle Companies
- Breweries

(2) 1878-1928

- Oil Refineries
- Oil Engines
- Standard Oil Company, Humble Oil, Esso
- Copper Smelting and Refineries, American, Baltimore Copper

(3) Pennsylvania RR Coal Pier

- Fertilizer Companies
- Chemicals Company
- Stevedores Company
- Rukert Piers, Terminals and Warehouses
- Union Railroad Company
- Sand and Gravel Companies
- Port activities exporting and inporting
- Canton Railroad Company
- Lower Canton Piers

(4) 1928-1978

- Western Electric Company
- General Motors
- Lever Brothers Soap Products
- Later, Amazon Companies

(5) Brewers Hill

- Personal Genome Company
- AOL and other Tech Companies
- Pemco Corporation
- Anchor Post Products
- Cross and Blackwell Company

(6) The Canton Center Industrial Park

Eastern Stainless Steel Company

In summary, these companies represent only a fraction of the many companies that took advantage of the Canton Company over close to 190 years that the Company would stay in existence.

The purpose of this post is to demonstrate that the Canton Company dynamically kept companies coming and helping with their success by either entering into partnership with them or creating conditions that would benefit their products.

Overall, the Canton Company is the reason behind what Canton is all about today and the industrial success story continues east as the fusion with medicine from the Johns Hopkins Bayview Campus is about to take place. Keep an eye on this futuristic endeavor!

August 10, 1991 (aged 44)

Room 517, Sheraton Hotel, Martinsburg, West Virginia

Nationality

American

Alma mater

Providence College

Occupation

computer-trade magazine owner, writer

Spouse(s)

Terrill Pace (divorced)

Children

1

Joseph Daniel Casolaro (June 16, 1947 – August 10, 1991) was an American freelance writer who came to public attention in 1991 when he was found dead in a bathtub in room 517 of the Sheraton Hotel in Martinsburg, West Virginia, his wrists slashed 10–12 times. The medical examiner ruled the death a suicide.[1]

His death became controversial because his notes suggested he was in Martinsburg to meet a source about a story he called "the Octopus." This centered on a sprawling collaboration involving an international cabal, and primarily featuring a number of stories familiar to journalists who worked in and around Washington, D.C. in the 1980s—the Inslaw case about a software manufacturer whose owner accused the Justice Department of stealing its work product, the October Surprise theory that during the Iran hostage crisis Iran deliberately held back American hostages to help Ronald Reagan win the 1980 presidential election, the collapse of the Bank of Credit and Commerce International, and Iran–Contra.[2]

Casolaro's family argued that he had been murdered; that before he left for Martinsburg, he had apparently told his brother that he had been frequently receiving harassing phone calls late at night; that some of them were threatening; and that if something were to happen to him while in Martinsburg, it would not be an accident. They also cited his well-known squeamishness and fear of blood tests, and stated they found it incomprehensible that if he were going to commit suicide, he would do so by cutting his wrists a dozen times.[3] A number of law-enforcement officials also argued that his death deserved further scrutiny, and his notes were passed by his family to ABC News and *Time Magazine*, both of which investigated the case, but no evidence of murder was ever found.[4][5]

Early life and career[edit]

Casolaro was born into a Catholic family in McLean, Virginia, the son of an obstetrician, and the second of six children. One of his siblings fell ill and died

shortly after birth. A younger sister, Lisa, died of a drug overdose in San Francisco's Haight-Ashbury in the 1960s. Casolaro attended Providence College until 1968. He married Terrill Pace, a former Miss Virginia. The couple had a son, Trey, and divorced after ten years, with Casolaro granted legal custody of his son.[6]

Casolaro's interests included amateur boxing, writing poems and short stories, and raising pure bred Arabian horses. He also dabbled in journalism, looking into issues such as the Soviet naval presence in Cuba, the Castro intelligence network, and Chinese communist smuggling of opium into the U.S. according to his own *curriculum vitae* (though it remains unclear how much he had published).[6] At the time of his death, he had written and published one novel, *The Ice King*, with Whitmore Publishing Co.

Towards the end of the 1970s, he dropped his interest in journalism and acquired a series of computer-industry trade publications, which he began selling towards the end of the 1980s. In early 1990, he decided to take up journalism again and, soon after, took an interest in the Inslaw case, of which his IT contacts had made him aware.[6]

Research[edit]

Shortly before his death, Casolaro told people that he was nearly ready to reveal a wide-ranging conspiracy involving the Inslaw case, Iran-Contra, the alleged October Surprise conspiracy, and the closure of BCCI.[7] David Corn writes in *The Nation* that the papers Casolaro left behind reveal few clues, except that he was in over his head, but was tenacious.[8]

His papers included old clippings, handwritten notes that were hard to read, and the names of former CIA officers and arms dealers. Corn writes that the notes show Casolaro was influenced by the Christic Institute and that he had pursued material fed to him by a reporter who worked for Lyndon LaRouche.[8] Richard Fricker writes in *Wired* that Casolaro had been led into a "Bermuda Triangle of spooks, guns, drugs and organized crime."[9]

Inslaw case[edit]

Main articles: Inslaw, Michael Riconosciuto, and Earl Brian

Ron Rosenbaum writes that the Inslaw story alone is enough to drive a sane man to madness. "If they ever make a movie of the Inslaw suit," he writes, "it could be called *Mrs. and Mrs. Smith Go to Washington and Meet Franz Kafka*."[6] Inslaw's founder, William A. Hamilton, in a previous position with the U.S. Justice Department, had helped develop a program called PROMIS, short for Prosecutor's Management Information System. PROMIS was designed to organize the paperwork generated by law enforcement and the courts. After he left the Justice Dept, Hamilton alleged that the government had stolen PROMIS and had distributed it illegally, robbing him of millions of dollars. The department denied this, insisting that they owned it because Hamilton had developed it while working for them. As a result of this dispute, Hamilton and the department had been in litigation since 1983. A federal bankruptcy judge ruled in 1988 that the department had indeed taken the software by "trickery, fraud, and deceit," a decision upheld by a federal district court in 1988, but overturned on appeal in 1991.[8]

A conspiracy theory developed around the case, with allegations that "back doors" had been inserted into the software so that whomever the Justice Department had sold it to could be spied upon. The major source on the conspiracy-theory aspect of the case, both for Hamilton and, later, for Casolaro, was Michael Riconosciuto, described by Rosenbaum as a "rogue scientist/weapons designer/platinum miner/alleged crystal-meth manufacturer... ."[6] Riconoscuito had been introduced to a friend of Casolaro's by Jeff Steinberg, a longtime top aide in the LaRouche organization.[8]

Riconosciuto told Bill Hamilton that he and Earl Brian, a director of Hadron, Inc., a government consulting firm, had paid $40 million to Iranian officials in 1980 to persuade them not to release the American hostages before the conclusion of the presidential election that saw Ronald Reagan elected president of the United States; this is the claim now known as the "October Surprise". In exchange for his helping the Reagan administration, Brian was allegedly allowed to profit from the illegal distribution of the PROMIS system, according to Riconoscuito.[4][10] Brian, a close friend of then-Attorney General Ed Meese, has denied any involvement in either October Surprise or the Inslaw case.

In addition to this allegation, Riconosciuto also claimed — in a March 21, 1991 affidavit submitted to the court in the Inslaw case[11] — that he had modified Inslaw's software at the Justice Department's behest so that it could be sold to dozens of foreign governments with a secret "back door," which allowed outsiders to access computer systems using PROMIS. These modifications allegedly took place at the Cabazon Indian Reservation near Indio, California. Because the reservation was sovereign territory where enforcement of U.S. law was sometimes problematic, Riconosciuto further claimed that he had worked on weapons programs there for the Wackenhut Corporation, such as a powerful "fuel air explosive". On March 29, 1991, eight days after submitting the affidavit, Riconosciuto was arrested for, and later convicted of, distributing methamphetamine and methadone, charges that he said were a set-up to keep him from telling his story.[8][12][13]

In the summer of 1990, Casolaro arranged to meet Bill Hamilton, expressing an interest in pursuing the Inslaw story. Hamilton gave Casolaro a 12-page memo Riconoscuito had written detailing his allegations. Rosenbaum writes that, "The moment he got his hands on that maddening memo, with its maze of illusion and reality, was the moment Danny's life changed and he began his descent into the obsession that would lead to his death. He was slowly, then rapidly, sucked into a kind of covert-ops version of Dungeons & Dragons, with that memo as his guide and Michael Riconosciuto as his Dungeon Master."[6]

Final days[edit]

On August 8, 1991, Casolaro arrived in Martinsburg, West Virginia to meet a source who, he said, had promised to provide an important missing piece of his story.

On August 5, 1991, Casolaro phoned Bill McCoy, a retired CID officer to tell him that *Time* magazine had assigned him an article about the Octopus. He further claimed to be working with reporter Jack Anderson, and that publishers Little, Brown and Time Warner had offered to finance the effort. All of these claims were later shown to be false:[1] Little and Brown, for example, had rejected his Octopus manuscript over a month earlier.[6]

On the same day, Casolaro's friend Ben Mason agreed to talk to Casolaro about his finances. A few days later, Casolaro showed Mason a 22-point outline for his book and expressed frustration at having been tied up with a literary agent who was unable to sell it for the last eighteen months. He also allegedly complained about his sleep being disturbed for the previous three months by calls during the night.[1]

The following day, a neighbor of Casolaro's and long-time housekeeper, Olga, helped Casolaro pack a black leather tote. She remembers him packing a thick sheaf of papers into a dark brown or black briefcase. Casolaro said he was leaving for several days to visit Martinsburg, West Virginia, to meet a source who

sheaf of papers into a dark brown or black briefcase. Casolaro said he was leaving for several days to visit Martinsburg, West Virginia, to meet a source who promised to provide an important missing piece to his story. This was the last time Olga saw him. Olga told *The Village Voice* that she answered several threatening telephone calls at Casolaro's home that day. She said that one man called at about 9:00 a.m. and said, "I will cut his body and throw it to the sharks". Less than an hour later, a different man said: "Drop dead." There was a third call, but Olga remembered only that no one spoke and that she heard music as though a radio were playing. A fourth call was the same as the third, and a fifth call, this one silent, came later that night.[1]

Last known sightings[edit]

According to *The Village Voice*, Casolaro's whereabouts between late in the day of August 8 and the afternoon of August 9 are unknown. The day before he died, according to *The Martinsburg Morning Journal*, he ate at a Pizza Hut, where he told the waitress he liked her eyes and quoted *The Great Gatsby* to her.[14] He met Honeywell engineer William Richard Turner at the Sheraton at about 2:30 p.m. on August 9. Turner says he gave Casolaro some documents, and that they spoke for a few minutes. Witnesses reported that Casolaro spent the next few hours at a Martinsburg restaurant. A bartender there told police that he had seemed lonely and depressed. The police further learned that Casolaro was seen at Heatherfields, the cocktail lounge at the Sheraton, at around 5 p.m. with a man described by a waitress as "maybe Arab or Iranian."[1]

At about 5:30 p.m. that night, Casolaro happened to meet Mike Looney who rented the room next to Casolaro's room 517. They chatted on two occasions—first at about 5:30 p.m. and then again at about 8:00 p.m. Looney later explained, "[Casolaro] said he was there to meet an important source who was going to give him what he needed to solve the case." According to Looney, Casolaro claimed that his source was scheduled to arrive by 9:00 p.m. Around that time, Casolaro left Looney, explaining that he had to make a telephone call. He returned a few minutes later and said that his source might have "blown him off." Casolaro and Looney talked until about 9:30 p.m. At about 10.00 p.m., Casolaro bought coffee at a nearby convenience store. That was the last time anyone reported seeing him alive.[1]

Death[edit]

At about noon on August 10, 1991, housekeeping staff discovered Casolaro naked in the bathtub of room 517. His wrists had been slashed deeply. There were three or four wounds on his right wrist and seven or eight on his left. Blood was splattered on the bathroom wall and floor; and according to Ridgeway and Vaughn, "the scene was so gruesome that one of the housekeepers fainted when she saw it."[1]

Under Casolaro's body, paramedics found an empty Milwaukee beer can, two white plastic liner-trash bags, and a single edge razor blade. There was also a half-empty wine bottle nearby. Ridgeway and Vaughan write that nothing was placed in the bathtub drain to prevent debris from draining away, and none of the bathwater was saved.[1] Other than the gruesome scene, the hotel room was clean and orderly. There was a legal pad and a pen present on the desk; a single page had been torn from the pad, and a message written on it: "To those who I love the most: Please forgive me for the worst possible thing I could have done. Most of all I'm sorry to my son. I know deep down inside that God will let me in."[6]

Based on the note, the absence of a struggle, no sign of a forced entry, and the presence of alcohol, police judged the case a straightforward suicide. After inspecting the scene, they found four more razor blades in their envelopes in a small package. Police interviews further revealed that no one had seen nor heard anything suspicious. The Martinsburg police contacted authorities in Fairfax, Virginia, who said they would notify Casolaro's family.

Police investigation[edit]

The first autopsy was performed on Casolaro's body at the University of Virginia on August 14, 1991. The coroner determined that blood loss was the cause of death, and that death had occurred from one to four hours before the body was discovered, or roughly between 8:00 a.m. and 11:00 a.m. on August 10.[1]

The day after Casolaro's body was found, *Village Voice* editor Dan Bischoff received an anonymous telephone call alerting him to Casolaro's death.[8] By Tuesday, August 13, Ridgeway and Vaughan write, the "rumors were flying,...and by the next day, the crazies started coming out of the woodwork. There were vague unsubstantiated rumors that the Mafia was somehow involved, and the wildest story even suggested that the undertaker was an employee of the CIA, hired to clean up after an agency assassination." Even at the funeral, they write, the family felt "engulfed by mysteries." As the ceremony drew to a close, a highly decorated military officer in U.S. Army dress reportedly arrived in a limousine. Accompanied by another man in plain clothes, the military man approached the coffin just before it was lowered into the ground, laid a medal on the lid, and saluted. No one recognized either man and, to this day, they have never been identified.[1] Further, Casolaro was known to have complained numerous times about threatening or unsettling phone calls directed at him, often occurring late at night, including those received by his housekeeper during his absences from his home.

After Casolaro's death was reported by several mainstream news organizations, police re-examined room 517. The adjacent rooms had been rented the evening of Casolaro's death — one by Mike Looney, the other by an unnamed family. No one reported hearing anything unusual either on the night of August 9 or the morning of August 10. In January 1992, about five months after Casolaro's death, Dr. Frost of the Virginia state medical examiner's office performed another autopsy; he returned a second suicide verdict, citing blood loss as the cause of death. Frost said there was evidence of the early stages of multiple sclerosis, but the degree of severity was probably minor. Toxicology analysis uncovered traces of several drugs: antidepressants, acetaminophen, and alcohol. He wrote: "There was nothing present in any way that could have incapacitated Casolaro so he would have been incapable of struggling against an assailant, let alone been sufficient to kill him."[1]

Ron Rosenbaum, a journalist acquaintance of Casolaro's, speculated in *Vanity Fair* that Casolaro may have intended his suicide to appear to be murder triggered by his research, in order to have others look into the story after his death.[6]

Later investigations showed that the FBI misled Congress about investigating Casolaro's death. Members of an FBI task force looking into Casolaro's death "questioned the conclusion of suicide" and recommended further investigation. This level of doubt "was especially significant, because even at that time (December 1992), it was undertood that to express those views risked one's career."[15] FBI documents show that some files on Casolaro are being withheld from public release, which is contradicted by the FBI saying the files are missing entirely.[16]

In popular culture[edit]

Dominic Orlando, Casolaro's cousin, wrote a play based on Casolaro's story in 2008 called *Danny Casolaro Died For You*.[17]

In January 2013, Aviation Cinemas Productions and Caliber Media optioned the film rights to the story of Danny Casolaro based on Orlando's play. Adam Donaghey, Eric Steele, Dallas Sonnier and Jack Heller are set to produce with Eric Steele directing. Production was set to begin in 2015.[18]

[HK0045][GDrive]

CenturyLink, Inc. is a global technology company headquartered in Monroe, Louisiana that offers communications, network services, security, cloud solutions, voice and managed services. The company is a member of the S&P 500 index and the Fortune 500.[6] Its communications services include local and long-distance voice, broadband, Multi-Protocol Label Switching (MPLS), private line (including special access), Ethernet, hosting (including cloud hosting and managed hosting), data integration, video, network, public access, Voice over Internet Protocol (VoIP), information technology and other ancillary services.[7] CenturyLink also serves global enterprise customers across North America, Latin America, EMEA and Asia Pacific.[8]

Products and Services

CenturyLink's products and services focus on 3 key segments: Enterprise Business, Small Business, and Residential.[9]

CenturyLink Enterprise Business

CenturyLink Enterprise Business provides products and services around Network, Cloud, Security, Voice, and Managed Services to enterprise customers.[10] CenturyLink's Network services include SD WAN, MPLS/IPVPN, Hybrid WAN, Ethernet, Internet Access, Wavelength services, Dark Fiber and Private Lines.[11] CenturyLink Cloud provides Big Data as a Service, Internet of Things (IoT), Multi-Cloud Management, Private Cloud, Public Cloud, Bare Metal, SaaS Applications and Cloud Connect.[12] CenturyLink Security monitors more than a billion security events daily.[13] Services include: Cloud, Infrastructure, DDoS, Web Application, Email, and Web Security. The company also provides Analytics and Threat Management, Risk and Compliance support and Threat Research Labs.[14] CenturyLink offers voice products ranging from traditional landlines to Unified Communications and Collaboration (UC&C) services and was recognized in 2018 by Frost & Sullivan for "growth excellence in VoIP access and SIP Trunking".[15] CenturyLink's Managed Services include Advanced Professional Services, IT consulting and strategic partnerships.[16]

CenturyLink Small Business

CenturyLink Small Business provides products and services around Internet, Phone, TV and Cloud Applications.[16]

CenturyLink Residential

CenturyLink Residential provides Internet (including Gigabit Fiber), Voice, and TV, via partnership with DirecTV.[17] The company also offers bundling with Verizon Wireless.[18]

- Wisconsin
- Wyoming

Fiber

CenturyLink Fiber is a fiber to the premises service in the United States, providing broadband Internet and Prism TV to a small and very slowly growing number of locations. The service was first introduced to Omaha, Nebraska,[20] and next rolled out to Las Vegas, Nevada,[21] with plans for expansion to several other markets.[22] Unlike the company's existing high speed Internet deployments, which utilize fiber-to the node/neighborhood to increase the speed of ADSL2+ speeds up to 20/2 Mbit/s, Vectored VDSL2+ speeds up to 140/10Mbit/s, in these markets CenturyLink now installs their fiber optic cable all the way to the home or business with speeds up to 1,000 Mbit/s download and 1,000 Mbit/s upload[23] using Calix Optical Network Terminals.[24] On Feb. 2, 2014, CenturyLink announced the availability of Gigabit fiber service to multi-tenant businesses in Salt Lake City and surrounding communities.[25] On Aug. 5, 2014, CenturyLink announced the expansion of its gigabit fiber service to 16 additional markets.[26] On Sep, 15, 2015, CenturyLink announced the expansion of its gigabit fiber service to residential and business customers in six additional states, increasing the company's service coverage to select areas of 17 states.[27]

Data centers

On May 2, 2017 CenturyLink, Inc. completed the previously announced sale of its data centers and colocation business to funds advised by BC Partners, in a consortium including Medina Capital Advisors and Longview Asset Management. The deal was worth approximately $1.86 billion with CenturyLink

retaining an approximately 10% equity stake in the consortium's newly formed global secure infrastructure company, Cyxtera Technologies.[9]

Organizational structure [as of Jan 2, 2020]

CenturyLink is the second largest U.S. communications provider to global enterprise customers. CenturyLink has customers in more than 60 countries.[54]

- Jeff Storey[55] - Chief Executive Officer
- Shaun Andrews[56] - Executive Vice President, Product Management and Chief Marketing Officer
- Richard Batelaan[57] - Executive Vice President, North American Operations
- Neel Dev[58] - Executive Vice President and CFO
- Andrew Dugan[59] - Chief Technology Officer
- Stacey W. Goff[60] - Executive Vice President, General Counsel and Chief Administrative Officer
- Fletcher Keister[61] - Chief Transformation Officer
- Lisa Miller[62] - President, Wholesale, Indirect Channels and Alliances
- Edward Morche[63] - President, Strategic Enterprise and Government Markets
- Maxine L. Moreau[64] - President, Consumer Markets
- Laurinda Pang[65] - President, International and Global Accounts Management
- Scott A. Trezise[66] - Executive Vice President, Human Resources

Acquisitions

File:CenturyLinkCombinedCoverageMap.gif

CenturyLink's combined coverage following Embarqacquisition. Dark fiber and lit fiber assets are shown

On October 27, 2008, Embarq announced that it would be acquired by CenturyTel, Inc. in an all-stock transaction valued at about $6 billion.[67][68] CenturyTel's CEO Glen Post would remain CEO of the merged company following the acquisition,[69] and remained CEO as of 2018.[70] Embarq was the former landline business of Sprint and served cities in 18 states, including Nevada, Florida, North Carolina and Ohio.[71] The deal made CenturyTel the third-largest landline phone provider in Pennsylvania behind Verizon (through both Verizon Pennsylvania and Verizon North) and Comcast.

Network map of combined Qwestand CenturyLink assets

On April 22, 2010, CenturyLink (at this point still legally known as CenturyTel, Inc.) announced it would acquire Qwest in a stock-for-stock transaction.[72] Under the agreement, CenturyLink would swap 0.1664 of its shares for each share of Qwest; as a result, CenturyLink shareholders prior to the merger wound up with 50.5% share of ownership in the combined company, while former Qwest shareholders gained the remaining 49.5%.[73] The valuation of CenturyLink's purchase was $12 billion.[67] The merger was completed on April 1, 2011.[74][75]

The addition of Qwest allowed CenturyLink to become the third largest telecommunications company in the United States, and the largest landline phone provider in the state of Colorado.[70] The new company has 17 million access lines, 5 million broadband customers, and 1.4 million video subscribers across 37 states.[76] The merger also made CenturyLink owner of one of the so-called Baby Bells: Qwest included what was once US West, the Baby Bell for much of the western United States.

On July 15, 2011,[71] CenturyLink acquired Savvis, Inc., a global provider of cloud infrastructure and hosted IT services for $2 billion, which represented all outstanding shares of Savvis common stock at $40 per share.[67][77] This acquisition allowed CenturyLink to provide expanded managed hosting and cloud services.[78]

On December 4, 2012,[79] CenturyLink launched an integrated suite of cloud services called savvisdirect.[80] Savvisdirect was an expansion of CenturyLink's portfolio of Savvis cloud services and includes cloud application hosting,[81] cloud servers,[82] cloud storage,[83] and private cloud[84] for small businesses, IT administrators and developers. CenturyLink later shuttered the savvisdirect subsidiary, consolidating their cloud service offerings internally.

On October 16, 2012 Savvis acquired ITO Business Division of Ciber thereby adding managed services to the portfolio.[85]

On June 14, 2013, CenturyLink announced the acquisition of AppFog, a Portland-based Platform as a Service used by over 100,000 developers to automate the deployment of software on public clouds such as Amazon Web Services and OpenStack.[86]

On November 19, 2013, CenturyLink announced the acquisition of Tier 3, a Seattle-based infrastructure as a service (IaaS), platform, and advanced cloud management company[87] based on Cloud Foundry.[88]

On December 8, 2014, CenturyLink announced the acquisition of DataGardens, Inc., a Disaster Recovery as-a-Service (DRaaS) provider based in Edmonton, Alberta, Canada.[89]

On December 11, 2014, CenturyLink announced the acquisition of Cognilytics, a predictive analytics and big data service provider.[90]

On March 30, 2016, CenturyLink announced the acquisition of netAura, a security services company that focuses on cybersecurity, security information and event management (SIEM), analytics and vulnerability management.[91]

On January 9, 2017, CenturyLink announced the acquisition of Edison, New Jersey-based SEAL Consulting, a leading SAP services provider. This expanded CenturyLink's existing integrated SAP capabilities of hosting and managed services to include integration and software implementation.[92]

On October 31, 2016, CenturyLink announced its intent to acquire Level 3 Communications in a deal valued at around $25 billion.[93] After securing the necessary regulatory approvals, CenturyLink closed the transaction on November 1, 2017.[94]

History

The earliest predecessor of CenturyLink was the Oak Ridge Telephone Company in Oak Ridge, Louisiana, which was owned by F. E. Hogan, Sr. In 1930, Hogan sold the company, with 75 paid subscribers, to William Clarke and Marie Williams, for $500. They moved the switchboard to the Williams family front parlor. In 1946, the Williams' son, Clarke McRae Williams, received ownership of the family's telephone company as a wedding gift.[96] In 1947, Clarke Williams learned the telephone company in Marion, Louisiana was for sale. With a loan from business associate Joe Sydney Carter, Clarke purchased the Marion Telephone Company and eventually made it his base of operation as he grew his company through more acquisitions. CenturyLink still maintains offices in the former headquarters building.[97] The company remained as a family-operated business until it became incorporated in 1968.[98][99]

1967-1999

By 1967, Oak Ridge Telephone Company served three states with 10,000 access lines. That year, the company was incorporated as Central Telephone and Electronics. Clarke M. Williams served as president and chairman of the board.[100] Between 1972 and 1975, Clarke gradually moved his headquarters from Marion to Monroe, Louisiana, to access the larger employee base and to be near the airport.

In 1971, the company was renamed as Century Telephone Enterprises, Inc.[101][102] In 1972, Century Telephone acquired the La Crosse Telephone Corporation, of Wisconsin.[103]

On October 24, 1978, Century Telephone moved to the New York Stock Exchange for the first time and began to trade under the ticker symbol CTL.[104]

Century Telephone performed well during the long bear market of the 1970s, as its stock rose over fourfold. The company provided telephone service in parts of 14 states by that time.[105]

In 1981, Century Telephone acquired War Telephone in West Virginia.[106]

In 1982, Century Telephone's earnings peaked at $14 million, then declined in 1983 following the early 1980s recession, and finally began to recover in 1984. However, the 1983 decline led to a loss of half the value of the company's stock in 1984.[107]

In 1985, both earnings and the stock price had recovered to new record highs. But by then, the company had accumulated $206 million in long-term debt.[108] Century Telephone sold the operations of War Telephone and two other companies to Colonial Telephone for $4.66 million.[109]

In 1987, the stock price nearly doubled from its low that year, and from its old 1982 record high, before falling back by a third in the 1987 stock market crash. Earnings had steadily grown each year from their 1983 low, and by 1987 reached nearly US$20 million.[110]

In 1989, Century Telephone Enterprises acquired Universal Telephone, Inc. for US$90 million in cash.[111] During the late 1980s the company began a long trend in which it performed extremely well. The stock split three-for-two twice in this period, as earnings steadily grew, through the 1990-1991 recession, and by year-end 1991, they reached nearly US$40 million, double from what they had been in 1987.[112]

In 1992, Century Telephone acquired Central Telephone Company of Ohio, a Centel subsidiary, for $135 million. The acquisition served more than 65,000 access lines, and added 20% to Century's access line total. Also that year Glen F. Post III became Chief Executive Officer and, named Vice Chairman of the Board of Century Telephone.[113]

In 1993, Century Telephone revenues were over $425 million, up from about $350 million in 1992. 1993 earnings were nearly $80 million, up from about $70 million in 1992, excluding a nearly $16 million charge in 1992 due to the cumulative effect from an accounting change that year.[114][115] Also in 1993 the company split its stock three-for-two yet again. However, by that time, the company had accumulated nearly $520 million in long-term debt.[116]

By 1995, Century Telephone Enterprises had been added to the S&P MidCap 400 index. Earnings had continued their steady growth trend through the 1994 economic soft landing, and by 1995 they reached over US$115 million. But the long-term debt continued to grow as well, reaching US$623 million that year.[117]

In 1997, Century Telephone acquired Delta Security Alarm Co., Inc. of Monroe, Louisiana, and its largest acquisition up until that time, Pacific Telecom, doubling its size with 660,000 additional telephone access lines in 12 states.[118] Pacific Telecom, Inc., would continue existence and was renamed CenturyTel of the Northwest, Inc.

In 1998, Century Telephone split its stock three-for-two once again. The company acquired another Monroe, Louisiana security company, Century Protection Systems, and also acquired 89,000 access lines and 19 exchanges in 21 northern Wisconsin communities from Ameritech. The affected customers had formerly been served by Wisconsin Bell. Ameritech's directory publishing operations serving those customers were also acquired.[119]

In 1999, the company was renamed as CenturyTel, Inc.[120] It split its stock three-for-two once more, and was added to the Standard & Poor's 500 Index that year.[121]

2000-Present

In 2000, CenturyTel acquired 230,500 GTE lines in Arkansas, and also bought 127,000 GTE lines in Missouri in partnership with Spectra Communications.[122][123] In Wisconsin, it acquired 133,000 additional lines, and 70,500 access lines for US$195 million from Verizon. That year CenturyTel also bought 62,650 lines for US$170 million in partnership with Telephone USA of Wisconsin, LLC.[124]

In 2001, CenturyTel acquired CSW Net, Inc. of Russellville, Arkansas, and fended off a hostile take-over attempt by ALLTEL, Inc.[125][126]

In 2002, the son of the company's original founder and Chairman of the Board Clarke M. Williams died. He was succeeded by then Vice Chairman Glen F. Post III. The company sold its wireless business to ALLTEL, to become a pure-play rural local exchange carrier. Also that year CenturyTel acquired 300,000 Verizon access lines in Alabama, and 354,000 Verizon access lines in Missouri, bringing its total operations to 22 states with 2.5 million access lines.[127]

In 2003, CenturyTel acquired half ownership of SkyComm International, Inc. in Houston, Texas, in March, to form a satellite teleport for its global Network Access Point (NAP) system. In June, CenturyTel also acquired the fiber network of Digital Teleport, Inc., a 5,700-mile (9,200 km) route running from Illinois to Texas, and adjoining states.[128] CenturyTel renamed the network company LightCore.[129] Closing out the year, in December CenturyTel acquired the Midwest Fiber Optic Network (MFON) from Level 3 Communications, Inc. in December, a stand-alone system in the same core central states as LightCore.[130]

In August 2004, it partnered with EchoStar Communications Corporation for DISH Network multi-channel digital TV.[131] In September, CenturyTel began a relationship with Cingular Wireless.[132]

In 2005, CenturyTel began a wireless voice and data service, and bought a number of fiber networks in the central United States, from KMC Telecom Holdings, Inc.[133]

In 2006, CenturyTel sold its Arizona assets to Hopi Telecommunications, Inc., bringing total operations to 23 states.[134]

In May 2007, CenturyTel acquired Madison River Communications, based out of Mebane, NC and parent company to four LECs (AL, GA, IL, and NC) as well as CLEC operations in IL, LA, and NC. The LECs included Mebtel Communications, a telephone company serving Alamance County, North Carolina;[135][136] GulfTel Communications, based out of Foley, AL and serving Baldwin and surrounding counties;[137][138] Coastal Communications, based out of Hinesville, GA; and Gallatin River Communications, serving the Dixon, Galesburg, and Pekin areas of IL.

In late 2007, the Customer Respect Group, an international research and consulting firm that focuses on how corporations treat their online customers, ranked CenturyTel the best among six leading communications providers.

On June 2, 2009, a press release announced that the combined CenturyTel/Embarq entity would be called CenturyLink.[139] Denver-based Monigle Associates was retained to formulate the new brand strategy. The acquisition was completed on July 1, 2009.[140]

On October 19, 2009, CenturyTel and Embarq brandings were retired, and all business was officially conducted under the CenturyLink banner, continuing to trade on the NYSE under the CenturyTel stock ticker CTL. The new corporate name, CenturyLink, Inc., did not become official until May 2010.

[...

2020 name change to Lumen

See [HK0044][GDrive]

On September 14, 2020, **CenturyLink, Inc** announced they have rebranded to [**Lumen Technologies, Incorporated**]. Effective with the opening of the trading day on Sept. 18, 2020, the company stock ticker changed from CTL to LUMN. For residents and small businesses, the CenturyLink brand will continue to be used for traditional copper-based services. *Quantum Fiber* branding will be used for fiber-based products and services.[66]

...]

Criticism and controversy

The Federal Communications Commission ordered CenturyLink to pay a record $16 million for failing to alert authorities of a preventable programming error that left nearly 11 million people in seven states without access to emergency services for six hours in 2014.[143][144]

In December 2018, CenturyLink faced criticism for requiring residential customers in Utah to, via DNS hijacking, view and acknowledge a notice advertising its security and parental control software, before they could connect to the internet again. The provider claimed that this was required by a recently-enacted state law, which requires all ISPs to inform users that they provide "the ability to block material harmful to minors". Bill sponsor and Utah State Senate member Todd Weiler stated that the law did not require that service be disrupted until the notice is acknowledged; the law only requires that this notice be delivered in a "conspicuous" manner (such as an advertisement within a bill or invoice) and does not require disruption of service.[145]

On December 27, 2018, a “nationwide outage” caused 9-1-1 service to be disrupted across the country. The Federal Communications Commission says it will investigate.[146][147] In some areas the outage lasted nearly twelve hours and was the third shutdown of the year following outages in April and November 2018. ATM and point of sale credit card machines were also widely affected.[148]

History

CenturyLink Technology Center of Excellence in Monroe, LA

The earliest predecessor of CenturyLink was the Oak Ridge Telephone Company in Oak Ridge, Louisiana, which was owned by F. E. Hogan, Sr. In 1930, Hogan sold the company, with 75 paid subscribers, to William Clarke and Marie Williams, for $500. They moved the switchboard to the Williams family front parlor. In 1946, the Williams' son, Clarke McRae Williams, received ownership of the family's telephone company as a wedding gift.[1] In 1947, Clarke Williams learned the telephone company in Marion, Louisiana was for sale. With a loan from business associate Joe Sydney Carter, Clarke purchased the Marion Telephone Company and eventually made it his base of operation as he grew his company through more acquisitions. CenturyLink still maintains offices in the former headquarters building.[10] The company remained as a family-operated business until it became incorporated in 1968.[1][11]

1967-1999

By 1967, Oak Ridge Telephone Company served three states with 10,000 access lines. That year, the company was incorporated as Central Telephone and Electronics. Clarke M. Williams served as president and chairman of the board.[1] Between 1972 and 1975, Clarke gradually moved his headquarters from Marion to Monroe, Louisiana, to access the larger employee base and to be near the airport.

File:Century Telephone.gif

Century Telephone logo

In 1971, the company was renamed as Century Telephone Enterprises, Inc.[1][11] In 1972, Century Telephone acquired the La Crosse Telephone Corporation, of Wisconsin.[1]

On October 24, 1978, Century Telephone moved to the New York Stock Exchange for the first time and began to trade under the ticker symbol CTL.[1]

Century Telephone performed well during the long bear market of the 1970s, as its stock rose over fourfold. The company provided telephone service in parts of 14 states by that time.[12]

In 1981, Century Telephone acquired War Telephone in West Virginia.[13]

In 1982, Century Telephone's earnings peaked at $14 million, then declined in 1983 following the early 1980s recession, and finally began to recover in 1984. However, the 1983 decline led to a loss of half the value of the company's stock in 1984.[12]

In 1985, both earnings and the stock price had recovered to new record highs. But by then, the company had accumulated $206 million in long-term debt.[12] Century Telephone sold the operations of War Telephone and two other companies to Colonial Telephone for $4.66 million.[14]

In 1987, the stock price nearly doubled from its low that year, and from its old 1982 record high, before falling back by a third in the 1987 stock market crash. Earnings had steadily grown each year from their 1983 low, and by 1987 reached nearly US$20 million.[12]

In 1989, Century Telephone Enterprises acquired Universal Telephone, Inc. for US$90 million in cash.[1] During the late 1980s the company began a long trend in which it performed extremely well. The stock split three-for-two twice in this period, as earnings steadily grew, through the 1990-1991 recession, and by year-end 1991, they reached nearly US$40 million, double from what they had been in 1987.[12]

In 1992, Century Telephone acquired Central Telephone Company of Ohio, a Centel subsidiary, for $135 million. The acquisition served more than 65,000 access lines, and added 20% to Century's access line total. Also that year Glen F. Post III became Chief Executive Officer and, named Vice Chairman of the Board of Century Telephone.[1]

In 1993, Century Telephone revenues were over $425 million, up from about $350 million in 1992. 1993 earnings were nearly $80 million, up from about $70 million in 1992, excluding a nearly $16 million charge in 1992 due to the cumulative effect from an accounting change that year.[12][15] Also in 1993 the company split its stock three-for-two yet again. However, by that time, the company had accumulated nearly $520 million in long-term debt.[12]

By 1995, Century Telephone Enterprises had been added to the S&P MidCap 400 index. Earnings had continued their steady growth trend through the 1994 economic soft landing, and by 1995 they reached over US$115 million. But the long-term debt continued to grow as well, reaching US$623 million that year.[12]

In 1997, Century Telephone acquired Delta Security Alarm Co., Inc. of Monroe, Louisiana, and its largest acquisition up until that time, Pacific Telecom, doubling its size with 660,000 additional telephone access lines in 12 states.[1] Pacific Telecom, Inc., would continue existence and was renamed CenturyTel of the Northwest, Inc.

In 1998, Century Telephone split its stock three-for-two once again. The company acquired another Monroe, Louisiana security company, Century Protection Systems, and also acquired 89,000 access lines and 19 exchanges in 21 northern Wisconsin communities from Ameritech. The affected customers had formerly been served by Wisconsin Bell. Ameritech's directory publishing operations serving those customers were also acquired.[16]

In 1999, the company was renamed as CenturyTel, Inc.[17] It split its stock three-for-two once more, and was added to the Standard & Poor's 500 Index that year.[1]

2000-Present

Former CenturyTel logo used by the company prior to becoming CenturyLink

CenturyTel office, Ann Arbor, Michigan

In 2000, CenturyTel acquired 230,500 GTE lines in Arkansas, and also bought 127,000 GTE lines in Missouri in partnership with Spectra Communications.[18][19] In Wisconsin, it acquired 133,000 additional lines, and 70,500 access lines for US$195 million from Verizon. That year CenturyTel also bought 62,650 lines for US$170 million in partnership with Telephone USA of Wisconsin, LLC.[20]

In 2001, CenturyTel acquired CSW Net, Inc. of Russellville, Arkansas, and fended off a hostile take-over attempt by ALLTEL, Inc.[21][22]

In 2002, the son of the company's original founder and Chairman of the Board Clarke M. Williams died. He was succeeded by then Vice Chairman Glen F.

Post III. The company sold its wireless business to ALLTEL, to become a pure-play rural local exchange carrier. Also that year CenturyTel acquired 300,000 Verizon access lines in Alabama, and 354,000 Verizon access lines in Missouri, bringing its total operations to 22 states with 2.5 million access lines.[23]

In 2003, CenturyTel acquired half ownership of SkyComm International, Inc. in Houston, Texas, in March, to form a satellite teleport for its global Network Access Point (NAP) system. In June, CenturyTel also acquired the fiber network of Digital Teleport, Inc., a 5,700-mile (9,200 km) route running from Illinois to Texas, and adjoining states.[24] CenturyTel renamed the network company LightCore.[25] Closing out the year, in December CenturyTel acquired the Midwest Fiber Optic Network (MFON) from Level 3 Communications, Inc. in December, a stand-alone system in the same core central states as LightCore.[1]

In August 2004, it partnered with EchoStar Communications Corporation for DISH Network multi-channel digital TV.[26] In September, CenturyTel began a relationship with Cingular Wireless.[27]

In 2005, CenturyTel began a wireless voice and data service, and bought a number of fiber networks in the central United States, from KMC Telecom Holdings, Inc.[28]

In 2006, CenturyTel sold its Arizona assets to Hopi Telecommunications, Inc., bringing total operations to 23 states.[1]

In May 2007, CenturyTel acquired Madison River Communications, based out of Mebane, NC and parent company to four LECs (AL, GA, IL, and NC) as well as CLEC operations in IL, LA, and NC. The LECs included Mebtel Communications, a telephone company serving Alamance County, North Carolina;[29][30] GulfTel Communications, based out of Foley, AL and serving Baldwin and surrounding counties;[31][32] Coastal Communications, based out of Hinesville, GA; and Gallatin River Communications, serving the Dixon, Galesburg, and Pekin areas of IL.

In late 2007, the Customer Respect Group, an international research and consulting firm that focuses on how corporations treat their online customers, ranked CenturyTel the best among six leading communications providers.

On June 2, 2009, a press release announced that the combined CenturyTel/Embarq entity would be called CenturyLink.[33] Denver-based Monigle Associates was retained to formulate the new brand strategy. The acquisition was completed on July 1, 2009.[34]

On October 19, 2009, CenturyTel and Embarq brandings were retired, and all business was officially conducted under the CenturyLink banner, continuing to trade on the NYSE under the CenturyTel stock ticker CTL. The new corporate name, CenturyLink, Inc., did not become official until May 2010.[35][36]

Services offered

CenturyLink offices in Salt Lake City, Utah

CenturyLink offers voice and data communications, as well as television and home security services.[37] CenturyLink's local and long distance voice communications is POTS. CenturyLink's data communication is through DSL, Metro Ethernet, MPLS, ATM, and Frame Relay over fiber optics, copper DS-3 and T-1 lines. The company also offers bundling with Verizon Wireless.[38]

Television

Main article: Prism TV

CenturyLink offers a fiber-optic based IPTV service named Prism TV in select markets.[40] In areas where Prism TV is not available, CenturyLink partners with DirecTV.

Fiber

CenturyLink Fiber is a fiber to the premises service in the United States, providing broadband Internet and Prism TV to a small and very slowly growing number of locations. The service was first introduced to Omaha, Nebraska,[41] and next rolled out to Las Vegas, Nevada,[42] with plans for expansion to several other markets.[43] Unlike the company's existing high speed Internet deployments, which utilize fiber-to the node/neighborhood to increase the speed of ADSL2+ speeds up to 20/2 Mbit/s, Vectored VDSL2+ speeds up to 140/10Mbit/s, in these markets CenturyLink now installs their fiber optic cable all the way to the home or business with speeds up to 1,000 Mbit/s download and 1,000 Mbit/s upload[44] using Calix Optical Network Terminals.[45] On Feb. 2, 2014, CenturyLink announced the availability of Gigabit fiber service to multi-tenant businesses in Salt Lake City and surrounding communities.[46] On Aug. 5, 2014, CenturyLink announced the expansion of its gigabit fiber service to 16 additional markets.[47] On Sep, 15, 2015, CenturyLink announced the expansion of its gigabit fiber service to residential and business customers in six additional states, increasing the company's service coverage to select areas of 17 states.[48]

Data centers

On May 2, 2017 CenturyLink, Inc. completed the previously announced sale of its data centers and colocation business to funds advised by BC Partners, in a consortium including Medina Capital Advisors and Longview Asset Management. The deal was worth approximately $1.86 billion with CenturyLink retaining an approximately 10% equity stake in the consortium's newly formed global secure infrastructure company, Cyxtera Technologies.

Organizational structure

The combined company's 37-state service area is organized into five regions and led by region presidents.[54] The region presidents are responsible for revenue, customer retention, customer satisfaction, and service delivery throughout their local markets.[55] The regions, region headquarters locations, and states within each region are:

Acquisitions

File:CenturyLinkCombinedCoverageMap.gif

CenturyLink's combined coverage following Embarqacquisition. Dark fiber and lit fiber assets are shown

On October 27, 2008, Embarq announced that it would be acquired by CenturyTel, Inc. in an all-stock transaction valued at about $6 billion.[56][36] CenturyTel's CEO Glen Post would remain CEO of the merged company following the acquisition,[57] and remained CEO as of 2018.[58] Embarq was the former landline business of Sprint and served cities in 18 states, including Nevada, Florida, North Carolina and Ohio.[59] The deal made CenturyTel the third-largest landline phone provider in Pennsylvania behind Verizon (through both Verizon Pennsylvania and Verizon North) and Comcast.

Network map of combined Qwestand CenturyLink assets

On April 22, 2010, CenturyLink (at this point still legally known as CenturyTel, Inc.) announced it would acquire Qwest in a stock-for-stock transaction.[60] Under the agreement, CenturyLink would swap 0.1664 of its shares for each share of Qwest; as a result, CenturyLink shareholders prior to the merger wound up with 50.5% share of ownership in the combined company, while former Qwest shareholders gained the remaining 49.5%.[61] The valuation of CenturyLink's purchase was $12 billion.[56] The merger was completed on April 1, 2011.[62][63]

The addition of Qwest allowed CenturyLink to become the third largest telecommunications company in the United States, and the largest landline phone provider in the state of Colorado.[58] The new company has 17 million access lines, 5 million broadband customers, and 1.4 million video subscribers across 37 states.[64] The merger also made CenturyLink owner of one of the so-called Baby Bells: Qwest included what was once US West, the Baby Bell for much of the western United States.

On July 15, 2011,[59] CenturyLink acquired Savvis, Inc., a global provider of cloud infrastructure and hosted IT services for $2 billion, which represented all

outstanding shares of Savvis common stock at $40 per share.[56][65] This acquisition allowed CenturyLink to provide expanded managed hosting and cloud services.[66]

On December 4, 2012,[67] CenturyLink launched an integrated suite of cloud services called savvisdirect.[68] Savvisdirect was an expansion of CenturyLink's portfolio of Savvis cloud services and includes cloud application hosting,[69] cloud servers,[70] cloud storage,[71] and private cloud[72] for small businesses, IT administrators and developers. CenturyLink later shuttered the savvisdirect subsidiary, consolidating their cloud service offerings internally.

On October 16, 2012 Savvis acquired ITO Business Division of Ciber thereby adding managed services to the portfolio.[73]

On June 14, 2013, CenturyLink announced the acquisition of AppFog, a Portland-based Platform as a Service used by over 100,000 developers to automate the deployment of software on public clouds such as Amazon Web Services and OpenStack.[74]

On November 19, 2013, CenturyLink announced the acquisition of Tier 3, a Seattle-based infrastructure as a service (IaaS), platform, and advanced cloud management company[75] based on Cloud Foundry.[76]

On December 8, 2014, CenturyLink announced the acquisition of DataGardens, Inc., a Disaster Recovery as-a-Service (DRaaS) provider based in Edmondton, Alberta, Canada.[77]

On December 11, 2014, CenturyLink announced the acquisition of Cognilytics, a predictive analytics and big data service provider.[78]

On March 30, 2016, CenturyLink announced the acquisition of netAura, a security services company that focuses on cybersecurity, security information and event management (SIEM), analytics and vulnerability management.[79]

On January 9, 2017, CenturyLink announced the acquisition of Edison, New Jersey-based SEAL Consulting, a leading SAP services provider. This expanded CenturyLink's existing integrated SAP capabilities of hosting and managed services to include integration and software implementation. [80]

On October 31, 2016, CenturyLink announced its intent to acquire Level 3 Communications in a deal valued at around $25 billion.[81]. After securing the necessary regulatory approvals, CenturyLink closed the transaction on November 1, 2017.[82]

Criticism and controversy

The Federal Communications Commission ordered CenturyLink to pay a record $16 million for failing to alert authorities of a preventable programming error that left nearly 11 million people in seven states without access to emergency services for six hours in 2014.[84][85]

In December 2018, CenturyLink attracted criticism after employing DNS hijacking to display an advertisement for its security and parental control software to residential subscribers in Utah, with service disrupted to users until they read and acknowledge the advertising. CenturyLink stated that the message was presented to comply with a recently-enacted Utah state law, requiring ISPs to inform users "of the ability to block material harmful to minors". Bill sponsor and Utah State Senate member Todd Weiler stated that the law did not require that service be disrupted until the notice is acknowledged; the law only requires that this notice be delivered in a conspicuous manner, and suggested manners such as inclusion in a monthly bill.[86]

On December 27th, 2018, a "nationwide outage" caused 9-1-1 service to be disrupted across the country. The Federal Communications Commission says it will investigate.[87][88] In some areas the outage lasted nearly twelve hours and was the third shutdown of the year following outages in April and November 2018. ATM and point of sale credit card machines were also widely affected.[89]

Life and career[edit]

Vinton Cerf in Vilnius, September 2010

Cerf was born in New Haven, Connecticut, the son of Muriel (née Gray) and Vinton Thurston Cerf.[13][14] Cerf attended Van Nuys High School with Jon Postel and Steve Crocker. While in high school, Cerf worked at Rocketdyne on the Apollo program and helped write statistical analysis software for the non-destructive tests of the F-1 engines.[15]

Cerf received a Bachelor of Science degree in mathematics from Stanford University.[16] After college, Cerf worked at IBM as a systems engineer supporting QUIKTRAN for two years.[2]

Cerf and his wife Sigrid both have hearing deficiencies; they met at a hearing aid agent's practice in the 1960s,[17] which led him to becoming an advocate for accessibility.

He left IBM to attend graduate school at UCLA where he earned his M.S. degree in 1970 and his PhD in 1972.[6][18] Cerf studied under Professor Gerald Estrin and worked in Professor Leonard Kleinrock's data packet networking group that connected the first two nodes of the ARPANet,[19] the first node[19] on the Internet, and "contributed to a host-to-host protocol" for the ARPANet.[20]

While at UCLA, Cerf met Bob Kahn, who was working on the ARPANet system architecture.[20] Cerf wrote the first TCP protocol with Yogen Dalal and Carl Sunshine, called *Specification of Internet Transmission Control Program* (RFC 675), published in December 1974.[21]

Cerf worked as assistant professor at Stanford University from 1972 to 1976 where he conducted research on packet network interconnection protocols and co-designed the DoD TCP/IP protocol suite with Kahn.[20]

Cerf playing *Spacewar!* on the Computer History Museum's PDP-1, ICANN meeting, 2007

Cerf worked at the United States Defense Advanced Research Projects Agency (DARPA) from 1973 to 1982 and funded various groups to develop TCP/IP, packet radio (PRNET), packet satellite (SATNET) and packet security technology.[22] These efforts were rooted in the needs of the military.[23][24][25] In the late 1980s, Cerf moved to MCI where he helped develop the first commercial email system (MCI Mail) to be connected to the Internet.[26]

Cerf is active in a number of global humanitarian organizations.[*citation needed*][27] Cerf is also known for his sartorial style, typically appearing in a three-piece suit—a rarity in an industry known for its casual dress norms.[28][29]

As vice president of MCI Digital Information Services from 1982 to 1986, Cerf led the engineering of MCI Mail, the first commercial email service to be connected to the Internet. In 1986, he joined Bob Kahn at the Corporation for National Research Initiatives as its vice president, working with Kahn on Digital Libraries, Knowledge Robots, and gigabit speed networks. Since 1988 Cerf lobbied for the privatization of the internet.[30] In 1992, he and Kahn, among others, founded the Internet Society (ISOC) to provide leadership in education, policy and standards related to the Internet. Cerf served as the first president of ISOC. Cerf rejoined MCI during 1994 and served as Senior Vice President of Technology Strategy. In this role, he helped to guide corporate strategy development from a technical perspective. Previously, he served as MCI's senior vice president of Architecture and Technology, leading a team of architects and engineers to design advanced networking frameworks, including Internet-based solutions for delivering a combination of data, information, voice and video services for business and consumer use.

During 1997, Cerf joined the Board of Trustees of Gallaudet University, a university for the education of the deaf and hard-of-hearing.[31] Cerf himself is hard of hearing.[32] He has also served on the university's Board of Associates.[33]

Cerf, as leader of MCI's internet business, was criticized due to MCI's role in providing the IP addresses used by Send-Safe.com, a vendor of spamware that uses a botnet in order to send spam. MCI refused to terminate the spamware vendor.[34][35] At the time, Spamhaus also listed MCI as the ISP with the most Spamhaus Block List listings.[36]

Cerf has worked for Google as a vice president and Chief Internet Evangelist since October 2005.[5] In this function he has become well known for his predictions on

how technology will affect future society, encompassing such areas as artificial intelligence, environmentalism, the advent of IPv6 and the transformation of the television industry and its delivery model.[37]

Since 2010, Cerf has served as a Commissioner for the Broadband Commission for Digital Development, a UN body which aims to make broadband internet technologies more widely available.

Cerf helped fund and establish ICANN, the Internet Corporation for Assigned Names and Numbers. He joined the board in 1999, and served until November 2007.[38] He was chairman from November 2000 to his departure from the Board.

Cerf was a member of Bulgarian President Georgi Parvanov's IT Advisory Council (from March 2002 – January 2012). He is also a member of the Advisory Board of Eurasia Group, the political risk consultancy.[39]

Cerf is also working on the Interplanetary Internet, together with NASA's Jet Propulsion Laboratory and other NASA laboratories. It will be a new standard to communicate from planet to planet, using radio/laser communications that are tolerant of signal degradations including variable delay and disruption caused, for example, by celestial motion.[40]

On February 7, 2006, Cerf testified before the U.S. Senate Committee on Commerce, Science, and Transportation's hearing on network neutrality. Speaking as Google's Chief Internet Evangelist, Cerf noted that nearly half of all consumers lacked meaningful choice in broadband providers and expressed concerns that without network neutrality government regulation, broadband providers would be able to use their dominance to limit options for consumers and charge companies like Google for their use of bandwidth.[41]

Cerf at 2007 Los Angeles ICANN meeting

Cerf currently serves on the board of advisors of Scientists and Engineers for America, an organization focused on promoting sound science in American government.[42] He also serves on the advisory council of CRDF Global (Civilian Research and Development Foundation) and was on the International Multilateral Partnership Against Cyber Threats (IMPACT) International Advisory Board.[43]

Cerf was elected as the president of the Association for Computing Machinery in May 2012[44] and joined the Council on CyberSecurity's Board of Advisors in August 2013.[45]

From 2011 to 2016, Cerf was chairman of the board of trustees of ARIN, the Regional Internet Registry (RIR) of IP addresses for United States, Canada, and part of the Caribbean.[46] Until Fall 2015, Cerf chaired the board of directors of StopBadware, a non-profit anti-malware organization that started as a project at Harvard University's Berkman Center for Internet & Society.[47][48] Cerf is on the board of advisors to The Liquid Information Company Ltd of the UK, which works to make the web more usefully interactive and which has produced the Mac OS X utility called 'Liquid'.[49] Vint Cerf is a member of the CuriosityStream Advisory Board.[50]

During 2008, Cerf chaired the Internationalized domain name (IDNAbis) working group of the IETF.[51] In 2008 Cerf was a major contender to be designated the first U.S. Chief Technology Officer by President Barack Obama.[52] Cerf is the co-chair of Campus Party Silicon Valley, the US edition of one of the largest technology festivals in the world, along with Al Gore and Tim Berners-Lee.[53] From 2009 to 2011, Cerf was an elected member of the Governing Board of the Smart Grid Interoperability Panel (SGIP). SGIP is a public-private consortium established by NIST in 2009 and provides a forum for businesses and other stakeholder groups to participate in coordinating and accelerating development of standards for the evolving Smart Grid.[54] Cerf was elected to a two-year term as President of the Association for Computing Machinery (ACM) beginning July 1, 2012.[55] In 2015 Cerf co-founded (with Mei Lin Fung), and is currently chairman of, People-Centered Internet (PCI).[56] On January 16, 2013, U.S. President Barack Obama announced his intent to appoint Cerf to the National Science Board.[57] Cerf served until May 2018 when his six-year term expired.

Cerf is also among the 15 members of governing council of International Institute of Information Technology, Hyderabad.[58]

In June 2016, his work with NASA led to Delay-tolerant networking being installed on the International Space Station with an aim towards an Interplanetary Internet.[59]

Since at least 2015, Cerf has been raising concerns about the wide-ranging risks of digital obsolescence, the potential of losing much historic information about our time – a digital "dark age" or "black hole" – given the ubiquitous digital storage of text, data, images, music and more. Among the concerns are the long-term storage of, and continued reliable access to, our vast stores of present-day digital data and the associated programs, operating systems, computers and peripherals required to access such.[60][61][62][63]

In March 2020, Cerf confirmed that he had tested positive for COVID-19. He announced the news via a tweet in which he also criticized President Donald Trump for the way he was handling the COVID-19 pandemic in the United States.[64] On April 3, 2020, Cerf announced via Twitter that VA Public Health had certified his wife and himself as no longer contagious with the virus.[65]

Cerf and Bob E. Kahn being awarded the Presidential Medal of Freedom by President George W. Bush

Cerf and Bulgarian President Parvanov being awarded the St. Cyril and Methodius in the Coat of Arms Order

Cerf has received a number of honorary degrees, including doctorates, from the University of the Balearic Islands, ETHZ in Zurich, Switzerland, Capitol College, Gettysburg College, Yale University,[66] George Mason University, Marymount University, Bethany College (Kansas), University of Pisa, University of Rovira and Virgili (Tarragona, Spain), Rensselaer Polytechnic Institute,[67] Luleå University of Technology (Sweden), University of Twente (Netherlands), Beijing University of Posts and Telecommunications, Tsinghua University (Beijing), Brooklyn Polytechnic, UPCT (University of Cartagena, Spain), Zaragoza University (Spain), University of Reading (United Kingdom), Royal Roads University (Canada), MGIMO (Moscow State University of International Relations), Buenos Aires Institute of Technology (Argentina), Polytechnic University of Madrid, Keio University (Japan), University of South Australia (Australia), University of St Andrews (Scotland), University of Pittsburgh and[68] Gallaudet University (United States). Other awards include:

- Edward A. Dickson Alumnus of the Year Award from UCLA[69]
- Prince of Asturias award for science and technology[70]
- Life Member IEEE[71]
- Fellow of the Association for Computing Machinery, 1994[72][73]
- Yuri Rubinsky Memorial Award, 1996[74][75]
- SIGCOMM Award for "contributions to the Internet [spanning] more than 25 years, from development of the fundamental TCP/IP protocols".[76]
- Certificate of Merit from The Franklin Institute, in 1996.

- In December 1997 he, along with his partner Robert E. Kahn, was presented with the National Medal of Technology by President Bill Clinton, "for creating and sustaining development of Internet Protocols and continuing to provide leadership in the emerging industry of internetworking."[77][78]
- In 2000, he received the honorary doctorate degree from URV, Spain.[79]
- He received the Living Legend Medal from the Library of Congress in April 2000
- In 2000, he was made a Fellow of the Computer History Museum "for his contributions to computer architecture, operating systems, and software engineering."[80]
- Cerf was selected as a Fellow of the Association for Women in Science (AWIS) in 2000.
- Cerf was awarded the Award of Technology from the Telluride Tech Festival in 2002, also known as the Tesla Festival since the world's first AC hydro-power power plant was built in Telluride in 1891 by L.L. Nunn who purchased the generator and plans from George Westinghouse and Tesla.
- Cerf and Kahn were the winners of the Turing Award for 2004,[11] for their "pioneering work on internetworking, including .. the Internet's basic communications protocols .. and for inspired leadership in networking."[81]
- In November 2005, Vinton Cerf and Kahn were awarded the Presidential Medal of Freedom by President George W. Bush for their contributions to the creation of the Internet.[12]
- He and Robert Kahn were inducted into the National Inventors Hall of Fame in May 2006
- Vinton Cerf was awarded the St. Cyril and Methodius in the Coat of Arms Order in July 2006[82]
- Vinton Cerf and Robert Kahn were each inducted as an Honorary Fellow of the Society for Technical Communication (STC) in May 2006
- He and Robert Kahn were awarded the Japan Prize in January 2008.[83]
- Cerf was inducted into the Worshipful Company of Information Technologists and given the Freedom of the City of London in April 2008.
- Cerf was awarded an honorary membership in the Yale Political Union after keynoting a lively debate on the subject "Resolved: Online Communities are Real Communities." The motion passed.[84]
- In celebration of the five year-anniversary of YouTube he was selected as a guest curator by the site, and chose the six videos on YouTube he found most memorable.[85]
- IEEE-HKN Eta Kappa Nu Eminent Member, 2010[86]
- In May 2011, he was awarded an HPI Fellowship as "...a tribute to his work for a new medium which influenced the everyday life of our society like no other one."[87]
- In September 2011 he was made a distinguished fellow of British Computer Society, in recognition of his outstanding contribution and service to the advancement of computing.[88]
- In 2012 he was inducted as a Pioneer into the Internet Hall of Fame[89]
- In 2013, Cerf was one of five Internet and Web pioneers awarded the inaugural Queen Elizabeth Prize for Engineering.[90]
- In 2013, Cerf presented the Bernard Price Memorial Lecture[91]
- In 2014, Cerf was awarded the Order of the Cross of Terra Mariana, 1st class for his role in invention of TCP/IP by president of Estonia Toomas Hendrik Ilves[92]
- In 2014, Cerf was awarded Officer of the French Légion d'honneur [93]
- In 2015, Cerf received an honorary doctorate from the University of Reading, UK.[94]
- Cerf was elected a Foreign Member of The UK Royal Society in 2016[1]
- In 2018, Cerf was named a recipient of the Benjamin Franklin Medal[95]
- In 2018, Vinton Cerf was awarded Catalonia's International Award[96]

CERFnet

Wikipedia CERFnet

Saved Wikipedia (Jan 14 2021) for CERFnet

[HK004S][GDrive]

The **California Education and Research Federation Network** (CERFnet) is a mid-level network service provider based in California. It was originally proposed by Susan Estrada of the San Diego Supercomputer Center (SDSC). CERFnet was one of the [NSFNET] regional networks and a co-founder of the Commercial Internet eXchange (CIX).[1] The CERFnet network was founded in January 1988 by Susan Estrada, received partial funding of $2.8 million by the National Science Foundation a year later, and was fully operational by November 1989, linking together 38 California research centers. The network was operated by the SDSC and General Atomics.[2]

CERFnet History (June 1992, from nic.cerf.net)

1992-06-29-nic-cerf-net-history.txt

http://www1.chapman.edu/gopher-data/archives/Internet%20Information/cerfnet-history.txt

In June, 1988, a proposal was submitted by the San Diego Supercomputer Center and General Atomics to the National Science Foundation (NSF) to establish the California Education and Research Federation Network (CERFnet). Thirty-four of the leading research and education centers in California participated in the proposal effort. In March, 1989, $2.8 million was awarded by the NSF to initiate CERFnet. The institutions contributed additional funds in membership fees, support personnel (such as training, consultation, and documentation), and maintenance of equipment needed to connect and support their CERFnet link.

Today, CERFnet links over 300 research and education centers with data transfer rates of up to 45 Megabits-per-second. CERFnet provides enhanced communication among researchers, educators and private industry, and high-speed access to the resources available through the National Science Foundation Network (NSFNET) and the Internet, such as supercomputer centers, online library catalogs, and specialized databases.

The Research Need

Before CERFnet, some of the institutions had medium-speed access to the [NSFNET] backbone but a substantial increase in bandwidth and connectivity was needed to encourage usage by making access easier, faster, and cost-efficient.

The need for CERFnet was two-fold. The availability of high-speed networking and supercomputer power greatly expands computational possibilities. This stimulates a wider range of scientific explorations and makes projects more feasible. Complex projects frequently involve the sharing of databases, software, and results by researchers in different institutions and multiple disciplines. Project feasibility is enhanced by the integrated communications environment offered by the Internet by achieving better collaboration and interaction with distant colleagues and resources.

Many of the institutions were already experienced in using NSF and other supercomputer centers, such as the San Diego Supercomputer Center, the National Center for Atmospheric Research, the Lawrence Livermore National Laboratory, and the National Magnetic Fusion Energy Center. Today, CERFnet allows convenient access to these state-of-the-art facilities. CERFnet also provides capabilities through the use of TCP/IP, which include remote logins, file

transfers, and telnet sessions.

CERFnet Phase I

CERFnet was built on existing data communication links--some have been upgraded to higher bandwidths. New links were installed between March and November 1989 to expand the network to all of the original research and education centers.

CERFnet's high-speed backbone nodes were installed between May and June 1989 at the University of California, Los Angeles (UCLA), University of California, Irvine (UCI), the San Diego Supercomputer Center (SDSC), and the California Institute of Technology (Caltech). The backbone was expanded to the University of California Office of the President in Oakland in November, 1989, and to San Jose in December, 1990.

CERFnet Phase II

In March, 1990, CERFnet submitted a proposal to the NSF for Phase II. Phase II proposed to establish new Internet connections for three four-year colleges and two community colleges. CERFnet also proposed to establish gateways to fifteen FrEdMail (Free Educational Mail) Network sites.

The FrEdMail Network is a grass-roots data- communications network that allows teachers and students at K-12 institutions around the country to exchange teaching materials, student assignments, and information on workshops, job opportunities, and national legislation affecting education.

The institutions proposed in CERFnet Phase II were brought online between September,1990 and March,1991, at a cost of $226,000 over two years.

Further Expansion

Since March, 1989, the network has grown to include over 300 research and education centers. Several classes of memberships were introduced since 1989. All of these memberships provide access to the Internet via a dedicated leased line service or by a dial up connection. The dedicated lease line services that CERFnet has provided are CERF 1544 (1.544 megabits-per-second); CERF 56 (56 kilobits-per-second); CERF 14.4 (14.4 kilobits-per-second); and CERF 9.6 (9.6 kilobits-per-second). The dial up connections include DIAL n' CERF, DIAL n' CERF AYC, and DIAL n' CERF Plus which all provide dialup SLIP access up to 19.2 kilobits-per-second. An additional dial up service that has recently been introduced is DIAL n' CERF USA, which uses an 800 number for toll-free connections anywhere in the United States. All of these memberships are supported by subscription fees.

In 1991, CERFnet also established the first Commercial Internet Exchange (CIX) in cooperation with PSInet amd Alternet. The CIX has expanded to include several additional domestic and international networks. It permits the exchange of commercial traffic between these three networks.

Adopt A School is a program that originated in September 1991 and it allows CERFnet users to connect a local K-12 school to DIAL n' CERF. The CERFnet user helps the school use the connection and the available information on the Internet. The school or CERFnet user provides a terminal/PC and modem. Many staff members have already adopted their schools their children attend or that are in their neighborhoods. Currently, there are about 19 schools involved in the program.

CERFnet also estabilised their first T1 connection near the end of 1991. This 45 megabits-per-second connection extends between two of CERFnet's backbone sites, UCI and California Institude of Technology. The success of thisconnection will pave the way for the upgrade of all CERFnet's backbone circuits.

Three international links were also completed by the end of 1991. The Federal University of Rio de Janeiro (UFRJ) came on-line in December 1991. The connection between CERFnet and UFRJ is intended to provide, among other things, Internet access to a regional network located within the state of Rio de Janeiro. Initially, nine institutions will be connected to this local network: Brazilian Center of Investigating Sciences (CBPF), Fundacao Oswaldo Cruz (FIOCRUZ), Institute of Mathematics Prue and Applied (IMPA), Polytechnic Institute of Rio de Janeiro (IPRJ), National Laboratory of Computer Science (LNCC), Pontifical Catholic University of Rio de Janeiro (PUC-Rio), State University of Rio de Janeiro (UERJ), Federal University Fluminense (UFF), and the Federal University of Rio de Janeiro (UFRJ). Eventually the network will expand to include research institutions located in the state of Sao Paulo.

Three of these institutions (CBFF, IMPA, and LNCC) are laboratories of the National Council of Scientific Development and Technology, which is the equivalent of the National Science Foundation. Two are federally funded universities (UFF and UFRJ) and FIOCRUZ is the laboratory of the Federal Health Ministry.

The CICESE Institute located in Ensenada, Mexico was brought on-line in November 1991. The institute will have a 64 kbps satellite link to the SDSC via the Mexican satellite, Morelles II.

The System Engineering Research Institute (SERI), Seoul Korea was brought on-line in March 1991. SERI is similar to the National Foundation sponsored supercomputer centers. SERI performs a large number of research and development products for both domestic and foreign clients through the application of its high level resources, such as supercomputers. The link between SERI and CERFnet will provide Internet access to the Korean National Research Network (KREONet).

8% Home Investment.

The Chidsey New York Free Delivery

Whose specialty is delivering for the leading New York, Newark and Elizabeth Department Stores in Bergen, Hudson, Middlesex, Morris, Passaic and Union Counties is being reorganized with a capital of $200,000 as the

Chidsey Express Delivery Co.

And offers to investors $85,000 15 year Gold Bonds with interest at 5 per cent. Payable semi-annually.

The Bonds are secured by a First Mortgage given to the

UNION COUNTY TRUST CO., Trustee,

covering its entire plant, equipment and property. Bonds are offered at par and will bear interest from August 1st. Each $1,000 in bonds carries with it as a bonus five shares of capital stock, par value $100 each full paid and non-assessable.

Experts familiar with the financial results attained by conservatively managed Express Companies, and the Chidsey business, estimated that with the economies conserved, and by the additional facilities and business to be secured by this reorganization, annual net earnings will be ample to provide a sinking fund for the redemption of bonds, the interest thereon, and an annual dividend of at least 6 per cent. on the capital stock, making total income of $8.00 on each $100 in vested.

Bond Subscriptions are being received from Financial Institutions, and others fully posted as to value of the security and earning capacity of the company.

THE EXPERIENCE OF ITS MANAGERS HAS FULLY DEMONSTRATED THE MANY BENEFITS ACCRUING TO SUCH A CONCERN WHEN ITS STOCKHOLDERS ARE ALSO ITS PATRONS, THEREFORE IT PRESENTS THIS OPPORTUNITY TO SHOPPERS WHO ARE PATRONS OF THESE STORES TO CONSIDER THIS INVESTMENT.

Bonds are $500 each. Subscriptions should be sent to the Union Trust Company of Elizabeth, N. J. Bonds will be allotted in the order of subscriptions, which must be accompanied by cash or certified check for 10 per cent. of the amount subscribed, for which Trust Co.'s receipt will be given pending issue, and the full amount returned to those whose subscriptions are received too late to secure bonds.

Subscription books will be closed July 23rd inst.

Subscription Blanks can be obtained upon application to the Chidsey's Free Delivery, or Union County Trust Company, or Board of Trade, Elizabeth, N. J., or Hackensack National Bank, Hackensack, N. J.

Flower and Produce Show At Clinton Is Big Success

Clinton—Annual Flower and Produce Show held in the Bethlehem Presbyterian Church, Grandin, proved a big success. The show was given Wednesday and last evening. Dr. C. H. Conors of the State Agricultural College and Dwight M. Babbitt, county farm agent, awarded the ribbons.

The awards for flowers are as follows: Class 1—Best vase of zinnias: Alice Crouse, Milford, Howard Frace Jr., Pittstown; Mrs. Hemke, Lebanon.

Class 2—Best in small zinnias: Kathryn Barber, Clinton; Lucy Yates, Annandale; Mrs. Hemke.

Class 3—Best of African marigolds: Mrs. Hemke; Cora McCrea, Milford; Mrs. Gladys Barlow, Hampton.

Class 4—Best Guinea gold marigolds: Cora McCrea; Marian Huff, Milford; A. B. Agans, Pittstown.

Class 5—Best French marigolds: Cora McCrea, Mrs. Edward Sheets, Annandale; Miss Helen Haver, Clinton.

Class 6—Best cosmos: Lucy Yates; Kenneth Rice, Annandale; Marian Huff.

Class 7—Best asters: Cora McCrea; Austin Roberts, Clinton; Mary Jane Mitchell, Clinton. Class 8—Best petunias: Mrs. M. E. McPhail, Clinton; Kathryn Barber; Mrs. Thackaberry, Clinton. Class 9—Best basket of annuals: Mrs. Fred MacPherson, Clinton, A. B. Agans, Mrs. Mary Rice. Class 10—Best basket variety perennials: Mrs. Alice Reed, Pittstown; Kathryn Barber, Mrs. Joseph McClary, Annandale.

Roses—Class 11—Best single: Edward Sheets; Mrs. Alice Reed. Class 12—Best collection—no entries.

Gladioli, Class 13—Best collection: Miss Caroline Romer, Summit; Marian Huff; George Milligan, Annandale. Class 14—best spike: Miss Romer, George Milligan.

Dahlias, Class 15—largest bloom: Mrs. Reed, George Milligan; Mrs. MacPherson. Class 16—Best collection: Mrs. Reed; Mrs. Sheets; Mrs. Woehrle, Annandale.

Artistic Arrangement, Class 17—Dinner table: Mrs. Reed; Donnell Gilbert, Lebanon; Sadie Vanderbilt, Pittstown. Class 18—In antique container: Miss Jennie Haver; Sadie Vanderbilt; Mrs. Hemke.

Class 19, arrangement for living room: Miss Helen Haver; Mrs. Agans; Mrs. MacPherson. Class 20, winter bouquet: Miss J. Haver, Mrs. Hemke; Pearl Conover, Clinton. Class 21—dish garden: Howard Frace; Sadie Vanderbilt; Miss J. Haver.

Potted plants—Class 22—Best, Mrs. P. G. Schneider, Jutland. Class 23—Best foliage: Mrs. Joseph McClary; Mrs. Charles Young, Jutland; Mrs. Barlow.

Wild flowers for children under 12—Class 24—Best container: Janet Schanze, Annandale; Kathryn Barber. Sweepstake prize: Mrs. Alice Reed, Pittstown.

Farm produce—Potatoes (5) specimens: E. G. Odell; John Aber. Tomatoes (3) specimens: Glen Rice; Mrs. T. Woehrle; John Chidsey. Egg plant—Mrs. E. Dupont; Mrs. Lester Potts; Jack Rinehart. Cabbage—E. G. Odell. Onions (5) specimens: Mrs. McClary; Clayton Barlow; Glen Rice. Beets (5) George Milligan; John Vanderbilt; Mrs. Alex Young. Peppers (3) Mrs. McClary; Mrs. DuPont; Mrs. Potts. Carrots (5) specimens: Glen Rice; Mrs. Potts; Mrs. Adolph Miller. Lima Beans (10) specimens: Mr. Odell; John Aber; John Vanderbilt. Pumpkin: George Milligan; Jack Rinehart; Howard Frace.

Squash — Howard Frace Jr.; George Milligan; A. C. Ridderoth, D.D.

Eggs—One brown dozen: John Aber; Garrett Mitchell. One dozen whites: no entries:

Fruit—Grapes: John Vanderbilt; J. D. Anderson; Caroline Romer. Pears — S. Johnston; Caroline Romer; Glen Rice. Apples—S. Johnston; J. I. Anderson; Mrs. Woehrle.

Grains—Wheat, John Aber; A. B. Cornwell. Oats—Mr. Vanderbilt; G. Mitchell; Mr. Aber. Corn—Garrett Mitchell; Howard Frace; John Mitchell.

Prizes awarded for total entries in produce—First, John Aber; second, John Vanderbilt; third, George Milligan.

Donald Barr Chidsey (born 1902)

Wikipedia Donald Barr Chidsey

INTRO

See 2019-07-findagrave-com-199060978-donald-barr-chidsey-1902-1981.pdf / https://drive.google.com/open?id=143Gwwr0uR-xHcepyLjIab8xjcc9Nko0N

"Donald Barr Chidsey was an American writer, biographer, historian, novelist and writer of adventure fiction.

Donald Barr Chidsey was born in Elizabeth, New Jersey, on May 14, 1902. He worked at the Elizabeth Daily Journal, and traveled widely in his youth.

He wrote more than fifty books. Alden Whitman called him "an old hand at light writing." According to Kirkus Reviews, Chidsey "is known for his popular American histories, and has a nose for a good story."

He lived in Lyme, Connecticut for many years. Along with artist W. Langdon Kihn, he was a Democratic candidate for the Connecticut House of Representatives from the town of Lyme, in the November 2, 1948 election.

He died on March 17, 1981, in Lawrence Memorial Hospital at New London, Connecticut"

See https://www.historicnavalfiction.com/authors-a-z/other-authors/donald-barr-chidsey

Donald Barr Chidsey (1902-1981) was a frequent contributor to the pulp magazines in the 1930s, even as he developed a more socially acceptable career as a historical novelist and biographer. Early on he dabbled in private eye fiction for such magazines as Star Detective, Detective Fiction Weekly, Dime Detective, and Black Mask, where he wrote tough stuff about homicide cops and busybody newshawks. He became best known for adventure stories, swift and flavorful historical fiction, much of it set at sea, where the author had spent some time himself. His biographies included the life stories of such personages as Bonnie Prince Charlie (1720-1788) and Sir Walter Raleigh (1554-1618).

A rugged, handsome fellow from Elizabeth, New Jersey, Chidsey enjoyed a peripatetic, adventurous youth, including several years aboard a series of tramp steamers that took him to every exotic port on the globe. He also did time as a press agent, keeper, actor, bartender, and golf caddy. **In the 1930s he lived in the South Seas, sailing about the islands on his own boat, and for a time he managed a small coconut plantation in Tahiti**. During World War II Chidsey fought alongside the Free French and New Zealand forces as well as serving in the U.S. Army (stationed in North Africa). Chidsey imbued his fiction with his zest for life and adventure.

1910 Census

Glen Allen ... Chidsey

Father - John M. Chidsey (aka "**John Marshall Chidsey (born 1871)** "). His job is listed as " Expressman", and that he "own his own business"

Birth year changes - Here, John M Chidsey - 1871 birth year ...

Mother - Catherine Chidsey - Born in 1872 in England. She says her parents were both born in Scotland, and that she immigrated to the United States in 1889

Two Sons:

- Donald "B" Chidsey (born in 1902)
- Glen Allan Chidsey (born in 1900)

NEWSPAPERMAN WRITES BIOGRAPHY OF 'BONNIE PRINCE'

Donald Barr Chidsey's Book, the Result of Three Years of Research

That handsome, romantic young adventurer Charles Edward Stuart, better known as "Bonnie Prince Charlie," has broken into print again. A scion of the blood royal, all his life he fought to regain the throne of Great Britain — the throne of his ancestors. And he failed.

But he didn't fail to startle the world and set posterity dreaming. He became, at least the King of Adventurers, and though he never ruled England, Scotland or Ireland, he still rules the imaginations of thousands.

The latest to be fascinated by this dashing hero is Donald Chidsey, a young New York and New Jersey newspaper man whose biography of Bonnie Prince Charlie is being published by The John Day company of New York.

Chidsey, from childhood, thrilled at the tales his mother, a Scotchwoman, told him of the Bonnie Prince who frightened three kingdoms half out of their official wits and played hide-and-seek with two armies in the wilderness of the Western Highlands. He read everything he could beg, borrow, purchase or steal, about Charles Edward Stuart. And when he couldn't beg, borrow, purchase or steal any more books, he quit a perfectly good job with the Standard News association, sold all his clothes excepting one suit and one shirt, and departed for England, where he made a walking trip—as long as his money lasted—over most of the territory in England and Scotland traversed by his hero.

Chidsey ended in Paris, broke but filled with ideas. He got a job as a reporter for the Paris Times; and in a little office overlooking the Place des Deaux Ecus, near the Bourse, BONNIE PRINCE CHARLIE was started. It was finished last fall in New York City—the result of almost three years of research work. It was accepted promptly by The John Day company for publication, and already promises to be one of this Fall's popular biographies.

For the Bonnie Prince never fails to fascinate, and not only Englishmen, Scots and Irishmen, with whom his history was most closely associated, but thrill-lovers the world over, have gasped at the tale of his almost incredible adventures.

History, they say, is stranger than fiction. They also say that you can't keep a good man down. Anyway, Bonnie Prince Charlie has been called back from the Eighteenth Century to do his tricks all over again and to give book lovers of today another opportunity to sigh for the good old days when men drank with both hands and women in powdered wigs precipitated fatal duels, when spies wrote their messages in sympathetic ink and gentlemen in knee breeches bowed low before pompous kings, and when Romance, a sword at its side, a laugh on its lips, strode gaily through the land.

Donald Barr Chidsey briefly was married to Shirley Chidsey (born Elinor Shirley Stewart) 1935 to 1940

2017-thedailybeast-com-the-female-spy-who-kept-uranium-from-nazis.pdf / https://drive.google.com/open?id=144dgNiAMIEpO9C_PBQLlUSrrZHzVES_N

*[**Shirley Armitage Chidsey Bridgwater (born 1907)**] had a huge appetite for travel and adventure. She lived for three years in Haiti, three months in Hawaii, a month in France, and a month in Germany, and visited China.* ***In 1935 she married the author Donald Barr Chidsey and went with him to Tahiti, where she sailed in his boat and helped to manage a coconut plantation; she also learned Tahitian. While there she made friends with a number of writers, including F. Scott Fitzgerald. Tahiti has often been described as paradise, but the same could not be said of the Chidseys' marriage: Shirley separated from him in February 1940. She went to New York*** *and placed an advertisement in the Saturday Review of Literature for a "Girl Friday"—to do typing, research, and stenography.*

1936 (Sep)

The San Francisco Examiner (San Francisco, California) · 07 Sep 1936, Mon

1 of 2 matches donald barr chids

And we remember MR. and MRS. DONALD BARR CHIDSEY, he a one-time newspaperman turned author. Biography, as we recall, is mostly his dish, and it seems to us that the latest studies of Sir Francis Drake and Sir Walter Raleigh are those that have come from his pen. Right now, though, he's looking for material on anything he can get. If he finds it in Hawaii (he, too, was a Malolo customer) he'll pause to note it there. If not, he may continue on to some other part of the world.

His wife, until she married him a year or so ago, was secretary to Author J. P. Marquand, so she's well used to writers. A little queer as a breed, she says, but not so bad after you get to know them.

*[**Donald Barr Chidsey**] is a handsome, middle-aged gentleman who lives quietly with his wife in Lyme, Connecticut. He is a Justice of the Peace, and is active in the local P.T.A., Boy Scout movement, concert association, and Church. It was not always thus.*

***Donald Barr Chidsey** has covered a good part of the earth in tramp steamers or tramp schooners, pearl shell boats or copra boats, or private yachts. He owned a plantation in the Punaauia district of [Tahiti,] visited or lived in most of the South Sea Islands: the Society Islands, American and Western Samoa, the Australs, the Cooks, the Fiji Islands, the Gambiers, the Tuamotus, New Guinea, Papua, New Caledonia, the New Hebrides, and many others; Central and South America, China, Indo-China, Japan, Malaya, the Near East.*

Mr. Chidsey has been a newspaperman, Broadway actor, farmer, road gang foreman, mountaineer, bartender, boxer, and fencer with foil, épée, saber, schlaeger and broadsword. He was an ambulance driver with the British 8th Army in North Africa, has served also with the 9th Army in Syria, the New Zealanders, the United States army, the Free French in Tunisia, and the 51st Highland Division. Throughout his own adventures, he has always been a writer. Many previous works include the bestselling novels Panama Passage and Stronghold.

These days, Mr. Chidsey hardly ever dreams of returning to the South Seas. He likes it in Connecticut. However, he has a new hobby, stunt flying…

[....]

Career: Newspaperman for ten years on many different papers; writer, beginning 1928. Served with American Field Service in Middle East.

Awards: Boys Clubs of America Junior Book Award for Rod Rides High, 1951; Colonial Dames of America annual book award, 1965, for The Birth of the Constitution.

Here's a para about him from the Saturday Evening Post (8/17/1946), mostly repeating and confirming info you know: "DONALD BARR CHIDSEY, who writes of old Connecticut in DEADLINE AT MIDNIGHT, Page 12 [not included in the original], is one of the newest and most devoted citizens of Lyme, Connecticut, after many years of combining writing and travel. The photograph [sorry, wasn't able to copy that for you] was taken in Quinn's Bar, in Pápete, in 1940. Chidsey lived a relatively long time in Tahiti: He put down stakes, bought a small copra plantation, and stayed six years. He has spent shorter periods of semi-permanent residence in Honolulu and Haiti."

There's a really weird newspaper column written about him that was published in the Florida Times Union in 1998 (talking about yachting during the Great Depression); MeMail if you'd like the full text, as I can't put it online.

SAW PEGMAN AT 2:30 NOV. 9TH

Donald Barr Chidsey, writer, today told the coroner's jury he sat on a bench in Kuhio park with William Pegman, soldier swimmer, at 2:30 a. m. November 9, the day Pegman's body was found in the sea near that point.

Chidsey said he met Pegman at a party at the home of a tourist named Langford, left the party with him, and on leaving him at 2:30, went to the Waikiki Tavern. As far as is known he was the last person to see Pegman alive.

Growing Strife In Tahiti Results In Exodus Of American Residents

Two DeGaulle Factions Battling for Control

Alarmed at inter-factional disputes between two De Gaulle cliques in Tahiti, Americans living in that disrupted South Pacific paradise are hastening evacuation, Charles Borden, owner of the ketch Confucius, reported on his arrival here from Pepeete yesterday.

Some 42 American citizens remain in Tahiti and nearly all are trying to book some sort of passage to Hawaii or the Mainland, Mr. Borden said, while six American yachts bearing citizens who have purchased passage aboard the vessels, are either en route here or are expecting to leave immediately.

No More Visaes

No further visaes are being granted to American yachts to cruise to French Oceania, Mr. Borden said, and the islands are now closed to visitors.

Mr. and Mrs. Borden returned from Tahiti in the 90-foot schooner Wander Bird, 20 days from Papeete. They left the craft at Hilo and came to Honolulu by steamer; the schooner is expected here Sunday night.

En route to Honolulu from Papeete, Mr. Borden said, is the ketch Nara, Capt. Harry Littchen, which left here for the south some months ago. Also coming is the

Visitors No Longer Welcome at Papeete

110-foot teak schooner Robinson, owned by Cornelius Crane, American resident of Los Angeles and Papeete. Mr. Crane, who is coming here to report for the draft, has a French crew.

Southern Cross Due

The Southern Cross, 50-foot ketch under "Curley" Mossman, American businessman in Tahiti, will start for Hawaii soon, as will the Karlchrist, 42-foot Los Angeles ketch owned by Mr. and Mrs. Karl N. Gessler. The latter is bringing Donald Barr Chidsey.

(Continued on Page 2, Col. 4)

Americans Quit Tahiti As Strife Grows Bitter

(Continued from Page 1)

American writer who lives in Tahiti, and all these boats are expected to bring "evacuated" American passengers.

James Norman Hall, the writer, is remaining in Tahiti, Mr. Borden said. Also there is W. H. Donald, former adviser to Generalissimo Chiang Kai-shek. Mr. Donald, an Australian, who exerted much influence in Chiang's government for many years, has retired and is writing an autobiography.

Growing unrest in the isles was described by Mr. Borden.

A Free French destroyer is bound directly for Tahiti on orders of General De Gaulle to attempt to straighten out the disputes, which has resulted from continued arguments over control and policy.

De Gaulle Dissatisfied

French and Tahitian residents in the Society Islands, he said, knew that a warship was en route, bringing a new high commissioner for French Oceania, and considerable concern was felt there because both Gen. Charles de Gaulle and Prime Minister Winston Churchill have expressed dissatisfaction with muddled conditions in the islands.

A large number of Frenchmen, Mr. Borden said, were recently arrested on orders of the Free French governor and are awaiting trial when the warship arrives.

The British consul at Papeete, Mr. Borden reported, was recently mobbed on unfounded suspicion of favoring the Vichy government, and is expected to leave Tahiti soon. Communications, however, are few and far between, being limited to occasional freighters from New Zealand.

Conditions Tolerable

Conditions in Tahiti are not particularly bad, he said, except for shortages in certain commodities. There are plenty of fruits, vegetables and meat, although prices for some foods are very high. Rents are, however, correspondingly low because of a general exodus of non-French residents and because of the lack of tourists, and a four-room house near Papeete may be rented for as little as $6 a month.

Strict censorship is imposed and non-French visitors are generally unwelcome, Mr. Borden reported. Nearly half the residents appear to be in government service, with Tahitians serving as home guards, gendarmes and patrolmen under French officers.

No French or British warships have visited Tahiti in many months, he said, and contrary to reports, there are no New Zealand troops garrisoned there. Business is virtually non-existent.

Going Primitive

"Tahiti is rapidly reverting to its original condition as a primitive South Sea community, since it can no longer depend on outside influences or supplies," Mr. Borden said. "Imports and exports have ceased, the population is falling back on island-grown foods, island-produced clothing and other requirements. But they are rich in natural resources and in their climate, and this works little hardship. Many of us believe it is the best thing that could happen to the Tahitians, who have grown soft in their dependence on Western civilization."

Mr. Borden left his own ship, the Confucius, here, and went to Tahiti as navigator aboard the Golden Hind, returning on the schooner Wander Bird.

1981 (March) - Passing

https://www.nytimes.com/1981/03/26/obituaries/donald-barr-chidsey-biographer-and-historian-of-the-revolution.html?searchResultPosition=1

***Donald Barr Chidsey**, a biographer and author of many books dealing with the American Revolution, died March 17 at Lawrence Memorial Hospital in New London, Conn. He was 78 years old and lived in Lyme, Conn.*

Mr. Chidsey started his writing career when he was about 17 years old on The Elizabeth (N.J.) Daily Journal, his hometown paper. He eventually wrote 50 books including novels.

Among his books on the Revolution was "Valley Forge," "Victory at Yorktown," and "The Loyalists: The Story of Those Americans Who Fought Against Independence." His biographies included "Marlborough, The Portrait of a Conquerer," "Bonnie Prince Charlie" and "John the Great," the life of John L. Sullivan, the American boxer.

He is survived by a brother, G. Alan Chidsey of Port Washington, L.I.

2016-08-truepulpfiction-blogspot-the-pulp-calendar-aug-21.pdf

"**H**ere's a 1937 ***Argosy*** without a table of contents in the Fiction Mags Index. Fortunately, a site dedicated to the pulp writings of **L. Ron Hubbard** has this issue covered with a detailed table. For Hubbard fans or followers, this issue is extra-special because the great man has a letter in Argonotes along with his story "Nine Lives." In the letter, Hubbard defends "fast-production" writers like Frederick Faust and H. Bedford-Jones against snobby critics, crediting them with more nimble brains and "unconscious technique," while saying of himself that " *If I write less than fifty thousand a month, my idea-machine practically breaks down.*" A**s was often the case in the second half of the 1930s, Donald Barr Chidsey gets the cover with the debut of a new series. "Call Me Mike"** introduces Mikkud-Phni Luangba, heir to the real of Kamorriri, and his American companion/bodyguard George Marlin. Mikkud-Phni, aka "Mike," has adventures all around the world when he's not studying at Princeton. The running gag is that Marlin usually is forced into frantic action to rescue Mike, while the prince views everything with placid bemusement -- though he shouldn't be underestimated in a fight. Chidsey published at least three more Mike stories: two in September 1937 and one in 1940. There may be more, since the Mike series isn't recognized in the Fiction Mags Index. The first three stories have "Mike" in the title, but the 1940 story is "Flight to Singapore," and other Mike stories may be similarly obscured. I've read a couple of the Mikes, and they're mildly amusing, though you can see how they'd quickly grow monotonous. Along with these highlights the Aug. 21 issue features serial chapters from Bennett Foster, John Hawkins and Arthur Leo Zagat and stories by Frank Richardson Pierce (possibly a No-Shirt McGee), Garnett Radcliffe and Bertrand L Shurtleff. Hubbard's stuff was pretty entertaining in these early days of his career, so this issue's probably a pretty good overall package. "

Purnell W. Choppin

Born

July 4, 1929 (age 91)

Baton Rouge, Louisiana

Education

Louisiana State University, M.D.

Known for

HHMI President, 1987-1999

Scientific career

Fields

Virology

Institutions

Rockefeller University, Howard Hughes Medical Institute

Purnell W. Choppin is an American virologist. He served on the faculty of Rockefeller University for nearly thirty years, becoming the Leon Hess Professor of Virology. He moved to the Howard Hughes Medical Institute in 1985, became the president of the institute in 1987, and retired in 1999, succeeded by Thomas Cech. He is currently the chair of the Scientific Advisory Board at the Center for the Study of Hepatitis C, supported by a university consortium consisting of Rockefeller, Weill Cornell Medical College, and New York-Presbyterian Hospital.[1][2]

Early life and education[edit]

Choppin was born on July 4, 1929, in Baton Rouge, Louisiana. He attended medical school at Louisiana State University and received an M.D. in 1953.[1] Before beginning his independent research career, Choppin did his internship and residency at Washington University School of Medicine and Barnes Hospital in St. Louis, Missouri. He also served as a medical officer in the United States Air Force.[2]

Academic career[edit]

Choppin began work at Rockefeller in 1957 as a research fellow and joined the faculty there in 1959, heading a virology research program focused on the influenza virus. He became a full professor and senior physician at Rockefeller in 1970, and served in various administrative roles including the vice president of academic programs and the dean of graduate studies.[1][2][3] In 1985 Choppin moved from his position as the Leon Hess Professor of Virology at Rockefeller to the Howard Hughes Medical Institute, where he served as vice president and chief scientific officer. He assumed the presidency in 1987, succeeding Donald Fredrickson.[4] During his presidency, both the institute's budget and its number of scientists increased dramatically.[3][4] Choppin retired from HHMI at the end of 1999, succeeded by Thomas Cech.[5]

Choppin became a member of the National Academy of Sciences in 1977. He received the University of Chicago's Howard Taylor Ricketts Award in 1978 and the National Academy of Sciences' Selman A. Waksman Award in Microbiology in 1984.[3] In the early 1980s, Choppin was among the group of American virologists who helped organize and became the founding members of the American Society for Virology.[6][7]

Richard Douglas Clarke Jr. (born July 23, 1962) is a United States Army four-star general who currently serves as the 12th commander of United States Special Operations Command at MacDill Air Force Base, Florida. He assumed his current assignment on March 29, 2019. He previously served as Director of Operations, Joint Special Operations Command on Operation Neptune Spear.

Military career

General Richard D. Clarke currently serves as the 12th Commander of United States Special Operations Command (USSOCOM) headquartered at MacDill Air Force Base, Florida since March 29, 2019.

Clarke was born in West Germany and raised in an Army family. He is a graduate of the United States Military Academy at West Point, New York, and commissioned into the Infantry Branch in 1984. He holds a Bachelor of Science degree from West Point and a Master of Business Administration from Benedictine College. He is a distinguished graduate of the National War College and earned a master's degree in Security and Strategic Studies.

Clarke has led soldiers at all levels in Airborne, Ranger, Mechanized and Light Infantry units in five different divisions, the 173rd Airborne Brigade, and the 75th Ranger Regiment in the United States, Europe, Iraq and Afghanistan. Clarke spent eight years in the 75th Ranger Regiment as a company commander from 1994 to 1996, then as a battalion commander from 2004 to 2006 and regimental commander from 2007 to 2009. He also served as battalion commander of 3rd Battalion, 504th Parachute Infantry Regiment, 82nd Airborne Division from 2002 to 2004. His most recent assignments include serving as the Director for Strategic Plans and Policy (J5), Joint Staff, the Pentagon, Washington, D.C. from 2017 to 2019. General Clarke's other assignments as a general office include: Deputy Commanding General for Operations, 10th Mountain Division from 2011 to 2013; the 74th Commandant of Cadets, United States Military Academy at West Point from 2013 to 2014; and the Commander of the 82nd Airborne Division from 2014 to 2016.

Clarke's deployments while serving in the aforementioned positions include Operations Desert Shield and Desert Storm, Operation Joint Guardian in Macedonia, three deployments in support of Operation Enduring Freedom, four deployments in support of Operation Iraqi Freedom, and one deployment as the commander of the Combined Joint Forces Land Component Command – Operation Inherent Resolve.[3]

From 75th Ranger Regiment to the Pentagon, Gen. Clarke now helms SOCOM

Kyle Rempfer

April 2, 2019

Gen. Richard D. Clarke took control of U.S. Special Operations Command from Gen. Raymond A. Thomas III during a change of command ceremony in Tampa, Florida, on Friday.

Clarke, 56, is coming to SOCOM from his role as the director for strategic plans and policy, joint staff at the Pentagon, Washington, D.C. He has led soldiers in five different divisions, the 173rd Airborne Brigade, and the 75th Ranger Regiment in Europe, Iraq, Afghanistan and stateside, according to a command news release.

He also served six years in the 75th Ranger Regiment as a company commander from 1994 to 1996, battalion commander from 2004 to 2006 and regimental commander from 2007 to 2009, according to the release.

Now, Clarke will be responsible for syncing special operations forces from the Army, Navy, Air Force and Marine Corps.

As the Pentagon begins to focus more on peer adversaries like Russia and China, SOCOM's new leader will be challenged to maintain the momentum against the violent extremist organizations that once preoccupied the whole of government.

A glimpse of Clarke's agenda

The world continues to evolve and increase in complexity, Clarke told the Senate Armed Services Committee during his Dec. 4 confirmation hearing.

“While violent extremism persists, challenging regional stability and threatening our interest, near peer competitors grow in both capability and intent to contest our vital national interest," he said.

Clarke will be assuming command of a special operations structure that has participated in the defeat of the Islamic State’s physical territory in Iraq and Syria over the past five years, while still wrangling with extremist groups across multiple combatant commands.

In Afghanistan, the Taliban still have an estimated 60,000 personnel at their disposal, according to Marine Gen. Kenneth F. McKenzie Jr., who leads Central Command.

SOCOM troops are in the country conducting advise and assist missions alongside Afghan special operations forces, providing planning and operational knowledge, as well as a vital link to U.S. air power.

Clarke conducted his confirmation hearing roughly one week after two Army Green Berets and an Air Force special tactics airman were killed by a roadside bomb in Ghazni province, Afghanistan.

“We’ve double the amount of Afghan commandos to be able to help with the strategy to put the pressure on the Taliban and I think that effort is bearing fruit," Clarke said.

SOCOM isn’t just focused on counter-insurgency, however. The command is uniquely qualified to counter the maligned activities of Russia and China, Clarke said in December.

Clarke said he wasn’t currently asking for more SOCOM operators, but that missions abroad could expand.

For instance, U.S. special operators are already “conducting training with special operations forces from nations that are within NATO and within Russia’s near abroad,” Clarke said.

Other units within SOCOM, like military information support operations, psychological operations and civil affairs, could also see a boost under Clarke.

“Some are actually stationed in embassies around the world in support of the chief of mission at those embassies. Those help build a network,” Clarke said. “I’m not advocating for additional resources at this time, but I am looking to make sure that the people are prioritized in the right places.”

Gen. Thomas’ retirement

Thomas, 60, has commanded SOCOM since March 2016, and is now retiring after nearly four decades of military service.

“I’m compelled to acknowledge that the opportunity with the SOCOM team has been one of the most rewarding experiences of my life,” said Thomas. “I was quickly amazed by the span and scope of our organizational activities and extraordinary leaders that comprised this eclectic headquarters.”

Acting Secretary of Defense Patrick M. Shanahan presided over the change-of-command ceremony and commended Thomas for his service.

“Since the day you pinned on the black and gold Ranger tab you’ve been leading the way. This includes your numerous combat deployments in support of historic missions from Operation Urgent Fury in 1983 to Operation Enduring Freedom in 2013,” Shanahan said.

Thomas deployed to Afghanistan and Iraq multiple times from 2001 to 2013, and was wounded in combat in 2009, Shanahan said.

"In 39 years of distinguished service, you’ve embodied the West Point motto duty, honor, country,” he added.

By Amanda Dolasinski Staff writer

Posted Oct 3, 2014 at 12:01 AM Updated Oct 3, 2014 at 11:36 AM

After thanking 82nd Airborne Division paratroopers for their service, incoming commander Brig. Gen. Richard D. Clarke looked out onto Pike Field on Friday, assuring them of his leadership.

“What I pledge to this entire division, with all my heart and all my soul, is I will give 100 percent every day and that I will lead by example in all regards,” he said. “I will do my utmost every day to assure the paratroopers and their families are well resourced and well led.”

Clarke became the division’s newest commander Friday after Maj. Gen. John W. Nicholson Jr. relinquished command during a ceremony on Fort Bragg. Nicholson had been the division’s commander since October 2012.

Neither Clarke nor Nicholson were available for interviews Friday.

Clarke was most recently the 74th commandant of cadets at the U.S. Military Academy at West Point, New York. He was born in Germany and raised in an Army family, according to the division.

Clarke was commissioned after graduating from West Point in 1984 and holds degrees from that school, Benedictine College and the National War College.

Clarke has led soldiers in airborne, ranger, mechanized and light infantry units. He has served with five divisions, the 173rd Airborne Brigade and 75th Ranger Regiment, where he spent six years in total, including time as a company commander, battalion commander and regimental commander.

At Fort Bragg, Clarke commanded the 3rd Battalion, 504th Parachute Infantry Regiment, from 2002 to 2004 and later served as director of operations for Joint Special Operations Command from 2009 to 2011.

The general has deployed in support of operations Desert Shield and Desert Storm, Operation Joint Guardian in Macedonia, three times in support of Operation Enduring Freedom in Afghanistan and four times in support of Operation Iraqi Freedom.

During his comments to guests, Clarke said his family has moved 18 times - three to Fort Bragg - for his Army career. This move was supported unanimously by his family, he said.

“We are honored, thrilled and excited but most of all humbled to be joining the ranks of this division and back in the Fayetteville community again,” he said. “This one was much easier because we felt like we were coming back home.”

In addition to his family, dozens of West Point graduates from the class of 1984 attended the ceremony. Clarke joked that they attended out of curiosity and skepticism.

He thanked the paratroopers for their service and urged them to be ready.

“What I ask from each of you is to be ready,” he said. “We are currently in the most vulnerable and uncertain time in this world and that our nation has ever known. We could have as little as 18 hours between alert and wheels up, and failure is not an option. At the end of the day, we will be judged by the American people as to whether or not we accomplished the mission. We must be ready; we will be ready.”

Nicholson had commanded the division since October 2012. He has been selected for promotion to lieutenant general and will next be assigned as commander of Allied Land, Command, NATO in Izmir, Turkey.

The division is the “most highly trained and combat-ready division in the United States Army - indeed, in the entire world,” Nicholson said during the ceremony. “Some have raised the concern that our soldiers in this division are tired. I assure everyone that we are not tired; we are ready. We’re ready to jump, fight and win anytime, anywhere in defense of our nation’s security, and we always will be.”

https://www.shadowspear.com/vb/threads/traditions-continue-as-75th-ranger-regiment-changes-command.1140/

Aug 10, 2007

U.S. Army Special Operations Command Public Affairs Office

By Bonita Riddley And Carol Darby

FORT BENNING, GA, (August 10, 2007) -- In keeping with tradition, Ranger Rendezvous 2007 ushered in the regimental change of command here for the 75th Ranger Regiment, Aug. 9.

Col. Richard D. Clarke continues the historical lineage of commanders as the 15th colonel of the Ranger Regiment as he assumed command from Col. Paul J. LaCamera during a formal ceremony on York Field.

Overlooking a sea of tan berets, Lt. Gen. Robert W. Wagner, U.S. Army Special Operations Command commanding general, presided over the ceremony. USASOC is the headquarters for the Ranger Regiment.

“Some Americans may forget that our nation is at war,” he said. “At war with the global enemy that threatens our very way of life. But nobody on this field ever forgets. America will always be the land the free as it is the home of the brave and you are the brave men that guarantee that freedom, the freedom of our good nation.”

As LaCamera departs command of the Rangers, the premier raid force, for his next assignment at Fort Bragg, N.C., he talked about the men he lead who were not in attendance. Company B, 3rd Battalion and 2nd Bn., are currently deployed.

“I am an extremely fortunate leader and Ranger,” he said. “The men who stand before you on the field today have brothers who are fighting on another battlefield. They represent all that is good in America and our Army.”

LaCamera asked the audience to remember the 11 Rangers who died during his tenure as regimental commander. He added a special thought for retired Gen. Wayne Downing, the third colonel of the regiment, who died suddenly July 17.

“We honor Gen. Downing’s service and character, his value and his lasting contribution,” said Wagner who served with Downing during his Ranger days. “Each of you in formation, honor it by your distinguished service.”

LaCamera explained the moments over the week’s activities and many comments made by Ranger veterans and Rangers alike of deeds past and present.

“As I thought about what to say today, I thought that it really does not matter what I say today. What I said earlier is true; all the great words have been spoken throughout the week. What matters is that deeds speak louder than words. In fact, I have been ‘quote’ writing this speech since I arrived at 3rd platoon, A Company, 1st Ranger Battalion a few years ago.

“I have been extremely fortunate to be blessed with a lot of things,” LaCamera said. “I have met, been mentored and tormented, I have mentored and tormented, lead and been lead by some Ranger legends.”

After serving in multiple positions in 1st, 2nd and 3rd battalions of the Ranger Regiment before assuming command of the unit in 2005, LaCamera spoke to

his Ranger family.

"As for my family. Both families. Since it is like my name, like all of our names. Our first – Ranger. And our last. You have to earn your first name, more importantly, you have to earn it every day thereafter," he said. "To my Ranger family, there are no words to describe the pride, privilege and honor it has been serving with you."

Before assuming command of the Ranger Regiment, Clarke commanded the 1st Bn., 75th Ranger Regiment, Hunter Army Airfield, Ga. His other assignments in the regiment include regimental training officer and commander of the Regimental Reconnaissance Detachment and company commander, Comp. B, 3rd Bn., 75th Ranger Regiment.

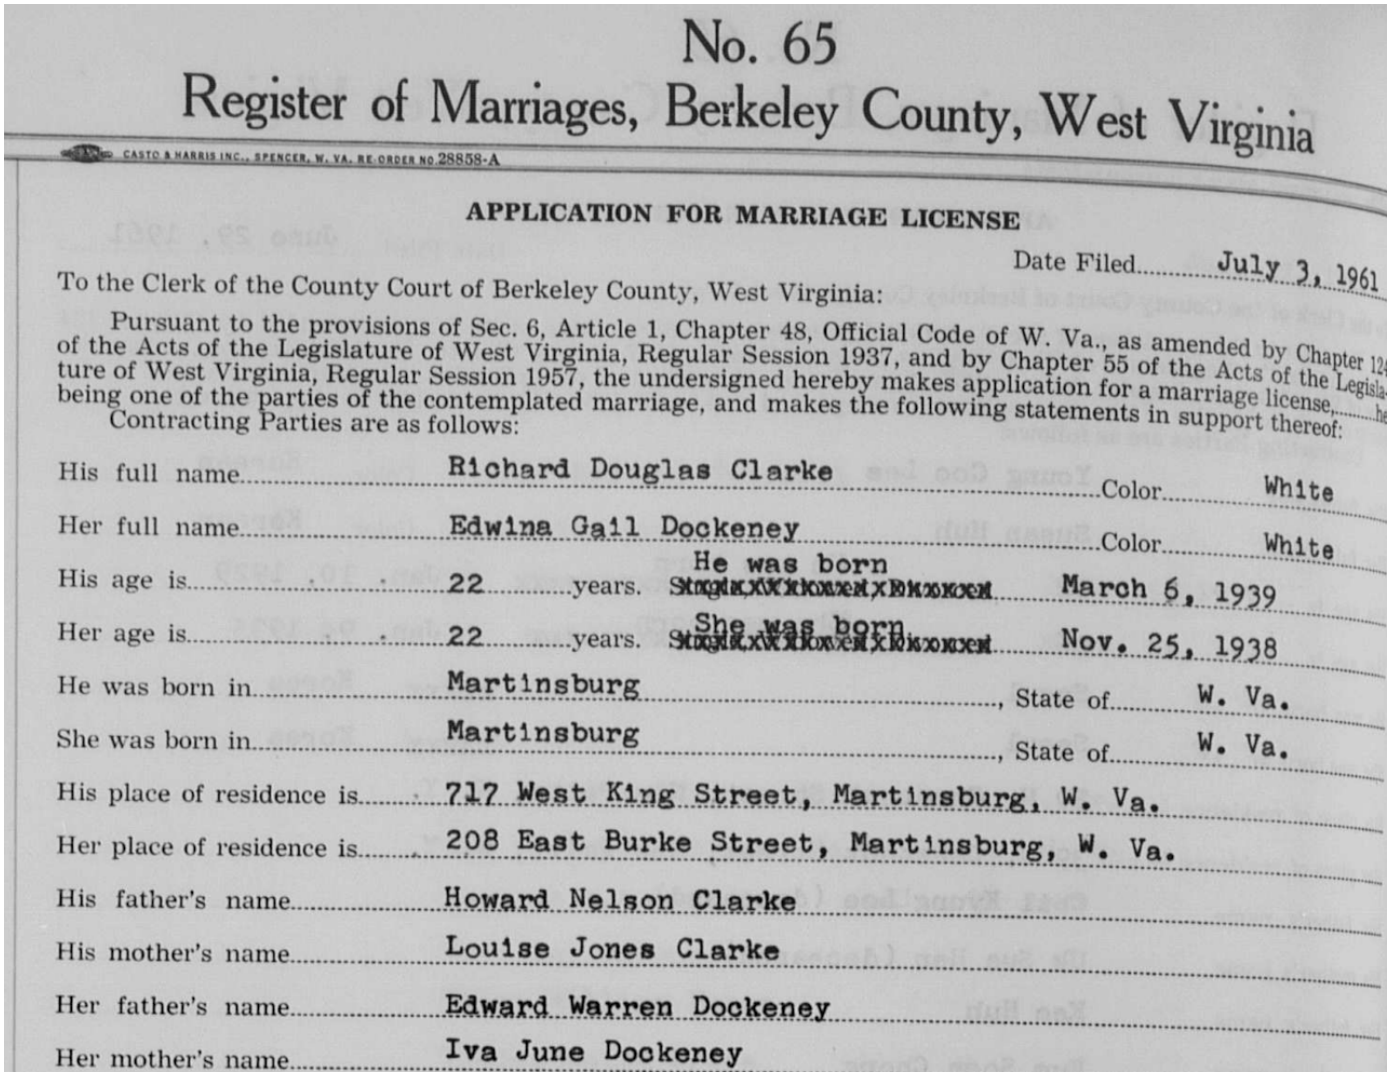
"First and most importantly, to the Rangers in the ranks, and those deployed, the most important group that I will address," Clarke said. "You have borne a tremendous burden since the onset of this war in 2001 and will continue to do so in the future. It is you who deserve the highest praise, even thought you would never seek recognition. I pledge to you to do my utmost each and every day to uphold the prestige and honor of this Ranger Regiment."

Clarke was commissioned as an infantry officer from the U.S. Military Academy at West Point in 1984. He is a graduate of the Infantry Officer Basic and Advanced Course, the Army Command and General Staff College and recently completed a year of study at the National War College in Washington, D.C.

Clarke is a veteran of Operations Desert Storm, Enduring Freedom and Iraqi Freedom.

He has earned numerous awards and decorations to include the Legion of Merit and four Bronze Star medals.

Clarke is married to the former Suzanne Stovall of Beaufort, S.C. They have two children, Madeleine, 9 and Will, 6.



No. 65

Register of Marriages, Berkeley County, West Virginia

CASTO & HARRIS INC., SPENCER, W. VA. RE-ORDER NO 28858-A

APPLICATION FOR MARRIAGE LICENSE

Date Filed July 3, 1961

To the Clerk of the County Court of Berkeley County, West Virginia:

Pursuant to the provisions of Sec. 6, Article 1, Chapter 48, Official Code of W. Va., as amended by Chapter 12 of the Acts of the Legislature of West Virginia, Regular Session 1937, and by Chapter 55 of the Acts of the Legislature of West Virginia, Regular Session 1957, the undersigned hereby makes application for a marriage license, ...he being one of the parties of the contemplated marriage, and makes the following statements in support thereof:

Contracting Parties are as follows:

His full name	Richard Douglas Clarke	Color	White
Her full name	Edwina Gail Dockeney	Color	White
His age is	22 years.	He was born	March 6, 1939
Her age is	22 years.	She was born	Nov. 25, 1938
He was born in	Martinsburg,	State of	W. Va.
She was born in	Martinsburg,	State of	W. Va.
His place of residence is	717 West King Street, Martinsburg, W. Va.		
Her place of residence is	208 East Burke Street, Martinsburg, W. Va.		
His father's name	Howard Nelson Clarke		
His mother's name	Louise Jones Clarke		
Her father's name	Edward Warren Dockeney		
Her mother's name	Iva June Dockeney

Ray Steiner Cline (born 1918)

Wikipedia Ray S. Cline

Saved Wikipedia (Nov, 2020) for Ray S. Cline

See [HK003I][GDrive]

At 1973 U.S. Intelligence Board, 4th from left

Ray Steiner Cline (June 4, 1918 – March 16, 1996) was an official at the United States Central Intelligence Agency best known for being the chief CIA analyst during the Cuban Missile Crisis.

Background

Ray S. Cline was born in Anderson Township, Clark County, Illinois in 1918 and raised in Terre Haute, Indiana, graduating from Wiley High School in 1935. He earned a scholarship to study at Harvard University where he received two bachelor's degrees and a Ph.D..[1]

Cline was the father-in-law of [Stefan Alan Halper (born 1944)].

Career

U.S. Government

In the midst of World War II, Cline joined the Office of Strategic Services. He became Chief of Current Intelligence in 1944. He later traveled to China where he worked with other legendary OSS officers such as John K. Singlaub, Richard Helms, E. Howard Hunt, Paul Helliwell, Robert Emmett Johnson, and Lucien Conein. In 1946, he was assigned to the Operations Division of the General Staff of the United States Department of War, tasked with writing the history of the Operations Division.

Cline joined the Central Intelligence Agency in 1949. He was initially responsible for intelligence on Korea, but he failed to predict North Korea's 1950 invasion of South Korea, which began the Korean War. From 1951-1953, he served in Great Britain under the supervision of Brigadier General E. C. Betts. From 1953 to 1957, he was the CIA desk officer charged with monitoring the Soviet Union and the People's Republic of China; in this capacity, he correctly predicted the Sino-Soviet split. In 1958 he became Chief of the CIA station in Taiwan, with his official title being chief of the United States Naval Auxiliary Communications Center.[1]

In 1962, Cline moved to Washington, D.C. as head of the CIA's Directorate of Intelligence, the agency's analytical branch. He replaced Robert Amory Jr who had held this Office in 1953-1962. Cline played a crucial role in the Cuban Missile Crisis when, under Cline's leadership, the Directorate of Intelligence concluded that the Soviet Union had shipped nuclear warheads to Cuba; Cline was among those who informed President John F. Kennedy of this development.[1]

Cline played a role in the formation of the World League for Freedom and Democracy in 1966.

Cline remained head of the Directorate of Intelligence until 1966, when, disillusioned with President Lyndon B. Johnson, he determined to leave the CIA. His old friend Richard Helms intervened to have Cline posted as Special Coordinator and Adviser to the United States Ambassador to Germany in Bonn.

In 1969, Cline returned to the United States when President Richard Nixon nominated him as Director of the Bureau of Intelligence and Research and he subsequently held this office from October 26, 1969 until November 24, 1973. In this capacity, he oversaw U.S. intelligence in the build-up to the Yom Kippur War.[3]

Academic

Cline left government service in 1973, becoming an executive director of the Center for Strategic and International Studies at Georgetown University. While at the Center for Strategic and International Studies, he became a prolific author on American intelligence and foreign policy. He also became an ardent defender of the CIA in testimony before the United States Congress and in the media.[1]

Cline was head of the U.S. Global Strategy Council.[4]

The creator of the Clipper Chip was an unintentional spook. Clinton Brooks's passion was astronomy. He studied it at Yale during the late sixties, and wanted to make it his career, after fulfilling his ROTC obligations in the navy. His duty was slated for the Pacific, and he planned to move his wife and small children to Hawaii and sail as a shipboard communications officer. He didn't realize that people at a certain intelligence agency had other plans for him.

Several years earlier, Brooks had been assigned for his mandatory summer duty to a location unknown to him: Fort George Meade. He had driven to Maryland, expecting a typical military base. Instead he was intercepted by inscrutable guards outside what looked like a modern office building in the middle of nowhere who told him that only those with high security clearances could enter. To his surprise, a phone call revealed that he already had been granted such a clearance. Welcome, Clint Brooks, to the National Security Agency. He might have thought of this duty as an interlude, but his superiors had apparently taken note of his abilities, and offered him an alternative to the navy. Not only could he remain in the States, but he'd have a chance at a deeper satisfaction—an opportunity to indulge his cosmic yearnings, to a degree, by working in top-secret satellite reconnaissance. He would not, of course, be able to talk about his work to his friends, neighbors, and relatives, because even the title of the satellite organization was more closely protected than the No Such Agency itself. But it sounded good to Brooks. So he declined his commission on the USS Pueblo—the intelligence ship that would be captured by the North Koreans a few months later, on January 23, 1968. He would work at the agency that dared not speak its name.

Twenty-four years later, Clint Brooks was an assistant deputy director at the agency that now did speak its name in public. And he found himself at the center of a crisis that involved the very mission of the National Security Agency: the rise of public cryptography. One day in the late spring of 1992, he walked over to the office of a recently arrived general counsel of the agency to enlist the newcomer's aid in a campaign that, Brooks hoped, might help the agency get through this dangerous passage.

Traditionally, the NSA general counsel is recruited from outside, a lawyer familiar with government work with no particular experience in intelligence matters. Someone who can fit into the cloistered culture inside the Triple Fence, but who retains a sense of the real world beyond. It had been Bobby Ray

Inman who first figured out that a sharp legal mind just plucked from the fray could best forward the agency's business, and provide a level of oversight that perhaps a career spook might not. Ever since Inman's lawyers helped him navigate the agency's problems with academic crypto research, a series of sharp, relatively young attorneys had filled the post for a couple of years, then each had moved on.

Stewart Baker fit the mold. Born in 1947 and raised outside Detroit, he went to law school at UCLA, clerked for a federal judge, then went into private practice for Steptoe and Johnson, one of the most prestigious firms in the nation's capital. He served for a few years in Jimmy Carter's Education Department, then returned to Steptoe. When recommended for the NSA job, he'd been unsure about it. "Should I do it?" he asked a military friend. "What better could you do for your country?" his friend replied.

Baker had occupied his new office for less than a month before Clint Brooks's visit. It was clear that the spindly, square-jawed NSA lifer was a true believer—but in what? Before he spoke, Brooks placed a large bottle of Advil on Stewart Baker's desk. "You're going to need this," he said. Then Brooks laid out the entire story of how cryptography was going public. He told Baker about DES, the strong cipher that wound up in more common use than the NSA had expected, then about the development of public key, and RSA, and the agency's troubles with the new cryptographic community that led to the compromise of prepublication review. And now, he said, the idea that you could control things by vetting academic papers was irrelevant: companies like RSA were selling crypto commercially. Baker was aghast. How did you let that stuff out? he wanted to know.

It wasn't that simple, Brooks explained. The NSA has two roles. One, of course, is cracking ciphers and providing great intelligence to the rest of the government. But the other is to provide the United States with the best possible codes. Inside the Triple Fence, this duality was referred to as "Equities," reflecting, no doubt, that both tasks were equally important. Clint Brooks was the Equities guy at the NSA.

It was a thankless balancing act, because an advance in one mission was sometimes a threat to the other one. In the old days, at least, the debate was confined inside The Fort, but now it took place in the halls of Congress and in the pages of the New York Times. Meanwhile, the specter of widespread encryption was like a train bearing down not just on the NSA but on society in general. Like the cypherpunks, Clint Brooks looked into the future and saw crypto everywhere. But while the crypto rebels embraced the vision, Brooks understood that this new reality was a potential disaster, if the agency did not adjust.

This was gospel that Brooks had been preaching for several years, at first to deaf ears. During most of the 1980s, after director Inman's first skirmishes with the crypto academics, most people at the agency hadn't been much concerned with the possibility that public cryptography would affect them in any significant way. Strong export laws kept everything under control, assuring that nothing as strong as DES left the country without restrictions. In the chill of the Cold War, Congress always gave Fort Meade what it asked for. And though an occasional in-house Cassandra would cite some pundit's prediction that in two or three years widespread commercial crypto would take off, it never did seem to happen. So it was easy to think that it might never happen. Brooks knew otherwise. Beginning around 1988, he came to understand the direction the Internet was taking and realized that, this time, the threat was real. But his superiors laughed when he tried to lecture them. What are you talking about? they'd say. We're the only cryptographers! This is a military technology, not something that people want to use! Only when an Internet revolution became plausible, and companies like Lotus actually started to build crypto like RSA into their products, did the top levels of the agency come to realize that Brooks had a point. So they authorized him to find some sort of solution to this conundrum. And Brooks had indeed come up with one.

That was the reason for Clint Brooks's visit to Stewart Baker: to get him on board with the plan. There was, he explained, a possible way out . . . a solution that not only could give the unprecedented protection of strong crypto to the masses, but that would also preserve the government's ability to get hold of the original plaintext conversations and messages. In fact, for the past three years, Brooks revealed, the NSA had been creating such a scheme. It involved a technique known as key escrow.

The project had begun in 1989. Brooks, in his role as Fort Meade's Equities man, had been racking his brain to figure out how to reconcile the two seemingly incompatible demands: the need for strong public codes and the agency's need for plaintext traffic. Clearly, no solution was perfect. The idea was to strike the proper balance, giving users of nonclassified information both inside and outside the government a healthy measure of security, but not so much that the public's safety was abridged. At the time the NSA, acting in accordance with the Memorandum of Understanding, had formed the working group on cryptography with the National Institute of Standards and Technology. In NIST's acting director Ray Kammer, Brooks found a kindred soul. The two of them spent hours going over the problem, probing the technical and even philosophical aspects of a crypto policy.

In one of their early discussions, Brooks and Kammer had simultaneously had an epiphany: the use of encryption would have a profound effect on law enforcement, particularly in its ability to continue wiretapping. They began visiting people in the Justice Department and the FBI, none of whom had the slightest inkling of the troubles that lay ahead. Brooks or Kammer would tell them that all the authorizations to wiretap in the world might not help them when crooks used encryption, and their jaws would drop. Can't you help us? the law enforcement people would ask.

Brooks had once assumed the solution might lie in a giant deception. The agency could create a putatively strong cryptosystem, so apparently strong that companies would build it into their products and export it around the world. But the agency would have built in a "trapdoor," to allow the NSA secretly to derive plaintext from encoded transmissions. But after some clear thinking, he discarded that risky, and questionably legal, idea. Such a scheme would entail getting decrypted messages from U.S. citizens. You might be able to justify a hidden trapdoor to snoop on foreigners, but if Congress or some investigative reporter discovered that the NSA had launched a clandestine surveillance plan against Americans, the Church committee would look like a picnic.

So Brooks spent nights awake trying to conjure some other idea. On one of those nights, he had a flash. There could be a compromise that could satisfy everybody. In the physical world, a search warrant compelled a suspect in a crime to give authorities the combination of a safe. Why not translate that concept to the world of communications and computers? If you created a system by which special duplicate encryption keys were somehow spirited away and stored in secure facilities, you would essentially be holding lock combinations in escrow, unavailable to anyone but those who had authority to retrieve them. Those with that legal authority—a search warrant from a judge or an understood set of national security criteria—could get the keys from the trusted storage facility. Once that access was assured, there would be no problem in allowing the encryption itself to be as strong as anyone liked. Make it uncrackable! If the FBI or the police needed the key, and a judge concurred, then they'd have the wherewithal to decipher it, just as if they were the intended recipients.

To some people at the agency, the scheme was a heresy: You're going to put a back door into a cryptosystem . . . and TELL people about it? But full disclosure was a critical part of Brooks's vision. He really wanted this new scheme to kick off a national debate about cryptography. Only then, he believed, could an escrow scheme, which would require an elaborate infrastructure, be established. With the government no longer concerned about getting hold of encoded messages, the path would be free and clear toward a universal blanket of crypto, with organized public key distribution, standardized digital signatures, and automatic encryption of messages. The privacy nuts and conspiracy freaks would raise hell at the idea of escrowed keys. But if all the issues were aired, all the dangers addressed, all the benefits sketched out, surely reasonable people could see that this plan was the best way to protect our communications

without sacrificing our safety. Anyway, what was the alternative?

Of course, if such a scheme were to be launched, the NSA itself would have to change, readjusting its focus so it would operate in a highly computerized—and crypto-ized—post–Cold War world. The intensity with which The Fort still maintained its veil of secrecy was no longer appropriate. If the people were to buy such a radical idea, the NSA would have to earn their trust. Thus it was imperative to bring the debate on cryptography to the public, treading on once forbidden areas with brutal honesty.

Brooks eventually got approval to pursue his plan, but his idea that the NSA should collaborate with the general public was received with skepticism or worse. He found himself arguing like some deranged Jeremiah. "This has got to be a national policy," Brooks said at one meeting of the top NSA officials. When asked by a deputy director to explain further, he replied, "This isn't a judgment that can be made by the director of the National Security Agency or a committee of deputies . . . it's a value judgment as to what's in the best interest of the country. It has to be decided by the president of the United States." The official who answered directly to the voters! His peers thought he'd gone off the deep end. This was the National Security Agency, their attitude was, and we don't do that sort of thing.

While waiting for the public debate to take shape, Brooks was working hard with other agencies to set up a structure for his ambitious key escrow plan. Because of the Memorandum of Understanding, of course, the agency would have to develop the scheme with NIST. But that was no problem. The joint technical working group had been working on the public crypto situation since the very first meeting in March 1989, particularly on the digital signature algorithm. Public crypto was known within the group as Issue One.

A third stakeholder in the discussions was the FBI. The early alert from Brooks and Kammer had indeed awakened interest at the bureau: in 1991, director William Sessions had written to defense secretary Dick Cheney about computer security, clearly indicating that his agency wanted a voice in determining policy. The FBI, it turned out, would actually assume the hardest line on the issue.

The NSA, of course, did the technical heavy lifting. By 1990, thirty of its mathematicians were working on the problem. They quickly settled on the bedrock of the system, a powerful encryption algorithm that had been kicking around Fort Meade for a couple of years. Its codename was Skipjack. It was a block cipher like DES but was deemed much stronger. Its recommended key length was 80 bits as opposed to DES's 56; it used 32 rounds of substitution instead of 16. (There appears also to have been some more subtle technical reasons for Skipjack's superiority, but of course, the NSA was loath to reveal these.)

Though Brooks tried to argue that in this new era, it might be appropriate to reveal the algorithm— insisting, in fact, that to win over their critics they would probably be forced to publish it anyway—he met with staunch resistance. Never—never—would the agency allow its foes access to what amounted to an advanced course on the cutting edge of codemaking. Things don't work that way at The Fort.

Skipjack, though, was only a single component of what the NSA called Capstone, which was a complete public key system that would include the digital signature standard. Of course, this particular scheme had an additional complication: how would you implement the escrow? You'd have to figure out a way to isolate a copy of each key and send that information elsewhere for storage. By 1991, the NSA decided that trying to do this in software was too risky—it feared that some foe could change the code to build in a weakness—and concluded that a better method would be to put the whole shebang on a tamperproof computer chip. An experienced defense contractor in Torrance, California, called Mykotronx was hired to fabricate the chips.

The system itself worked by inserting several new components into the classic equation where Alice encrypts and Bob decrypts. One of them was the "unique chip identifier." It was a number that matched up with a "chip unique key" that was assigned to a single physical chip. Each device—a computer or perhaps a phone—would have its own unique chip identifier and chip unique key.

When two people wanted to communicate privately, they would each have one of those devices. If, for instance, they wanted a phone conversation that an eavesdropper couldn't hear, they'd have special phones with the technology built in. Once the connection was made, the phones would zip signals to each other (via a Diffie-Hellman exchange) to calculate a new symmetrical key, called the session key. Using Skipjack, that key would actually encode the sounds of each speaker as the sounds left the phone and decrypt those sounds as they emerged from the other phone. But along with the encrypted conversation, the phones would transmit another set of bits, called the Law Enforcement Access Field (LEAF). (It was originally called the Law Enforcement Exploitation Field, but was changed to a somewhat less ominous term.) The LEAF would be generated by a set of calculations involving the session key, the chip unique key, and the unique chip identifier, winding up with two important components: an encrypted version of the session key and the unique chip identifier. All of that would be further scrambled by the family key.

So how would officials get hold of those keys? They would already be in possession of one of them, the family key—there's only one in the whole system. The tricky part of the scheme would be getting the proper chip unique key and, ultimately, the session key. This would be performed by way of the LEAF.

What if an eavesdropper captures the information on the LEAF? Even if he could isolate the chip identifier from the LEAF, it would be useless. All the identifier would do, really, is identify. It would point to a chip unique key in a vast database. But only the government wiretappers would have access to that database, stocked with every chip unique key in existence. Having that identifier without a way to get into the escrow facility would be like having someone's fingerprint and no access to crime records: it would be of no help whatsoever in telling you who it identifies. But a government agent would be able to take that identifier, along with a court order, to an escrow facility, and match it up with the chip unique key. And then combine it with the family key. Viola! You'd have the session key—and the fuzz of an encrypted conversation could be transformed into blessed, perhaps incriminating, plain language.

That led to another complication. Where would the escrowed keys be stored? If they were all kept in one place, it would be a potential gold mine for all sorts of crooks, spies, and even corrupt U.S. government agents—anyone with access could get hold of the means to violate the privacy of every encrypted conversation in the world. So Brooks and his colleagues decided that the escrowed keys would be split into two pieces that would be stored in different locations. This would be done in such a way that obtaining one piece of the key would provide no mathematical advantage in discovering the entire key. When a judge authorized a wiretap, the law enforcement officer would present the warrant to both escrow agents, construct the key, and then have the wherewithal to listen to the conversations.

In late July 1992, all the relevant government agencies met for an off-site meeting at the FBI's Engineering Research Facility in Quantico, Virginia, to discuss the alternatives for a national encryption policy. Clint Brooks made the opening presentation. As recorded by one official in attendance:

> He presented these within the context of a national goal that would satisfy the need for good commercial and unclassified cryptographic security while protecting the interests and responsibilities of national security and law enforcement organizations. He termed the achievement of this goal "Nirvana."

The agencies didn't reach total agreement. Notably, the FBI apparently was arguing for the ability to do its decrypting instantaneously, or in "real time," an

approach that the NIST people deemed "draconian and intrusive." (The FBI approach would essentially dictate that the escrow facilities should be a phone call away at any time, and safeguards against abuse would go out the window.) But they all agreed that a system should provide encryption for the public while allowing the cops and the spooks access to the keys—essentially, the NSA solution.

Until the whole government got behind it, the escrow scheme was just another flashy technology concocted behind the Triple Fence. In order for it to work, it needed to be ubiquitous. As Brooks had anticipated—and as his superiors finally came to understand—such a sweeping change needed the imprimatur and active support of government's highest level, up to George Bush himself. But an election was approaching, not the time to air potentially controversial new ideas. In any case, the Bush people seemed unconvinced of the urgency of quick action. Brooks figured that in 1993, after Bush was returned to the White House, the reelected president would be able to tackle the problem, free from worries about what the electorate might think.

But in 1992, two unexpected events dramatically shaped the course of Clint Brooks's key escrow scheme. The first one involved an innovative product about to be introduced into the marketplace—a twenty-four ounce box that connected to the telephone. That pound and a half of technology portended tons of problems. The second development was the election of a new U.S. president.

The box's technical name was the AT&T Telephone Security Device (TSD) 3600. For several years, the telecommunications giant had been manufacturing secure phones for the government, using a special NSA-designed algorithm. In 1992, the company decided to broaden its market outside the government, and began limited sales of a voice data scrambler that used an encryption algorithm devised by AT&T's own crypto team. That autumn, it decided to follow up on an even wider scale—by launching a secure phone designed to sell by the thousands. If you were worried about snoopers listening for sensitive data involving intellectual property, trade issues, and business strategies, you'd want one of these. You didn't have to be an engineer or a nerd to use it, either. "It connects easily to desk telephones or . . . mobile cellular phones," gushed company literature. "And it's as easy to use as it is portable. To protect conversations, the user simply pushes a single button. The call is automatically encrypted and the conversation secured." AT&T also claimed that the voice quality on this device was, unlike the relatively fuzzy phones that the military used, almost as good as that of a regular telephone.

What's more, this new phone would use the most trusted encryption algorithm of all to scramble voice: DES, the cipher that was still a hot button behind the Triple Fence.

The NSA, of course, was unhappy at this new use of the problem child it had once blessed. But news of AT&T's plan was even more troubling to the FBI. The law enforcement agency had already been complaining that new telephone features like cellular service and call forwarding were making it more difficult to implement wiretaps. Its solution was to propose a new bill, known within the Beltway simply as "Digital Telephony." The law would mandate that all new telecommunications equipment be designed with wiretaps in mind; it essentially banned new devices and services that denied the government an easy way to conduct surveillance. Critics were already howling. It was bad enough that the bill would cost equipment makers hundreds of millions of dollars (presumably a cost passed on to consumers). Much worse was the central premise behind the legislation, which required the tail of wiretaps to wag the dog of telecommunications. Instead of encouraging one of the country's most innovative industries to produce the systems that would sustain America's high-tech success in the global marketplace, Congress would be locking a ball and chain on innovations. And for what? Just to keep its ears open to approximately 1000 annual federal wiretaps, to glean information that could arguably be recovered by other means, like hidden bugs or informants?

Though Digital Telephony didn't mention cryptography specifically, the specter of crypto restrictions hung over the legislation like some digital Sword of Damocles. As Brooks and Kammer had explained to the FBI, strong crypto could totally screw up the benefits of the bill. Even if Digital Telephony passed, and the industry faithfully followed its strictures, the G-men and other police agencies would be able to monitor the transmissions sent over the wires or the air—but then what? If those communications were scrambled, those precious intercepts would be no more than useless static. FBI director William Sessions got the message and made sure that G-men would be participants in the NSA–NIST effort to deal with the problem.

Now the FBI was freaking. Here was this new AT&T phone, designed to move secure-phone technology from a status item on the desks of national security advisors to a common commercial product, one used by executives, lawyers, and scientists, not to mention privacy nuts, crooks, terrorists, and God knows who else. It would be a law enforcement disaster . . . unless there was a way that the government could somehow overhear those conversations as they were before encryption. Wasn't that what Clint Brooks had figured out? So Brooks and his team were asked if the Capstone chip might go into the AT&T phone. As the Capstone was originally conceived, it was too demanding for the TSD 3600—with all its features, such as the digital signatures, it would require more computation than the device could handle. But maybe if the NSA carved out just the encryption algorithm and key escrow, it could come up with something that could simply be clipped into the phone in place of the DES chip.

Even while agreeing that it could be done, Brooks was wary. The Capstone chip was well designed and represented a complete solution. Coming up with something new would be riskier—and to do it in time to stave off the AT&T phone, it would have to be done very quickly. There would be no time for the national debate he felt was so essential.

But the FBI couldn't wait. On October 13, 1992, Judge Sessions himself placed a call to AT&T's chief executive officer Robert Allen. We've got a problem, he told him, and then outlined problem and solution: Would AT&T consider using an escrow encryption chip instead of its DES-based system? If the company agreed, the feds could offer considerable carrots. For one thing, AT&T could claim that it was actually providing mightier encryption, since Skipjack was much more difficult for outsiders to crack than DES. Furthermore, the United States would probably allow this key escrow phone to be exported. Best of all was a promise directed toward the bottom line: the federal government would buy thousands of units for its own use.

The downside, of course, would be that potential corporate buyers would have to buy into the basic compromise that escrow entailed: the encryption would be strong, but one not necessarily welcome third party would also have a copy of the key.

Sound familiar? It was the same situation that Whit Diffie had found utterly intolerable two decades earlier: the difficulty of two people seeking intimacy when someone else is in the bed. Diffie had invented public key in order to avoid this perversion of the cryptographic relationship. Indeed, the AT&T phone as originally conceived was an embodiment of Diffie's vision. The users of the phone would not need to exchange secret keys beforehand. Instead, the two respective phone devices would furiously perform the calculations of a Diffie-Hellman key exchange, in order to settle on a secure DES key that would encrypt, and then decrypt, the actual conversation. No need for anyone else. You wouldn't want anyone else.

But the bounty offered to AT&T—and the chance to avoid a government confrontation—was too juicy to turn down. The phone company signed off on a deal: if the government would adopt a plan to make key escrow its standard, AT&T would forgo its DES scheme and install a government-designed chip in the device instead. This would be the stripped-down version of Capstone, using the Skipjack algorithm and the escrow features, but without the signature or hashing algorithms. It was given a new code name: Clipper.

"We knew no decision would make everybody happy," said an AT&T spokesperson. "But frankly, the Clipper Chip offered an important law enforcement issue and increased the level of protection." More to the point, it also offered guaranteed sales, and the continued goodwill of one of AT&T's major customers, the

and increased the level of protection. More to the point, it also offered guaranteed sales, and the continued goodwill of one of AT&T's major customers, the United States government (at the time, the company was negotiating a government contract worth over $10 billion). If key escrow became government policy, AT&T would happily be on board.

But Clipper was still nowhere close to being the official government policy. Clint Brooks and the NSA needed one more big break before they could begin their journey toward Nirvana. That break came on November 3, 1992, when the United States went to the polling place and elected William Jefferson Clinton its president, with Albert Gore as his vice president.

It might appear counterintuitive to think that those election results favored the NSA. After all, Clinton was a Democrat who had spent the Vietnam years speaking against the conflict instead of fighting in it.

During the campaign, Clinton had visited Silicon Valley, and while he had made no promises, he indicated that his presidency would be a friend to private crypto. "He talked about how silly it was that there were export controls on off-the-shelf software," remembers privacy advocate Marc Rotenberg. "He didn't say 'encryption' specifically, but that's clearly what he was referring to."

Another sign that Clinton might not be NSA-friendly was the nature of the people surrounding him. For instance, the head of his transition team was a former electronics lobbyist named John Podesta, who had vociferously supported the industry agenda of liberalizing export rules. Besides Podesta, Clinton's minions included a number of people who seemed tuned into the hip and crypto-friendly cyber world.

Chief among that contingent was the vice president himself—a self-styled computer aficionado to whom Clinton would delegate the ultimate decision on the cryptography issue. In fact, Al Gore's presence as the nation's second-in-command was often cited as proof that the new leadership team was a nerdfriendly future squad who "got" the new Internet paradigms. Their campaign speeches might have been about bridges to the future, but Gore's vision was of an Information Highway to transform the country and indeed the globe. Gore arranged to bring some of the most techno-savvy Senate staffers to the White House to help on digital matters, people like Mike Nelson, a former MIT geophysicist experienced in Info-Highway issues. They were "extremely smart, conscious freedom-lovers," wrote John Perry Barlow, who got to know them in his role as Electronic Frontier Foundation cofounder. "Hell, a lot of them are Deadheads. I was sure that after they were fully moved in, they'd face down the National Security Agency and the FBI."

Barlow had mistakenly assumed that because the Clinton staffers recognized the opening chords of "Sugar Magnolia," they'd be immune to top-secret doom lectures from the star-spangled crypto boys at Fort George Meade. Behind the Triple Fence, the expectations were just the opposite. The spooks understood that Bill Clinton and his peach-fuzz tech squad were a godsend for the escrow idea. The Bush administration had never warmed to the escrow plan. The problem wasn't so much that the Bush people were specifically against this particular scheme. They were against anything that required a little gumption. "The Bush people had spent twelve years in power, most of them with a Democratic Congress, and they knew that everything that could blow up, would blow up," one insider explained. "When you presented something to them, you got nothing but eyes staring out. . . . You could sense that everyone was thinking, 'How might this end up on my suit?' "

In contrast, the Clinton people were policy joyriders, like teenagers finally granted their turn behind the wheel. They were totally juiced that after twelve years of dinosaur rule, they now had their chance to fix things. They were also detail freaks, eager to belly flop into the huge piles of clauses, footnotes, and trivia that embodied the process of governing. Present them with an idea and they surrounded it, tickled it, tore it apart to see its gears rattle, and wondered how they could make it work for them. They drew confidence from a belief that their own good intentions were obvious, and even if their efforts didn't pan out, the public would give them credit for trying to do the right thing.

The forces pushing key escrow didn't even wait until the new administration reached the White House before they hit Clinton and Gore with the encryption problem. The AT&T phone threat provided an impetus. "Suddenly this wasn't something where we could wait, do an orderly briefing of the new administration, let them get their feet under them, appoint their assistant secretaries, and make a decision in 1994," says Stewart Baker. The idea of getting George Bush to sign off before vacating the White House had been considered, but rejected. "We believe that going forward with the installation of the Clipper Chip based on the approval of the current administration has some potential pitfalls," wrote an FBI official to director Sessions in a late-1992 memo. What if the news of an "exploitable" chip leaked before the Clinton people formally approved the policy? "It might result in their being pushed toward disavowing the prior Bush administration approach in order to prevent the controversy."

Judge Sessions himself, whose fear of losing precious wiretaps had made him increasingly frantic on the issue, was the first one to hit Little Rock. "It had become his highest priority," says a government official working for key escrow. "He was fearless in going to the transition team and saying, 'You guys may be coming in January, but you've got to hear this now.' " In any case, the NSA was just as happy to let him lead. After all, Fort Meade's stated role in government was not promoting policy decisions but providing technical background and intelligence information from its files.

To frame the issues, the FBI, with the NSA's help, prepared a paper entitled "Encryption, Law Enforcement, and National Security." The classified document was packed with high-impact scenarios of what might happen if crypto ran free. It discussed the AT&T device as a possible trigger for this onslaught. But the coming disaster might be averted. "The solution is an encryption chip that provides extra privacy protection (at least a million times stronger than DES) but one that can be read by U.S. government officials when authorized by law. . . . This 'key escrow' system would protect U.S. citizens and companies from invasion of their privacy by hackers, competitors, and foreign governments. At the same time, it would allow law enforcement to conduct wiretaps in precisely the same circumstances as are currently permitted under the law." While the description sounded very much like a panacea to an otherwise apocalyptic problem, the paper did include one possibly annoying consequence of the policy:

"This concept undoubtedly will be vigorously attacked by those who fear law enforcement abuses and thus would rather rely on technology than on the court to protect their privacy." But that seemed rather an easy trade-off to make. Which would you rather tolerate—a bit of flak from privacy nuts, or a powerful weapon in the hands of kidnappers and terrorists?

Stewart Baker was the NSA's point man on the issue, and wound up coordinating much of the effort to sell escrow to the incoming leadership. While Fort Meade was packed with geniuses, it wasn't as loaded with people who were comfortable dealing with the outside world. Baker had come a long way since Clint Brooks had come to his office and first told him about Equities. In that time, he had gotten a good view of the cryptographic landscape from the NSA point of view. He saw where it all fit together. You couldn't mandate what people inside the country used nor could you keep every copy of a program like PGP away from every geek on the globe. But realistically, not many people were going to take the trouble to find exotic encryption software like PGP and figure out how to use it. Export controls were the way you stopped good crypto—everything from DES on up—from being built into the systems people used every day, and thus, out of the hands of most bad guys.

Baker saw the Clipper scheme as a way of weaning the government from its dependence on export controls to contain crypto. There were signs that Congress might not support those regulations indefinitely. The business community was getting louder and louder in its opposition to them. The problem

was, the software industry had grown up in an environment with few regulations, and was now a multibillion-dollar colossus. It felt that the natural order of things was to fight things out in the marketplace while the government remained some distant entity. The techies seemed to regard the premier crypto agency in the world as some doddering, irrelevant artifact of the Cold War. Their philosophy was hey, technology happens. Baker was horrified once when a Microsoft middle manager blithely told Baker that Bill Gates was going to put crypto into the Microsoft operating system, that it was going to be in all the applications. Who cares whether it would empower terrorists or rogue nations? Their attitude was, "Encryption is cool, let's put it anywhere."

The techies weren't unpatriotic, Baker thought, just clueless about the very real dangers in the world. They thought it was a joke that crypto was classified along with heavy munitions. But the ability to listen in on the world—with a vast multibillion-dollar network of secret satellites, radar installations, and ground sensors—was a pillar of U.S. defense policy. How did they think we discovered those Libyan terrorists who brought down the Pan Am jet over Lockerbie? How else to keep track of the North Korean nuke program or Iraq's use of chemical weapons against the Kurds? The public had only heard hints of the importance of those "intercepts," signals snatched from telephone conversations, digital transfers, and even walkie-talkie transmissions. Most of it was classified, deep black stuff. That's why there were no reporters when George Bush himself had ventured to The Fort to extend his personal congratulations to the codebreakers for their work during the Gulf War. Just what did the spooks do? If the public only knew. . . .

Baker and his fellow advocates of escrow thought it essential that the worldview taken by the new administration be a more realistic and tougher one. Encryption should be an important part of the Networked Society, sure, but you needed controls. You needed limits. You needed a way for the good guys to hear what the terrorists and crooks were saying to each other.

Early in the campaign to win the hearts and minds of the Clinton people, Baker and Sessions briefed Leon Fuerth, who would become Al Gore's national security advisor. Though Fuerth was cautious, the escrow advocates could see that their presentation had hit the mark. They thought they could see it in his face: the realization that the election campaign was over and now the Clinton folks were going to be wrestling with some hard, hard issues. This was one that the NSA and the FBI could win.

As December rolled on, the briefings continued. And not long after the inauguration, Al Gore himself got exposed to the religion by NSA director McConnell and Clint Brooks. It was a bull's-eye for The Fort. Because Gore loved technology, he was able to appreciate the ingenuity of the key escrow scheme. A neo-Luddite Republican might have fuzzed out on those particulars, but Gore's openness toward the idea seemed tied to his perception that these software gears and levers might actually work, providing a solution that gave something to everybody.

As the Clinton-Gore teams shifted from transition to governing, the Clipper people stepped up the meetings. Memos flew between the NSA and NIST on how best to anticipate and respond to possible objections. They knew one potential problem: Fort Meade's insistence on keeping the Clipper's workings a secret from the public. Brooks tried to convince his colleagues to open up, but failed. His fallback plan was somehow to gin up some assurances that the NSA hadn't intentionally weakened Skipjack for its own purposes. "Get a panel of academics from cryptomath/analyst community to examine classified level SKIPJACK to 'assure' it is valid/good algorithm," he scrawled on a memo to his director on January 5. "Who should it be?"

Meanwhile, in the White House, the barrage of briefings was having its effect. In their first weeks in office, Clinton and Gore hadn't signed off on Clipper. But their staffs were coming to the conclusion that there was no other alternative.

John Podesta was already on board. Maybe his personal tipping point came very early after the inauguration when some high-tech lobbyists came to visit him. At this point, civil libertarians and software industry people were still hoping that the new administration would act against the spooks and the cops and liberalize crypto export regulations. (If they'd known about the Clipper Chip they would have gone ballistic.) Podesta, still dazzled by the new toys in his office, showed them his STU-III phone, the standard-issue crypto phone the government had used for about five years. They sneered at it. "Typical clunky government solution," they said. "But you know what's cool? AT&T is going to make a device that's half the size, much cheaper, and will do everything that one does, but better. You should buy those!"

Though the high-tech guys didn't know it, their comments resonated with the briefings Podesta had been getting. If the government didn't do something, those damn devices probably would sweep the market. Not that the NSA/FBI Clipper cabal was relying on serendipity to bring the Clinton folks around. They were essentially stacking the deck, presenting a limited set of options to the greenhorns. Want to do nothing, and let the marketplace take its course? Fine. If you want to trigger crypto anarchy, that is.

Doing nothing, they warned, would mean that AT&T would begin selling its phones and the next thing you knew the costs would come down and everybody would be talking on secure phones and e-mailing with crypto software. The smoke had hardly cleared from the World Trade Center bombing. What if another, maybe a worse, terrorist disaster came, and it turned out that the government failed to prevent it because the perpetrators were able to communicate with unbreakable crypto? You want to give Saddam Hussein access to ciphers we can't break? Go ahead—do nothing. The blood will be on your hands. This terrified the Clinton people.

The other alternative, which some law enforcement hardliners were urging, was even more extreme: ban crypto within the United States. In one of the FBI's presentations, illustrated by a slide show with bullet charts to underline the salient points, the G-men merged their Clipper-related goals with their Digital Telephony vision. Essentially, the show said: because the domestic use of encryption is not regulated, there is a NEED FOR A NATIONAL POLICY that allows "legitimate" users crypto strong enough to foil their adversaries but also "insures that cryptographic devices and systems are capable of real-time encryption by law enforcement." The implication was unavoidable: any cryptography that does not meet that standard should be prohibited. Even stuff distributed by American manufacturers for American users. Otherwise, an intolerable "electronic sanctuary" would exist. Forget about the strategy of using export controls to mitigate what people used inside the country. . . . Our nation was at risk because such tools were legally available to anyone motivated enough to find them. Just as it was illegal to have nuclear weapons lying around, it should be illegal to have codes that could fall into the hands of those who would destroy society with it. In a weird way, this sentiment echoed Phil Zimmermann: when crypto is outlawed, only outlaws will have crypto.

The Clinton people did manage to resist that demand, which would have started riots in Silicon Valley and probably wouldn't have survived a court challenge anyway. The Gore team in particular was sensitive to the idea that the emerging Information Highway needed privacy protections. Besides, how would you enforce such a ban? What did these guys want the government to do, go house to house and search people's hard disk drives for copies of PGP?

So, after being presented with two unpalatable alternatives, the Clinton people were offered a third way, one which, in contrast, seemed a compromise with which everyone could live. In retrospect, one administration insider came to see it as akin to the choices offered the Kennedy people on the invasion of Cuba —a cowardly evasion of the problem, a destabilizing full-scale military operation, or this other plan, a small operation at some place called the Bay of Pigs.

The scheme was presented to the Clinton people as plug-ready, poised to go into operation as soon as the president gave the word. Even temporary inaction would mean a severe and probably lingering loss of respect from the law-and-order constituency the administration needed. One of the FBI men briefing the

Clinton people was a burly, street-smart assistant director named James Kallstrom. Formerly head of the bureau's technology team, he had made his bones in the bugging operation that took down John Gotti.

Some people described him as the FBI's version of "Q," the gadget wizard of the James Bond films. He had an in-your-face style of briefing, making eye contact and personalizing his rap. Are you married? Do you have a child? he'd ask. Then he'd launch into a scenario in which someone had kidnapped one of your kids and was holding him in a fortress up in the Bronx. The bureau suspects your kid is there; they have a search warrant to find him. But the crooks have constructed the fortress out of some new metal that can't be penetrated. Your kid's potential rescuers can't get in. What a nightmare: the kidnappers, with their precious hostage, watching you and the G-men trying to get in and laughing at you.

"That's what the basis of this issue really is," Kallstrom would say in his New York accent. "From the standpoint of law enforcement, there's a super-big threat—this guy is gonna build this domain in the Bronx right now, because he's got a big steel door, and none of the welding torches, none of the boomerangs, nothing we have is gonna blast our way in there. Sure, we want those new steel doors ourselves, to protect our banks, to protect the American trade secrets, patent rights, technology. But do we want a digital superhighway where major criminals can operate impervious to the legal process? If we don't want that, then we have to look at Clipper."

Kallstrom, along with Baker, Brooks, McConnell, and the CIA's John Deutch, became part of the key escrow team ostensibly briefing the administration on its options, but really steering it, with one hand on the scruff of its Democratic neck, toward an inevitable embrace of Clipper. One unexpectedly ally was commerce secretary Ron Brown; in the first briefing he attended, Brown mentioned that his army days had been spent at an NSA listening post, and he was fully aware of the vital importance of signals intelligence. By now the briefings included not only national security people but the Clinton-Gore science staffers like the Office of Science and Technology Policy's Mike Nelson, infonauts well attuned to issues like personal privacy and the industry's need for secure systems. (Nelson got his top-secret clearance in a lightning-quick three weeks.) In a January 26 FBI briefing, Kallstrom laid out a lot of the fine points of the scheme, but Gore's senior director on intelligence programs, George Tenet, had further questions on the Clipper methodology. Who would be the key escrow agents? How would the international aspects be handled? A lengthy February 9 memo from Judge Sessions gave a detailed summary of the plan and the dire implications that would ensue if no action was taken.

So, barely a month into the Clinton administration, the pressure was intense to move on Clipper. Supposedly, AT&T would ship ten thousand DES-equipped phone devices by April 1 if no action was taken. But by then, the administration's crypto team—consisting of national security people and Internet specialists—had almost imperceptibly shifted from decision making to implementation. It was their first big initiative, and they wanted it done fast: the word "closure" kept popping up in their correspondence.

A typical internal memo, dated March 5, was from George Tenet to Gore's national security advisor Leon Fuerth and his colleague William Wise: the header read "HELP HELP HELP." Then, "Desperately need time from the VP"—for a meeting with the past and current NSA directors on the encryption issue. "I think I know what the VP wants to hear McConnell/Studeman talk about," Tenet continued, finishing with the odd closing, "God bless you all."

All through March, the meetings continued. Meanwhile, industry and civil liberties groups were lobbying the newcomers, still hoping that the new administration would be amenable to considerable reform on crypto. "You're holding back e-commerce, you're endangering the security network, and besides, it's all out of control, anyway!" one of them shouted at Gore's people. But the Clinton people had already mentally aligned themselves with the government insiders at the NSA, the FBI, the Justice Department, and the CIA. The classified briefings had done the trick, particularly the warning that if no action was taken, people will die. Are you willing to sacrifice human lives, they were asked, for a fraction of a decimal point rise in the GNP? The tack was devastatingly effective: the dilemma was essentially resolved by framing it as a choice between thousands of people dying and Bill Gates being 10 percent richer. "That's a pretty easy decision," says an administration official.

Not that there weren't qualms within the White House. The biggest question the Clinton aides asked themselves was, "Why would anyone want Clipper?" (After all, the plan was supposed to be voluntary.) Another problem was the requirement that the Skipjack algorithm remain under wraps. It was inevitable that its secrecy would lead critics to charge that the scheme was a Trojan horse to bring flawed crypto into the infrastructure. But the NSA wouldn't budge on secrecy.

Finally, there was the problem of how the key escrow scheme would play overseas. If a crypto solution was not global, it would be useless. If buyers abroad did not trust U.S. products with the escrow scheme, they would eschew those products and buy instead from manufacturers in Switzerland, Germany, or even Russia. And how could you handle key escrow in other countries? Should the United States allow access to stored keys to free-speech–challenged nations like Singapore, or China? And would France, Egypt, Japan, and other countries be happy to let their citizens use products that allowed spooks in the United States to decipher conversations but not their own law enforcement and intelligence agencies? The answers to those questions were not forthcoming because the planners of Clipper never did work out a solution to its global implications—another consequence that came with rushing Clipper out of the door.

None of those objections were sufficient to sink the plan. At six in the evening on March 31, 1993, in the White House Situation Room, Vice President Gore went over the proposed directives in a meeting that included the whole gamut of law enforcement, intelligence, and national security leaders. Not long afterward, he briefed the president with his recommendation. Bill Clinton agreed.

Clipper was a go.

From that point the operation shifted to what one participant calls "White House Marketing." Press releases were drafted. Mike Nelson set about writing an explanation of the proposal in question-andanswer form. Then on the eve of the announcement itself, the White House prebriefed a number of representatives from Congress, industry, and the civil liberties groups on the issue, not so much to collect feedback as to forestall charges that the Clinton people had blindsided them with the abrupt change in course.

Still, no one at the White House anticipated a major clamor over Clipper. But Clint Brooks saw trouble coming—this issue had the potential to leak outside the Beltway, to make real enemies out of potential sympathizers. They just don't get it, he complained to Stew Baker on one drive between Fort Meade and the White House. At one meeting, he asked, "Who's going to handle this on Larry King Live?" His question was ignored. A few minutes later, he repeated it. A senior administration official sternly told him, "Clint, we appreciate your sense of humor but this is really serious—you handle the technical stuff and we'll handle the political stuff." (Some months later, when Al Gore appeared on Larry King Live to talk about the Information Highway, the first question posed to him was about . . . the Clipper Chip.)

The briefings with Congress and industry went pretty much as expected: the proposal was received cautiously, even skeptically, but not dismissed out of hand. One legislative staffer complained that when the Clinton people were challenged, they went on the offensive. "Do you want to be responsible for kidnappers?" the Clintonistas would ask, and the legislators would crumble. The sessions with civil liberties groups weren't so cordial. John Perry Barlow of the Electronic Frontier Foundation got one of these last-minute briefings and couldn't believe his ears. He felt that his new friends in the White House had

the Electronic Frontier Foundation got one of those last-minute briefings and couldn't believe his ears. He felt that his new friends in the White House had been "drinking the Kool-Aid," a national security version of Jonestown. What particularly offended him was Mike Nelson's invocation of the classified information he had heard and Barlow had not. "If only I could tell you what I know, you'd feel the same way I do," Nelson said. Thousands could die, he confided. Barlow felt he was hearing the same phony music that had been sung by the Vietnam warmongers. What Clipper really represented, he felt, was a plan that would "initiate a process that might end freedom in America."

Then there was Clint Brooks's effort to get outside experts the information necessary to explain the benign nature of the system to the public. The night before the announcement, Brooks himself ventured through a driving rain to brief Georgetown computer science professor Dorothy Denning, his first choice to lead the panel to vet the classified Skipjack algorithm. It would be an inspired choice. Denning was an expert on crypto and computer security but her demeanor was as benign as Betty Crocker's. (Science fiction writer Bruce Sterling once described the diminutive woman as "something like a Pilgrim maiden behind leaden glass.") She was already on the record as supporting the regulation of cryptography, and coincidentally at the time of Brooks's visit had just experienced an awkward situation in which she'd been unable to get into her locker after a swim in the university's indoor pool; only helpful maintenance men with heavy-duty cutters (the equivalent of escrow agents!) saved her from venturing into forty-degree weather in her wet bathing suit. Not only was she ready to defend key escrow, she came to feel it was her destiny.

On April 16, President Clinton unveiled the new initiative. In his press secretary's announcement of the plan, the issue was presented to the public as a middle ground between two dreadful extremes—much as the situation had been presented to the administration by the NSA. Seen through that filter, the Clipper Chip was to be regarded as a godsend:

The chip is an important step in addressing the problem of encryption's dual-edged sword: encryption helps the privacy of individuals and industry, but it can also shield criminals and terrorists. We need the "Clipper Chip" and other approaches that can both provide law-abiding citizens with access to the encryption they need and prevent criminals from using it to hide their illegal activities.

> The actual announcement did not establish Clipper as a standard, but it did affirm that the government itself was committed to buying thousands of the AT&T Clipper-inside devices for its own agencies. The hope was that while Clipper was designed to be a voluntary standard, its adoption and endorsement by the government would tip the marketplace to make it ubiquitous. The ultimate recommendation would come after Clinton received the results of a widespread blue-ribbon review on the national crypto policy that would look at the escrow initiative and reevaluate the export laws.

With that announcement, Bill Clinton and his people felt that they had made a big step toward avoiding what seemed like a disastrous collision in the crypto world, one that had seemed predestined since the day that Whit Diffie figured out how to split the cryptographic key. In fact, the Clipper Chip did mark the turning point in the battle, but not at all in the way the Clinton administration had intended. By promoting Clipper as its key escrow flagship, the government profoundly erred. Instead of a nuanced debate on encryption, from that point on the merits—and drawbacks—of this particular scheme would become the main crypto battleground. Clipper itself was the issue, and Clipper as proposed was vulnerable. And Clint Brooks, who was more than anyone its architect, saw what was happening, but was powerless to prevent it.

At first, things didn't look so bad. From the vantage point of the White House and Fort Meade, it appeared that what relatively little public attention the Clipper Chip had garnered was fairly balanced. The New York Times article, published on the day of the announcement, had set a reasonable tone, right from its lead. The Clinton administration was "about to announce a plan to preserve privacy in electronic communications . . . while also insuring the government's right to eavesdrop for law enforcement and national security reasons." Balance. Of course, the article did quote one industry representative as saying, "The government is creating a monster."

In the days following, there was no rush to embrace the plan by the various stakeholders who might be affected by it. The feds took succor, though, in the lack of a widespread outcry against it. The Internet, of course, was buzzing with fears of police-state tactics, but on the other hand, Dorothy Denning had almost immediately posted a clear-headed description of the system itself and was already serving as an example that the crypto community was not universally anti-Clipper. Better yet, an unexpectedly friendly description of the plan came from Marty Hellman, whom Brooks had briefed by phone on the eve of the announcement. Hellman's explanation of the scheme was cautiously neutral (though he did warn that there should be safeguards in the legal process leading to key retrieval), and was posted on the influential "Interesting People" mailing list run by Net gadfly David Farber.

On April 20, Clint Brooks wrote a memo reflecting his optimism. "The reactions I am getting from academic and industry people is that this may succeed," he wrote. So much so, these people were telling him, that the government may have not allocated enough digits in the chip identification fields to handle all the Clippers that would come into use. A hundred million would not be enough!

But that initial success was illusory, like a second-rate baseball team sitting in first place after a lucky string of April wins. The first serious rumbles came from the crucial information industries. After going over the plan, they concluded that the opportunity it offered to build strong exportable crypto into their systems was more than canceled out by the presence of the Law Enforcement Access Field, which provided keys to government snoops with warrants. The point of exporting crypto, after all, was to serve customers overseas. But what foreign companies wanted to buy a security system where the keys were stored in United States government escrow facilities? The business leaders joined with the already skeptical civil liberties people and fed on the energy of the grassroots Internet folk, who'd hated it from the get-go. Then they all took their case to the media. Though the reaction took a few months to build, the Clipper coverage eventually exceeded all the publicity that any previous cryptological development had ever received.

Little of it was favorable. All the time the government was planning its key escrow initiative, its creators had implicitly believed that only an isolated few would question their motives. They saw the selling of Clipper as a process by which responsible people would have a number of concerns, and the government would respond to those. One prime concern, they figured, would be a fear that the mechanics of the escrow scheme would somehow compromise the security of the encryption itself, making it easier for crooks and spies from other countries to do the unscrambling. Another would be that the key escrow facilities themselves might be vulnerable. What this thinking didn't account for was that the very basis for the scheme—a government means by which to flip the "descramble" switch for its own purposes—was offensive to most people. All opponents had to do was use a simple analogy—What if you had to leave a copy of your front door key at the police station?—and even a Joe Sixpack who didn't know encryption from a forward pass would be an anti-Clipper convert. "The idea that government holds the keys to all our locks, even before anyone has been accused of committing a crime, doesn't parse with the public," explained Jerry Berman of the EFF. "It's not America."

Others didn't need such analogies. One of the basic reasons many people wanted to use crypto was to keep information from the government itself. Not that they were necessarily lawbreakers. They simply didn't trust the government. The bureaucrats who made the plan were a generation removed from Watergate, but anyone who had been around in the seventies might have known better.

Former NSA director Bobby Inman, for instance, got an early briefing on the Clipper Chip and he sensed right away that it was doomed. Who wanted to give

the government a direct pipeline to your information? The cypherpunks understood this, and immediately initiated a guerrilla campaign to infect the media and the general population with the anti-Clipper message. At their monthly meeting, Eric Hughes solicited an agenda of possible actions including everything from advocacy press kits to stumping for a procrypto constitutional amendment. Tim May suggested active sabotage of Clipper, or a boycott of AT&T. One effective prank they did pull off was distributing a little decal to stick on your laptop. Designed to resemble the famous Intel Inside logo, it read, "Big Brother Inside." That pretty much said it all. (Intel quickly threatened to sue for trademark infringement, and the offending cypherpunks stopped distributing the stickers.)

Opposition came from all quarters. The ACLU found itself agreeing with Rush Limbaugh, who attacked Clipper on his radio show. Digital hippies savored the William Safire column "Sink the Clipper Chip," where he noted that the solution's name was well chosen, "as it clips the wings of individual liberty." Tim May often expounded a theory that Americans are of two minds when it comes to privacy. One involves the public interest and was essentially anticrypto: "What do you have to hide?" The other expresses the individual ethic of the Bill of Rights, and is proprivacy: "None of your business." Any successful policy has to walk down the middle of those opposing sentiments. But Clipper, in its insistence that nothing should be hidden from the government, never established that balance. Once people began calling it the Big Brother Chip, the game was over.

The government did its best to defend the scheme. Stewart Baker briefed industry figures including crypto advocate Bill Gates, to little avail. He went into the lion's den, speaking at procrypto events like the Computers, Freedom, and Privacy conference—where he belittled the anti-Clipper forces to their faces, calling their actions, "the revenge of people who couldn't go to Woodstock because they had too much trig homework." He taunted them with the "If you knew what I know" argument. Your view of privacy, he told them, reflects a hopelessly naive view of the world. "By insisting on having a claim to privacy that is beyond social regulation, we are creating a world in which [crooks and terrorists] will flourish and be able to do more than they can do today," Baker warned.

Not all the news was bad for the government. In the summer of 1993, the Skipjack algorithm was deemed strong by the team of "independent experts" led by Dorothy Denning and including Walt Tuchman (who had led IBM's DES team) and Ernie Brickell (who had picked up the $1000 reward for cracking Merkle's multi-iteration knapsack cipher). Denning had become so fierce in her defense of the government, clearly articulating a position that posited the dangers of crypto anarchy, that critics were calling her "Clipper Chick." Her disinterested status made her more effective in public forums than the administration's battered tech squad, which was beginning to regard its appearances at Internet-related conferences with all the enthusiasm of dental surgery. Who could blame them, as question after question drilled in the reality that their natural constituency of tech-savvy "Netizens" now saw them as virtual brownshirts? The White House's Mike Nelson came to refer to crypto as "the Bosnia of telecommunications."

Still, Clipper seemed cursed. At every turn a new problem cropped up. For example, not long after the announcement of the plan, the government heard from an MIT professor named Silvio Micali. Micali, who worked in MIT's mathematics and cryptography group (led by Ron Rivest), had devised some mathematical protocols he called "Fair Cryptosystems" that seemed similar to the government's key escrow scheme. He had published a paper on them in 1992 and had gotten a patent for them. The government quietly paid Micali a million dollars to license his patent.

Even the chip's name proved to be a problem. "Clipper was our cover name, a la NSA normal operations," Brooks wrote in an early 1992 memo. "I tried to get people not to use this outside the agency, but the policy makers and their staffs found it so convenient to use that it stuck." Unfortunately, a company named Intergraph was already selling a microprocessor it called Clipper, and the United States had to pay a considerable sum to buy the rights to a moniker that was well on its way to what marketers call a brand disaster.

Other problems were purely technical. The chipmaker Mykotronx was a government and commercial contractor unaccustomed to the demands of the consumer marketplace, and its chip wasn't built to accommodate high-bandwidth data rates. In its haste to get the Clipper Chip into the AT&T phones, the NSA had created a product that might have been adequate for the communications technology of 1993 but was woefully inefficient for the high speed of information flow in the glistening future that would arrive, oh, two years or so later. In other words, as critics noted with withering irony, by the time a security company took the fifteen to eighteen months to build a product around Clipper, the hardware would be obsolete.

Did anyone like Clipper? As part of the process, NIST had been required to solicit public comment on the plan. Three hundred and twenty individuals and organizations responded; of those, only two agreed with Clipper. "This is not a Hall of Fame batting average," conceded NIST official Lynn McNulty. But the Clinton people would not budge. On February 4, 1994, the president formally endorsed Clipper —known as the Escrow Encryption Standard—as a Federal Information Processing Standard. The government would immediately start buying Clipper-equipped AT&T phones for its own use, escrowing keys with NIST and the Treasury Department. (This despite the fact that the technology did not yet actually exist to perform decryption of keys retrieved from the as-yet-nonexistent escrow facilities.)

"The War is upon us," wrote Tim May. "Clinton and Gore folks have shown themselves to be enthusiastic supporters of Big Brother."

In the Senate, Patrick Leahy, among others, vowed to fight Clipper, insisting that without congressional approval the project could not be funded (setting up the program would cost $14 million, with an annual $16 million budgeted for the escrow facilities). In May 1994 he held hearings. In rare public appearances, Clint Brooks and Mike McConnell presented the view from behind the Triple Fence, essentially congratulating the administration for taking the right approach. "There are, to be sure, issues to be ironed out," concluded McConnell. "But I am confident we will work out the wrinkles."

Then a panel of opponents showed those "wrinkles" to be approximately the size of the Colorado River basin.

One tough question they posed: Who would want to use Clipper, when there were already programs like PGP readily available? The government's response had been the "stupid crook theory," best explained by the FBI's Jim Kallstrom, who professed to have himself heard mobsters on wiretaps make jokes about being wiretapped—and then engage in incriminating conversations, simply because it was too awkward to go outside and use a pay phone. "If in five years this catches on and people put Clipper in their devices, a high percentage of criminals will go to a Radio Shack or some other place like that to buy some sort of encryptor," he said. "They're not going to remember that in 1994 some article [appeared] in the Wall Street Journal [about key escrow]. Maybe in the fine print somewhere it'll say Clipper something. But it's not going to be readily apparent—it'll be part of the landscape. That's what would be our desire."

OK, so stupid crooks might use it. But the antigovernment witnesses noted that if smart criminals eschewed Clipper, so would the overseas customers who were crucial to its adoption. What was in it for France or Japan or Indonesia to sign on to a plan where the keys to their citizen's private conversations—possibly involving invaluable business secrets—were held jointly by two branches of the United States government?

Perhaps the most persuasive witness was Whit Diffie. He testified not only as one of the inventors of public key but as a representative of one of the ad hoc organizations lobbying against Clipper, the Digital Privacy and Security Working Group. Diffie tried to put the issue into historical perspective. Governments had been similarly concerned with previous revolutions in telecommunications, like the transatlantic cable and the advent of radio. Despite fears that governments would lose sovereignty, these developments turned out to prove tremendously useful to governments. Computer communications, too, would probably, on the whole, increase government power. But the United States seemed loath to allow any of that power to accrue to its citizens. While

too, would probably, on the whole, increase government power. But the United States seemed loath to allow any of that power to accrue to its citizens. While the government claimed only the desire to retain its current ability to wiretap, the fact was that during the time of the founding fathers, privacy was easily obtained simply by walking out of the earshot of others. "It seems that the right . . . of the participants to take measures to guarantee the right to speak privately can hardly have been in doubt, despite the fact that the right to speak privately could be abused in the service of a crime," said Diffie. Today, of course, people communicate largely by electronic means, from the telephone to the computer. Could it be that the government has the right to deny the possibility of privacy in those conversations? "The legitimacy of laws in a democracy grows out of the democratic process," Diffie told the senators. "Unless the people are free to discuss the issues—and privacy is an essential component of many of those discussions—that process cannot take place."

Not long after the Senate hearings, Clipper suffered perhaps the worst blow of all. It came not as a tirade in Congress, an attack by an industry representative, or a screed from a cypherpunk. It was the result of a scientific experiment conducted by a formerly obscure research scientist named Matthew Blaze. Essentially, he made the Clipper Chip look stupid.

Blaze was a New York kid, a classic science nerd. He'd dropped out of a preppy private school, worked for a while as a paramedic (the first person hired by the city's emergency medical service without a driver's license), then drifted back to college, earning a degree in two seemingly incompatible sciences: computer and political. At graduate school at Columbia, he began seriously thinking about crypto. Talking to his officemate, a guy named Stuart Haber, who had devised a way to use public key to time-stamp documents digitally (providing an electronic equivalent to the old trick of postmarking a letter to affirm its age), he realized that crypto was both a way to tackle important mathematical problems and a practical lever to change society. Blaze was also a big believer in privacy rights.

After switching to Princeton and getting a Ph.D., he went to work for the small crypto group at AT&T's Bell Labs research facility. Blaze began working in areas of encryption other than algorithms. His group was more concerned with basic research than AT&T's secure system group in North Carolina, which had produced the TSD 3600 device that was slated to be the Clipper phone. In fact, he found out about Clipper by reading the newspaper like everyone else.

But as the Clinton administration was readying its February 1994 endorsement of the escrow standard, it had initiated a series of technical briefings that included the Bell Labs crypto group. Several NSA scientists came to New Jersey for a briefing. Though the group could generally be described as anti- Clipper—besides the privacy implications, as cryptographers they were offended at the security risks of sending a key to a third party—"we managed to be on our best behavior," says Blaze, "not letting the meeting degenerate into whether this is a good idea." Afterward, he asked if he could post a summary of the meeting to the Internet, and Blaze stuck to the facts in that as well.

This impressed people behind the Triple Fence, who apparently thought Blaze could be another valuable outside tester of Clipper technology. They invited him and a colleague to Fort Meade to get a prototype of Tessera, the smart-card-based version of the escrow system. (Tessera was to be a portable version of the whole-enchilada Capstone cryptosystem that Clint Brooks favored over the limited Clipper Chip.) Never having been there, Blaze was excited. He was given the standard visitor's badge with a sensor that tracked him through the building: when his host took him through he had to keep facing security cameras and assuring some unseen guard that Blaze was with him, and a disembodied voice said, "Okay, thank you." Even between the briefing room and the bathroom this happened a couple of times. "They didn't actually follow me into the bathroom," Blaze says. When the Bell researchers left, they were given Tessera cards, a stack of manuals, and NSA coffee mugs.

Blaze immediately began testing the system, focusing on the Clipper aspects of the device. Unlike Dorothy Denning's team, which had focused on Skipjack, Blaze wondered whether there was a way to actually use the strong encryption while defeating the escrow feature. In other words, could a crook, terrorist, or someone just wanting privacy use Clipper's crypto without being identified? He focused his efforts on studying the Law Enforcement Access Field. "I wasn't even thinking of it as a potential weakness," he says. "But it turned out that the obvious way of defeating the LEAF was pretty much the first thing you would initially think of."

Using a card reader and a little program that simulated a wiretap, he began testing. The simplest things —altering the code so you wouldn't send the identifier, or sending some other number in place of the identifier—didn't work. But it took only a bit of thought to come up with slightly more complicated ways that did work. The breakthrough came when Blaze, poring over the manuals, noted that the "checksum" in the LEAF was only 16 bits long. (The checksum is the way to verify that the proper LEAF, including the chip identifier and session key that encoded the conversation, was indeed sent off to the authorities. The proper number in the checksum is like an "all's clear" that says everything is OK. If there was some way of creating a counterfeit LEAF with a legitimate checksum, in effect you would have defeated the Clipper system. The encryption would work, but the wiretappers wouldn't have the proper session key to decrypt the conversation.)

"Sixteen bits isn't a very big number these days, computationally," Blaze says. Within a few hours he hacked up a "LEAF-blower," a quick program that could send out every possible combination (2 to the 16th power) of checksum numbers, then hooked it to his test system. He really didn't expect it to work—it seemed so easy. But it did work, each time he tried it. In no more than forty-two minutes, he was able to send out a checksum that spoofed the escrow system into mistakenly assuming he was sending out the data that could lead investigators to the escrowed key—when in fact that data would lead them nowhere. Instead, the wiretapper would be faced with a conversation encrypted by the powerful Skipjack algorithm, deemed uncrackable by the NSA itself. (He also found a way in which two people conspiring to defeat the LEAF system could do so even more quickly.)

What Blaze did not know was that the small checksum space was no accident but an artifact of the haste with which Clipper was prepared. During the hurried design process the NSA engineers consulted with various technical experts at telephone companies, and were warned that with wireless phones, any system that required transmission of too many bits would be deemed impractical. So the LEAF field was limited to 128 bits. Of that, 32 bits had to be used for the chip identifiers, leaving only 96 bits for an actual encryption key and the checksum. The NSA wanted a large checksum, but the FBI insisted on using 80 bits so the full session key would be transmitted. (An alternative may have been to leave off some of the key bits and allow the FBI to complete the decoding by a brute-force attack. If, for instance, eight bits had been diverted from the keyspace to the checksum, the FBI could have run through a mere 256 different alternatives to find its key—but Blaze's attempt to crack the checksum would have taken not 42 minutes, but more than a week. That's a long time on hold.)

In a few days, Blaze sent a draft paper of his findings to his colleagues at Bell Labs. Most of them couldn't believe it. "Are you sure about this?" they asked, suggesting he recheck his work. He did. Then he began the more delicate process of checking it with outsiders. One morning Blaze girded himself and sent a fax of his draft to Fort Meade. Right after lunch he got a call back, affirming his results were technically correct.

"What are you planning on doing with this?" asked his NSA contact.

Blaze took a deep breath. "I'd like to publish it."

To his surprise, no objection was raised. His NSA reader did point out a couple of errors in numerical transcription and one grammatical error. Now all Blaze

had to do was get an okay from his employer— who had millions of dollars riding on its Clipper phones. Though there were some who wanted to bury the paper, eventually Blaze managed to convince his bosses that it would be impossible to keep his findings secret, so they shouldn't even try. In any case, John Markoff of the New York Times had already gotten wind of the work. Blaze got permission to send him a draft, so that whatever story ran would be accurate. Markoff called back for some clarification and a few hours later called back again and asked Blaze a strange question: how newsworthy did he consider the story? Blaze felt that it was indeed a story —it showed how rushed the NSA was to get its system out, and emphasized how dangerous it was to foist something half baked on the public—but not a front-page story or anything like that. Not long afterward, Markoff called again, almost apologetically, and said that it had been a slow news day so the story was going to be more prominently placed. Blaze figured that meant it would lead the business section.

He'd heard that you could get the next day's paper at 9 P.M. if you went to the Times Building, and he was curious enough to do so. After opening the paper, he went through it and was disappointed to find nothing. "It hadn't occurred to me to even look on the front page until I had gotten out of the building." But there it was—leading the entire paper on the sweet spot in the rightmost column of page one, headlined "FLAW DISCOVERED IN FEDERAL PLAN FOR WIRETAPPING."

This was significant in several ways. First, though the flaw itself could be fixed—and arguably didn't compromise security much—the very fact that such a weakness existed put a permanent taint on a system dependent on public trust. But perhaps more important was that the former backwater, mumbo-jumbo subject of crypto had raised its profile so high that even a moderate development like Blaze's crack could be seen by the Times editors as the most important story in the world that day. What made this dry topic sexy was the whiff of a Big Brother who couldn't even program correctly. The government unintentionally played into that role when an imperious NSA official insisted that Blaze's attack, while feasible, was unlikely in practice—not a particularly comforting assurance for the nation's cryptographic caretaker. Much stronger was Marty Hellman's assertion, "The government is fighting an uphill battle."

Meanwhile, after some initial supply problems, the government was already starting to use Clipper phones. (The more comprehensive Capstone chips, designed to escrow computer communications, were late in entering the pipeline.) Approximately once a week, four couriers with security clearance—two each from NIST and the Treasury Department—flew from Washington, D.C., to Torrance, California, to the so-called programming facility at Mykotronx headquarters. (The redundancy was intentional, conforming to the Two-Person Integrity Protocol also used for nuclear weapon controls.) Once inside they waited while a Sun workstation did its work, first generating the unique cryptographic keys that would be blown into the MYK-78 (Clipper) chips, then splitting the keys into two parts and creating two stacks of floppy disks, each one with a set of partial keys. To reconstruct the full keys inside the chips required both sets of disks.

Backup sets were produced by the same method. Then the disks were separated, each one going with a pair of couriers. A plastic seal went over the disks. When the couriers returned to their respective agencies, the disks were placed in double-walled safes meeting government standards for classified materials. A set of the backups went in another safe. And there they waited, about 20,000 key splits by May 1994, sitting undisturbed while the war over Clipper continued.

In late January 1994, the Computer Professionals for Social Responsibility had written a letter to the president urging that he rescind the Clipper proposal. It was cosigned by privacy experts, industry figures, academics, and cryptographers, and supplemented by signatures gathered over the Internet. Within a few months, the petition—one of the first Internet political protests—boasted over 47,000 endorsers. While a skeptic might dismiss this as a result of overheated Net-heads, a New York Times/CNN poll showed that the government had clearly suffered a Custer-sized rout in the public relations arena. Eighty percent of the American public now opposed Clipper.

Not that it did any good. The administration was betting that the export regulations would prevent strong crypto from being built into products that people routinely used, and key escrow would be the only game in town. But Congress had the power to change those regulations. And pushing hardest on the issue was a thirty-eight-year-old single woman in her first term in Congress.

Maria Cantwell was a daughter of an Indiana politician. She'd moved to Washington State in her twenties, served in the legislature there, and in 1992 pulled off a successful run for the House. Her district, consisting of part of Seattle and the towns east of Lake Washington, was loaded with high-tech companies, from Nintendo to Microsoft. So when choosing a committee to serve on she focused on one of the software industry's main concerns, exports, and requested the Foreign Affairs Committee— specifically, its subcommittee on economic policy, trade, and environment.

She'd hardly gotten familiar enough with the House to find the cloakroom when the Clipper announcement hit. It infuriated her big high-tech constituents, and she began to look more deeply into the problem, particularly at the export regulations. She worked closely with the affected software companies, not only those in her district like Microsoft but others like Lotus. The more she learned about the export regulations of crypto, the more absurd they seemed in the computer age. They can't be so myopic to think cryptography is a munition, she'd say to Sam Gejdenson, the subcommittee chair and one of her legislative mentors. If they continue, you won't be able to get protection on the Internet.

Meanwhile, the export situation was at a standstill. In 1992, some of the leaders of the new industry, like Lotus's Ray Ozzie and Microsoft's Nathan Myhrvold, had spent an incredible amount of energy negotiating a deal with the NSA. The talks were a classic culture clash. The software guys thought it absurd that government was attempting to contain bits of code within national borders, when algorithms with the same ciphers were openly published in countries from Germany to Russia. It was the worst sin among nerds: illogical behavior. Or was it? "Don't you realize," Myhrvold once asked one of the spooks in a briefing session, "that you're like the little Dutch boy, trying to use your fingers to plug the dike against a sea of strong crypto?"

His tormentor smiled. "Every day the dike doesn't break," he said softly, "is a victory." And it was true. Sure, the crypto genie had escaped the bottle. But if you throw enough obstacles in the genie's way, it'll take him a long time to perform any magic.

Finally, all that energy resulted in a temporary compromise. Working with an industry group called the Software Publishers Association, the companies got an agreement for "expedited consideration" when they exported software programs sold in shrink-wrap to retail customers. The requirement was that the encryption in those products would be Ron Rivest's ciphers RC-2 or RC-4, using keys of no more than 40 bits. This would allegedly be increased in subsequent years to keep pace with faster computers. In exchange, the NSA got some restrictions of its own. The regulation would not be formalized in an explicit standard. RSA and the companies using the cipher had to agree to keep the details of its design a secret.

But no one particularly liked that deal. Companies had two choices. They could, like Lotus, offer American customers a version with strong (64-bit) encryption, and a weaker version for export. Then foreign customers would wonder why their software had second-class crypto—and sometimes, buy other products. Ray Ozzie claimed that it was already happening with Lotus. (He called the 40-bit limit espionage-enabled encryption.) Or, like Microsoft, they could avoid the hassle of manufacturing and shipping two versions and give everyone weak encryption. Meanwhile, hard-liners in the government felt that by green-lighting an export exemption, no matter what the key length, they were on a slippery slope toward strong crypto. Give the Lotuses and the Microsofts 40 bits now, and tomorrow they're at your door demanding 48 bits, and more.

But when Cantwell and Gejdenson went to the White House to urge movement toward export of stronger crypto, they hit a brick wall. The Clinton people held firm.

In October 1993 Gejdenson and Cantwell held a subcommittee hearing to draw attention to the problem. "This hearing is about the well-intentioned attempts of the National Security Agency to control that which is uncontrollable," said Gejdenson. He was talking about export regulations, but he might have been talking about something else—the support from Congress that Fort Meade once took for granted. While the majority of legislators accepted the NSA's contentions at face value, a cognitive dissonance was emerging between its arguments and what appeared to be a more compelling view of reality. Cantwell put it clearly in her own opening statement: "We are here to discuss, really, competing visions of the future." On one hand was a mind-set so locked into Cold War posturing that it ignored the inevitable. On the other were the techno-visionaries who powered our future, eager to fortify American ascendancy in a global marketplace.

The hearing's first witness was Ray Ozzie, who had come prepared with a software demo. He had a screen connected by phone line to his computer in Massachusetts, which he used to venture onto the Internet and download one of "hundreds of thousands" of copies of implementations of DES available overseas. He chose one in German, and downloaded it into his machine within seconds, as anyone in the world could do. But, he noted, if he were then to send the same software back to Germany, he would be guilty of the federal offense of exporting strong crypto.

Next was Steve Walker, a former NSA official who now headed Trusted Information Systems, a consulting firm helping businesses implement crypto. He presented the results of a Software Publishers Association study that identified 264 cryptographic products produced overseas, 123 of which employed DES. Foreign individuals and companies could buy any of these, but not similar products created by American firms because the NSA would not permit their export. "It cannot be clearer," he said. "The existence of widespread and affordable cryptographic products overseas is an indisputable fact . . . the U.S. government is succeeding only in crippling a vital American industry's exporting ability." He then cited specific examples of business lost by American companies, like one firm that lost half of its European customers because it could not provide them strong cryptographic security.

Phil Zimmermann gave testimony that trying to restrict cryptography is like attempting to "regulate the tides and the weather." Don Harbert, an executive of Digital Equipment Corporation, insisted that "U.S. export controls on encryption must be brought into line with reality."

One of the committee members who had not been previously vocal in challenging the government, a conservative Californian named Dana Rohrbacher, noted for the record that if it were five years earlier, he would have chastised the witnesses for seeking profit at the potential loss of national security. But now, he said, "the Cold War is over. It is time for us to get on."

After the public session, security experts swept the room for bugs before the inevitable follow-up hearings involving the interests of the National Security Agency: The Briefing, "where the NSA answers all those questions in secret," said Gejdenson. NSA briefings were notorious in Congress. They involved a dramatic presentation by the NSA on why our international eavesdropping abilities were so vital, typically including a litany of victories achieved by clandestine snooping (victories that would have been unthinkable without billions of dollars in funding), and perilous international situations that required continued vigilance and support. Perfected by Bobby Ray Inman in his days as NSA director, they initiated legislators into the society of Top Secret, implicitly shifting their alliance from the citizenry to the intelligence agencies. A newly cleared congressperson would get a presumably unvarnished and reportedly terrifying dose of global reality, after which he or she thereafter could be assumed to dutifully support any demands of the National Security Agency, lest the Huns gain a purchase on our liberty. Representatives and senators had been known to venture into the bug-swept room and emerge grim faced, stunning their go-go staffers by remarking, "Well, maybe we should reconsider."

Not Maria Cantwell. She was among a growing number of legislators who found The Briefing impressive but not persuasive. The issue for these skeptics wasn't just how important crypto was, or what successes we'd had breaking codes, but whether maintaining export rules was actually productive. If the genie was out of the bottle, so what if American companies couldn't export? Crooks would get crypto elsewhere!

Cantwell began to prepare a legislative remedy. In 1994 the Foreign Affairs Committee was already planning its periodic overhaul of the export regulations. She prepared H.R. 3627, "Legislation to Amend the Export Administration Act of 1979," a bill adding a new subsection to the old rules, with specific implications for software exports, including encryption. It would move the decision-making process from the Department of Defense to Commerce, and would essentially make shrink-wrapped or public-domain software exempt from export regulations. It would put an end to the NSA's game of controlling American crypto by use of the export laws.

Naturally, the administration could not let that stand. When Cantwell was ready to introduce the bill, her staff notified her of an incoming phone call—from the vice president. The only previous time she had engaged Al Gore in a one-on-one had been during the budget battle, when Cantwell, despite severe reservations, had supported the administration (and would eventually wind up losing her reelection campaign in part because of it). What did he want this time?

"I want you to stop this bill," he said. He reiterated the stuff from the briefings about national security and all that.

Cantwell held firm. "I'm sorry, Mr. Vice President," she said. "I respect your opinion but I'm not changing my mind."

In a way, that was a turning point for Maria Cantwell. She got the bill through the subcommittee and kept pressing, even though fellow committee members were already trying to get her to drop the thing. Even before she left the hearing room after the vote—she hadn't even gotten up from her chair—one representative came up to her and said outright, "If you don't stop this it's going to get very ugly." And Maria Cantwell said to herself, "I'm not stopping."

On November 24, 1993, Cantwell introduced H.R. 3627 on the House floor. Her comments were blunt. "The United States' export control system is broken," she said. "It was designed as a tool of the Cold War, to help fight against enemies that no longer exist. The myriad federal agencies responsible for controlling the flow of exports from our country must have a new charter, recognizing today's realities."

The pressure continued, though most members were collegial in their attempts at persuasion. There was one instance in which a fellow Democrat came up to her on the floor and began berating her for ignoring national security issues. She felt intimidated but more than ever was convinced she should go on. With all the forces lined up to bolster these bizarre export laws and the silly Clipper Chip, it struck her as an exercise in unchecked power—against consumers.

Still, she knew that on this issue she was out there. Though she was doing yeoman service for the techies she represented, most of her constituents in Washington State's First Congressional District preferred her to be concentrating on issues such as health care, and here she was, locked in meetings with National Security Advisor Tony Lake. One day she heard that Bill Gates would be in town. So she asked the people at Microsoft who had been working with her—Nathan Myhrvold and company counsel Bill Neukom—if they could convince the world's most famous techno-geek to lobby her colleagues on the matter. I'm out on a political limb here, she pleaded. Without publicity, she had Bill Gates address the intelligence committee. The National Security stooges

matter. I'm out on a political limb here, she pleaded. Without publicity, she had Bill Gates address the intelligence committee. The National Security Stooges started to explain to the billionaire how important the export laws were, but the icon of the New Economy had little patience for being lectured. Gates let them know that was a bullshit reason. The committee members didn't get offended—it was kind of a kick, getting snapped at by the world's richest guy. You certainly had to take him seriously when he talked about what was good for business.

Cantwell dug in her heels with the White House, too. She asked them not to fight her bill, but to let it take its course in Congress. The response was unexpected, and it came two days before the vote. It was a deal. If we change our position, the Gore people wanted to know, would you drop the bill? They suggested that instead of forcing the Clipper Chip on people, they would instead advocate a different voluntary key escrow scheme. And maybe it could be based on more flexible software implementations than that already antiquated chip. And maybe, instead of only government escrow facilities, some could be in the more-trusted private sector, like banks or security companies.

A significant retreat, but it was still an escrow scheme, not at all the ultimate solution that Cantwell and her constituents wanted. On the other hand, the chances of her bill passing were equivalent to that of Microsoft's shipping an operating system without bugs. (Even then it would face a near-certain veto.) Cantwell went back to the people who had been fighting the battle long before she switched Washingtons. Bruce Heiman of the industry group called the Business Software Alliance was encouraged that the administration was giving a framework for a compromise. Nathan Myhrvold straight out celebrated. "They blinked," he later said. All of Cantwell's advisors agreed, though, that before she stood down, she should get promises in writing.

On July 20, 1994, the afternoon before the vote, the letter from Al Gore arrived. After the usual flatulence ("I write to express my sincere appreciation for your efforts to move the national debate forward . . .") Gore got to the point.

> The administration understands the concerns that industry has regarding the Clipper Chip. We welcome the opportunity to work with industry to design a versatile, less expensive system. Such a key escrow system would be implementable in software, firmware, hardware, or any combination thereof, would not rely on a classified algorithm, would be voluntary, and would be exportable. . . . We also recognize that a new key escrow encryption system must permit the use of private-sector key escrow agents as one option.

Apparently, the White House figured that the exercise was simply a way to quiet a potential firestorm. (Later in the summer, a Defense Department official seeking clarification on the implications of the policy shift was told that the letter was intended "to placate Rep. Cantwell and avoid a national debate.") But when the contents of Gore's missive found their way to the front page of the Washington Post the next day (a slight embarrassment for Cantwell, who didn't want to look like she was showboating), the Gore people rediscovered that the Bosnia of telecommunications was as thorny as ever. The White House had made its promises without clearing them with the NSA or the FBI. (The first Clint Brooks had heard about it was the day it ran in the Washington Post.) Cantwell got a call from a Gore person. Do you mind, he asked, if we, um, rescind the letter?

"Do you know how silly you'd look?" she replied. It was, after all, Gore's letter, Gore's words. She promised that she wasn't out to milk the incident with the press, but the news was out there, and she didn't have the authority to let him rescind the agreement. So the deal stood. Cantwell dropped her bill, though in the next few years it would be only the first of a number of increasingly popular congressional initiatives to reform the export rules. Meanwhile, the Gore letter, whether intentional or not, was essentially a blueprint for the direction that the administration would take in tinkering with their ill-fated Clipper Chip. A step backward. A rejection. Another step backward. Stalling and confusion, while the great honest debate that Clint Brooks had envisioned about a national crypto policy never did come to the forefront. Meanwhile, the platform that Brooks considered absolutely essential—a full encryption solution to protect privacy, a policy that would generate a pervasive digital signature policy to empower electronic commerce and prevent electronic forgeries, and access for law enforcement—never did get straightened out.

Clint Brooks himself wanted out of the struggle. After a couple of years of driving back and forth from Maryland to D.C., having the same arguments with the same people, he asked the new NSA director if he could work on something that utilized his talents more effectively. His request was granted. Nirvana was lost.

Eliot Asher Cohen[1] (born April 3, 1956 in Boston, Massachusetts) is an American political scientist. He was a counselor in the United States Department of State under Condoleezza Rice from 2007 to 2009. In 2019, Cohen was named the 9th Dean of the Paul H. Nitze School of Advanced International Studies (SAIS) at Johns Hopkins University, succeeding the former dean, Vali Nasr.[2] Before his time as dean, he directed the Strategic Studies Program at SAIS. Cohen "is one of the few teachers in the American academy to treat military history as a serious field", according to international law scholar Ruth Wedgwood.[3] Cohen is a contributing writer at *The Atlantic*.[4]

Biography

Cohen grew up in Boston in a secular Jewish family. When he was in his teens his father became more observant and sent him to the Maimonides School, a Modern Orthodox Jewish day school in Brookline.[5] Cohen received his B.A. in government at Harvard University in 1977. He went on to receive a Ph.D. from Harvard in 1982 in political science,[6] and during his PhD training went through the Army ROTC program at Massachusetts Institute of Technology.[7]

He was an assistant professor of government and assistant dean at Harvard University from 1982 to 1985. Following this, he taught for four years at the Naval War College in the Department of Strategy, before briefly serving in 1990 on the policy planning staff in the Office of the Secretary of Defense. In 1990, Cohen began teaching at SAIS. After the 1991 Persian Gulf War, he directed the U.S. Air Force's official four-volume survey, the Gulf War Air Power Survey, until 1993, for which he received the Air Force's Exemplary Civilian Service Award. This analysis of the effect of U.S. air power was widely referenced in discussions of the Revolution in Military Affairs concept.[*citation needed*] In 1993, Paul Wolfowitz, who would later become prominent as the Deputy Secretary of Defense in the run-up to the Iraq War, became Dean of SAIS. During his brief stint at the defense policy planning staff, Cohen had worked under Wolfowitz but this was the first time they were in extended contact.

In 1997, Cohen co-founded the Project for the New American Century (PNAC), which was a center for prominent neoconservatives. He has been a member of the Defense Policy Board Advisory Committee, a committee of civilians and retired military officers that the U.S. Secretary of Defense may call upon for advice, that was instituted during the administration of President George W. Bush. He was put on the board after acquaintance Richard Perle put forward his name.[8] Cohen has referred to the War on Terrorism as "World War IV".[9] In the run-up to the 2003 invasion of Iraq, he was a member of Committee for the Liberation of Iraq, a group of prominent persons who pressed for an invasion.

On 2 March 2007, Cohen was appointed by Secretary of State Condoleezza Rice to serve as Counselor of the State Department, replacing Philip D. Zelikow.

[10] He exited government along with his peers at the end of term for the Bush presidency.

He currently sits on the America Abroad Media advisory board.[11]

Political views

Statements on US foreign policy

Cohen was one of the first neoconservatives to publicly advocate war against Iran and Iraq. In a November 2001 op-ed for *The Wall Street Journal*, Cohen identified what he called *World War IV* and advocated the overthrow of Iran's government as a possible next step for the Bush Administration. Cohen claimed "regime change" in Iran could be accomplished with a focus on "pro-Western and anticlerical forces" in the Middle East and suggested that such an action would be "wise, moral and unpopular (among some of our allies)". He went on to argue that such a policy was as important as the then identified goal of Osama Bin Laden's capture: "The overthrow of the first theocratic revolutionary Muslim state and its replacement by a moderate or secular government, however, would be no less important a victory in this war than the annihilation of bin Laden."[12]

Later in 2001, Cohen, in what was becoming a dominant theme of his writing, advocated war against Iraq once again and proceeded to outline how effortless such a military campaign would be:

> After Afghanistan, what? Iraq is the big prize... One important element will be the use of the Iraqi National Congress to help foster the collapse of the regime, and to provide a replacement for it. The INC, which has received bad, and in some cases malicious treatment, from the State Department and intelligence community over the years, may not be able to do the job with U.S. air support alone.[13]

As a result of his public statements on why a war against Iraq was necessary, Cohen was invited to appear on *CNN Wolf Blitzer Reports* and amongst other statements given in response to questioning from Blitzer offered the judgment:

> We know that he [Saddam Hussein] supports terror. There's very solid evidence that the Iraqis were behind an attempt to assassinate President Bush's father. And we—by the way, we do know that there is a connection with the 9/11 terrorists. We do know that Mohamed Atta, the ringleader of the 9/11 terrorists, met with Iraqi intelligence in Prague. So...[14]

In testifying to a Congressional House committee later in 2002, Cohen was quoted as saying:

> ..the choice before the United States is a stark one, either to acquiesce in a situation which permits the regime of Saddam Hussein to restore his economy, acquire weapons of mass destruction and pose a lethal threat to his neighbors and to us, or to take action to overthrow him. In my view, the latter course, with all of its risks, is the correct one. Indeed, the dangers of failing to act in the near future are unacceptable.[15]

In a piece for the *Wall Street Journal* on 6 February 2003, Cohen fervently praised the presentation given by then Secretary of State Colin Powell in which he outlined the case for military action against Iraq to the United Nations. He went on to indicate that it was time for those who doubted that the case had been proven to support the Bush administration in their efforts.[16]

An article written for *The Washington Post* on 10 July 2005 raised the attention of commentators in the media and "blogosphere". The piece, an attempt to articulate Cohen's self identified roles as academic, pundit, and father, was written as his son prepared to deploy to Iraq to fight a war the elder Cohen had been calling for since early 2001. The piece ends:

> There is a lot of talk these days about shaky public support for the war. That is not really the issue. Nor should cheerleading, as opposed to truth-telling, be our leaders' chief concern. If we fail in Iraq—and I don't think we will—it won't be because the American people lack heart, but because leaders and institutions have failed. Rather than fretting about support at home, let them show themselves dedicated to waging and winning a strange kind of war and describing it as it is, candidly and in detail. Then the American people will give them all the support they need. The scholar in me is not surprised when our leaders blunder, although the pundit in me is dismayed when they do. What the father in me expects from our leaders is, simply, the truth—an end to happy talk and denials of error, and a seriousness equal to that of the men and women our country sends into the fight.[17]

Q&A interview with Cohen on his *Washington Post* piece, "A Hawk Questions Himself as His Son Goes to War", July 31, 2005, C-SPAN

This piece was extensively discussed in the blogosphere at the time, with some progressive blogs decrying that Cohen continued to maintain that the invasion was justified.[*citation needed*] Other commentators expressed surprise that a figure with such access and impeccable neoconservative credentials could appear to criticise the Bush Administration in such a way. Cohen later stated that he had received overwhelmingly positive responses from senior military officials in a resulting interview on C-SPAN.[*citation needed*] Cohen also continued his criticism of the conduct of the war, stating that, "Those three guys—Tommy Franks, George Tenet, and L. Paul Bremer—got the Presidential Medal of Freedom. That's just wrong."

As a member of the Defense Policy Board Advisory Committee Cohen had also been engaged in meetings involving US President George Bush. During these meetings Cohen provided advice on strategy in the Iraq conflict.[18]

View on military experience and policy-making skills

In 2002, Cohen defended the PNAC membership against the charge that its personnel were chicken-hawks. Cohen found unsupported the opinion that, compared to civilians, veterans possess "sheer moral authority" or "are uniquely qualified to make judgments on matters of war and peace." As an example, Cohen states:

> There is no evidence that generals as a class make wiser national security policymakers than civilians. George C. Marshall, our greatest soldier statesman after George Washington, opposed shipping arms to Britain in 1940. His boss, Franklin D. Roosevelt, with nary a day in uniform, thought otherwise. Whose judgment looks better?[19]

Appointment to Department of State

On 2 March 2007, it was reported by *The Washington Post* that Cohen was to be appointed as Condoleezza Rice's "counselor" at the United States

Department of State. Cohen replaced Philip D. Zelikow and said he would fill time before appointment in April 2007 by acting as a consultant for Rice.

The tone of the *Washington Post* article—Cohen is described as a "critic" of the Iraq war—was soon criticised. An article by Ximena Ortiz in the *National Interest Online* called Cohen's ability to do the job into question and attempted to juxtapose his previous statements on the Bush administration foreign policy with the resulting war in Iraq.[20] Adding to the criticism was Glenn Greenwald of Salon.com who, describing Cohen as "extremist a neoconservative and warmonger as it gets", suggested an internal significance of the appointment for the Bush administration:

> The Cohen appointment, is clearly another instance where neoconservatives place a watchdog in potential trouble spots in the government to ensure that diplomats do not stray by trying to facilitate rapproachments between the U.S. and the countries on the neoconservative War hit list.[21]

As the controversy played out in the media, a rebuttal of sorts from Ruth Wedgwood, international law scholar at Johns Hopkins University, sought to defend Cohen from criticism.[22] Ortiz was subsequently supported in her criticism by fellow commentator at *National Interest Online*, Anatol Lieven, who raised the level of criticism to include Cohen's efforts as a historian and analyst as well as tackling other pronouncements on US foreign policy in the Middle East made by Cohen.[23]

Mearsheimer and Walt Paper

Main article: The Israel Lobby and U.S. Foreign Policy

In March 2006, Harvard's Kennedy School of Government Academic Dean Stephen M. Walt along with Professor John J. Mearsheimer of the University of Chicago, both political scientists, published an academic paper titled *The Israel Lobby and U.S. Foreign Policy*. The paper criticizes the Israel lobby for influencing U.S. foreign policy in the Middle East away from U.S. interests and towards Israel's interests. Eliot Cohen wrote in a prominent op-ed piece in *The Washington Post* that the academic working paper bears all the traditional hallmarks of anti-Semitism: "obsessive and irrationally hostile beliefs about Jews", accusations toward Jews of "disloyalty, subversion or treachery, of having occult powers and of participating in secret combinations that manipulate institutions and governments", as well as selection of "everything unfair, ugly or wrong about Jews as individuals or a group" and equally systematical suppression of "any exculpatory information".[24] Mearsheimer and Walt have denied Cohen's assertions as false, dishonest and ridiculous, noting that criticism of Israeli state policy and influential American advocates of that policy, such as Cohen, is not the same thing as demonization of Jewish people.[25]

Chuck Hagel nomination

Along with a large number of other Republicans, Cohen opposed Barack Obama's prospective nomination of Republican Chuck Hagel as U.S. Secretary of Defense in late 2012. Cohen was quoted as saying:

> If you have somebody there [at Defense] who's already made it clear that he does not want to engage in a confrontation with Iran, what kind of negotiating leverage do we have? ... You want to have as secretary of defense somebody who's the heavy. Somebody who's the guy who looks as if he's perfectly capable of waging war against you and happy to do it. That's just kind of elementary negotiating tactics.[26]

2014 Crimean crisis

Cohen wrote an op-ed piece in *The Washington Post* on 3 March 2014, between the ousting of Viktor Yanukovich on 22 February and the Crimean referendum on 16 March. In it, he maintains that "Putin is indeed a brutal Great Russian nationalist who understands that Russia without a belt of subservient client states is not merely a very weak power but also vulnerable to the kind of upheaval that toppled Yanukovych's corrupt and oppressive regime." He mentions *The New York Times* publication of the op-ed by Putin on the Syrian chemical arms question and links to the text of the NATO accord as a token of good faith.[27]

Never Trump movement

See also: List of Republicans who opposed the Donald Trump presidential campaign, 2016

Cohen wrote an op-ed piece in *The Washington Post* on 15 November 2016 after the 2016 presidential election affirming his stance against the presidency of Donald Trump. In the piece he states:

> I am a national security Never-Trumper who, after the election, made the case that young conservatives should volunteer to serve in the new administration, warily, their undated letters of resignation ready. That advice, I have concluded, was wrong. [...] My friend was seething with anger directed at those of us who had opposed Donald Trump — even those who stood ready to help steer good people to an administration that understandably wanted nothing to do with the likes of me, someone who had been out front in opposing Trump since the beginning.[28]

Cohen also wrote an op-ed piece in *The Atlantic* on 29 January 2017 commenting on his distaste for Donald Trump as a person:

> Many conservative foreign-policy and national-security experts saw the dangers last spring and summer, which is why we signed letters denouncing not Trump's policies but his temperament; not his program but his character. We were right. And friends who urged us to tone it down, to make our peace with him, to stop saying as loudly as we could "this is abnormal," to accommodate him, to show loyalty to the Republican Party, to think that he and his advisers could be tamed, were wrong.[29]

Dr. Felix Cohen

Of Newton, Entered Into Rest, December 5, 2005. Beloved husband of Frieda (Omansky). Devoted father of Stephen Cohen and his wife Betty, Richard Cohen and his wife Edith, all of Chestnut Hill, Eliot Cohen and his wife Judith of Silver Springs, MD and David Cohen and his wife Nancy of Easton, CT. Cherished grandfather of Dena, Jared, Shoshana, Joseph, Naomi, Matthew, Raphael, Michal, Rebecca, Nathan, Jessica, Jeffrey and Peter. Proud great-grandfather of Idan, Lital and Oriyah. Services were held Dec. 7, 2005. Shiva will be at the late residence from 2-5 and 7-9 PM. In lieu of flowers, donations may be made to the American Parkinson's Disease Association, 60 Bay St. #401, Staten Island, NY 10301 or to a charity of choice. Stanetsky Memorial Chapel (800) 842-4280 www.stanetsky.com

Defensively Off Target

By Dale Keiger

The nation's blueprint for future defense is predicated on a kind of warfare that may never occur again, say four defense experts from Hopkins. The plan is unimaginative, unaffordable—and already in effect.

In March 1993, the Department of Defense initiated what has come to be known as the Bottom-Up Review, or the BUR. The BUR was so named because it purported to examine U.S. defense policy from the bottom up now that the Cold War was over and the Soviet Union was not even a country, much less a threat. The 109-page final document, produced in less than eight months, constituted the blueprint for $1.3 trillion in defense spending by the Clinton administration over the next five years.

Four defense experts associated with Hopkins's Nitze School of Advanced International Studies (SAIS) believe that the BUR, and thus American defense policy, is aiming at the wrong target. For when the BUR's authors gazed into the tea leaves, they foresaw a world made more dangerous by the proliferation of nuclear weapons, but otherwise filled with familiar threats, like Iraq. They decided that the United States needed the capability to fight and win two nearly simultaneous wars of the sort it fought in the Persian Gulf in 1991. The U.S. military, under the BUR's mandate, is now pursuing that capability.

The four SAIS experts—Eliot A. Cohen, Andrew F. Krepinevich Jr., Jeffrey S. McKitrick, and Michael Vickers have gazed into the future, too, and they fear that the BUR ignores both more likely and more serious threats to American national security. The world they envision over the next 10 to 20 years is one big bad neighborhood. They expect constant low-grade warfare (low- grade on a historical scale, not to the combatants or the innocents caught in the crossfire) of the sort now occurring in Bosnia, Rwanda, the Republic of Georgia, Liberia, and Sudan. They foresee more aggression by what they call "non-state actors": Islamic extremists like Hamas, various insurgent movements, and warlord armies like those in Somalia. They anticipate regional belligerents like North Korea, Iran, and Iraq getting the capability to inflict mass destruction, principally through nuclear weapons.

In this world, the United States is unlikely, in their estimate, to once again fight a relatively straightforward war for control of territory like it fought in the Persian Gulf, much less two such wars at the same time, as the BUR envisions. They say that if the United States goes into battle again—and there's little in history to give faith that it won't—it should not assume it will confront another massed, ineptly led conventional army. Instead, it will more likely face wily streetfighters like the ones who recently kicked U.S. troops out of Somalia, and terrorist armies capable of striking anywhere in the world, and techno-saboteurs bent on disrupting the world's electronic infrastructure.

Of greater concern, the SAIS experts agree that the United States cannot complacently assume it will remain the world's sole superpower. For no period of history, they point out, has one nation-state reigned supreme for long without a challenge from an emergent rival. They are particularly concerned about China and the need to forestall a major military confrontation in Asia. They don't see evidence in the BUR of the government planning for such an eventuality.

If the United States is to defend itself and its interests, they say, its strategists must stop thinking in terms of refighting the last war (albeit with better results), and figure out how best to fight the next one. They believe that the BUR fails to take sufficient account of the fundamental rethinking of all aspects of war—tactics, operation, and strategy—that an unfolding technological revolution will necessitate. Those who fail to keep up with this revolution will be in peril, and the United States, they warn, is keeping up in technology but in danger of falling behind in strategic thinking.

In 1940, both France and Germany had modern armies, tanks, and airplanes. But the Germans had figured out how to combine them into the blitzkrieg, while the French were prepared only to use them to refight the First World War. In six weeks, German troops marched through Paris.

Cohen, Krepinevich, et al. do not want the United States of 2014 to be the France of 1940.

A professor of strategic studies at SAIS, Eliot Cohen also lectures at the National War College at Ft. McNair, Washington, D.C.; writes frequently for mainstream journals such as The New Republic, Foreign Affairs, National Review, and Commentary; and directed the Air Force's official analysis of the use of air power in the Persian Gulf War. He's the author of several books, most recently Military Misfortunes: The Anatomy of Failure in War (Vintage Books, 1991). His friend Andrew Krepinevich lectures at SAIS and is director of the non-profit, non- partisan Defense Budget Project, which studies national security policies and how defense dollars are and should be spent. Krepinevich is a graduate of Harvard and West Point, and the author of The Army and Vietnam (Johns Hopkins Press, 1986) and The Bottom-Up Review: An Assessment (Defense Budget Project, 1994).

Both men are strenuous critics of the intellectual quality of the BUR. Cohen calls it "a remarkably conservative and intellectually timid document." Krepinevich believes it was done too fast, with not enough time to consider alternatives to the sort of conventional military thinking that may have worked well in Kuwait in 1991, but may not work at all somewhere else in 1999.

They focus much of their criticism on the two-war scenario, citing history as justification. Never, says Krepinevich, starting with the American Revolution, has an enemy taken advantage of U.S. engagement in one conflict to start a second one. Why, he argues, should we plan for it to happen in the future? If the Defense Department is concerned about two simultaneous wars without historical precedent, why not three? Why not four? "The Pentagon is buying very expensive insurance against a very unlikely situation," he claims.

He and Cohen further argue that the BUR promises more than it can deliver. The United States, Cohen says, does not have the airlift and sealift capability to move troops to two simultaneous conflicts. He offers as evidence the Persian Gulf War, which required most of the U.S. air refueling capability, used virtually every F-117 Stealth fighter in the Air Force arsenal, needed help from commercial airlines to transport troops, and required the call-up of thousands of reservists.

Krepinevich has analyzed the BUR's numbers and does not see how the military can accomplish the mandated force levels and stay within the defense budget over the long term; to do so even in the short term, he says, would require sacrifices in training and modernization. The BUR states the number and types of armed forces needed for a two-war capability: a standing force of 1.5 million troops divided among 10 active Army divisions, 11 Navy carrier battlegroups (with a 12th carrier in reserve), five active Marine brigades, and 13 active Air Force wings. President Bill Clinton wants this defense structure to cost no more than $1.3 trillion during the next five years, a target $104 billion below the level projected by the last Bush administration plan.

Krepinevich says he can't be certain of the size of the budget discrepancy. But he has reviewed the BUR, media reports, the estimates of other analysts from the Defense Budget Project, and Congressional Budget Office reports, and he predicts that to pay for these forces the Defense Department could need anywhere from $11 billion to $50 billion more than the budget allows over the first five years. For the "out years," the years past the initial five-year budgeting period, he predicts a shortfall of $20 billion per year, and says that's the optimistic estimate. The services, presumably, are supposed to trim all those billions from their projected costs and still achieve the BUR's force goals, but Krepinevich asks, "How many billions can they cut before this whole structure begins to collapse?"

Cohen and Krepinevich argue that the BUR promotes preparation for the threat that is most familiar—an opponent like Iraq—because that is the threat most recent. "They've been successful," Krepinevich says, speaking of the military's experience in the Persian Gulf, "so they're preparing to do again what they've done well in the past." The problem with this reasoning, Cohen points out, is that it seems to assume our enemies were not paying attention to the fate of Saddam Hussein's troops in Kuwait.

"Analysts and generals like to refight the last battle," he says. "Unfortunately, our opponents don't." Why, he asks, after the debacle in Kuwait, would another country (or Iraq, for that matter) try to fight us in the same way? "America's opponents 10 years hence will surely have found other, less comfortable ways of securing success than by imitating Saddam Hussein," Cohen wrote in a recent issue of The New Republic. "Indeed, as General Mohamed Farah Aideed has demonstrated in Somalia, they already have."

What the United States needs, Cohen and Krepinevich argue, are plans for combatting the more likely threat of unconventional enemies who won't repeat Iraq's mistakes. Krepin- evich envisions our next regional military confrontation as one in which we face what he calls a "streetfighter" state. This enemy, whoever it may be, doesn't invade its neighbor and then try to stand off the United States with massed armored battalions, like the Iraqis did. Nor does it allow full use of American strengths like technology and logistics. Instead, it conducts a series of aggressions against another state sufficiently low in

allow full use of American strengths like technology and logistics. Instead, it conducts a series of aggressions against another state sufficiently low in intensity to make the American government and its allies unwilling to launch a Desert Storm-type response. It keeps its attacks small and sporadic. It engages in destabilization and terrorism. It works to subvert from within.

If it miscalculates and does provoke the United States into military action, it mingles its forces and strategic targets with civilian populations to make it hard for the United States to attack without killing innocent non-combatants. It threatens use of a mass- destruction weapon (a single nuclear weapon, or the credible possibility of having one, will do) to frighten away other countries from joining with the United States in a military coalition, or in trade sanctions or a blockade. It threatens environmental sabotage to any neighbor that allows the United States to base troops there. Once combat with U.S. forces begins, it does all it can to drag out the fighting, playing on the American public's historical impatience with protracted conflict and its reluctance to sustain casualties. It could ally itself with other states antagonistic to the United States, or with terrorist organizations.

Cohen points out that some of these streetfighter tactics worked in Mogadishu. "Basically, Somalia was a war we lost," he says. The BUR, he adds, does not address such situations.

Just as serious as these problems, say Cohen and Krepinevich, is the BUR's failure to address the revolutionary change in military technology that the public only glimpsed during the Gulf War. Michael Vickers is a 10-year veteran of the U.S. Army Special Forces and a PhD candidate under Cohen's tutelage. In his dissertation, he is attempting to develop a general theory of how revolutions in military capability take place. Vickers says that in the last 500 years, there have been eight of these revolutionary shifts, and he lists examples. In the 1500s, artillery provided the means to breach formerly impregnable castles. A century later, sailing ships with on-board artillery supplanted oar-driven galleys. In the mid-1800s, telegraph, railroads, and the development of accurate rifles forever changed infantry fighting, as demonstrated in the American Civil War. The Second World War saw the first effective use of mechanized armored warfare and naval aviation. A mushroom cloud over Hiroshima announced the advent of the nuclear military revolution. In each of these instances, war changed dramatically. SAIS's strategic thinkers believe another such revolution is under way.

Jeffrey McKitrick, SAIS '81, is directing a five-year study of this revolution at Science Applications International Corporation, under contract to the Pentagon's Office of Net Assessment. "People tend to think tomorrow will be like today, only a little more so," he says. But he believes that on the battlefield, at least, tomorrow will be much unlike today.

The revolution now underway, according to McKitrick, is high tech, information driven, and very deadly. He foresees weaponry—some in development but much of it already here—of incredible range, accuracy, and lethality. He says, "The Gulf War was only the precursor of the kind of things we'll be able to do. Lethality is going to increase by orders of magnitude. What it took 500,000 men to do in the Persian Gulf will be done by 50,000. Everything is becoming smaller, faster, and deadlier." Though not cheaper.

For centuries and up to the Gulf War, warfare has amounted to this: the necessity of figuring out where the enemy is, then getting close enough to kill him before he kills you, with all of this taking place under the horrific and chaotic conditions described by the eerily benign phrase "the fog of war." War is still about killing the enemy before he can kill you, but everything else is changing rapidly. Start with that metaphoric "fog of war," for example. It has always been hard, sometimes impossible, to know where you are on a battlefield and where the enemy is. Now, American troops go into battle with hand-held Global Positioning Systems, the size of paperback novels, that use satellite signals to pinpoint precisely where they are standing, in just a few seconds.

Satellites help soldiers figure out where the enemy is standing, as well. Highly defined satellite imagery, manned and unmanned reconnaissance aircraft, and advanced radar can pinpoint the location of enemy units right down to individual vehicles. Night-vision technology removes the cloak of darkness that used to hide troop movements. If the enemy tries to use radio communications or its own radar, high-tech guided weaponry locks on to those signals and follows them to their sources, destroying them. During the Gulf War, the Iraqis often did not turn on their air- defense radar because they feared that American radar- seeking missiles would wipe them out if they did.

The fog is not all gone. Cohen says Gulf War commanders sometimes had too much information; the overload created a new sort of fog, leading to misinterpretation of data, as well as hasty decisions made because ever-changing information left little time for calm ratiocination. A wily opponent can still hide a lot; American troops never did find Mohamed Farah Aideed in Mogadishu, and the official Gulf War Air Power Survey, directed by Cohen, states there's no evidence that American planes ever succeeded in knocking out a single one of Iraq's mobile SCUD missile launchers.

Still, troops on a battlefield and military installations anywhere in the theater of combat have become vulnerable to American military technology as never before. "We can see targets at great distances, and they can't see us," Krepinevich says. Says McKitrick, "Data moves so fast that information can alter everything on the battlefield not in days, not in minutes, but in nanoseconds."

There's a new strategic mantra, simplistic and not entirely accurate but indicative all the same: "If it's there, we can find it. If we can find it, we can hit it. And if we can hit it, we can kill it." Once U.S. forces find the enemy, they can hit it from greater distances than ever before. Those memorable video images on CNN during the Gulf War vividly portrayed the accuracy of precision guided weaponry, the so-called "smart bombs." Smart bombs aren't always as accurate as the Pentagon public relations apparatus would like the public (who pays for them) to believe, but when the bombs do work, their destructive capabilities are remarkable. A U.S. warship can launch a Tomahawk cruise missile and hit a specific building hundreds of miles away. Apache attack helicopters can hover in the dead of night and destroy enemy tanks whose doomed occupants didn't even know a helicopter was in the vicinity.

As the weapons have become more accurate, they've also become more deadly. A strike on a command bunker, bridge, or enemy tank doesn't merely inflict damage, as it might have 20 years ago. Now the strike often destroys. In From Gettysburg to the Gulf and Beyond, Colonel Richard J. Dunn III notes that during the Vietnam War, American fighter-bombers needed more than 700 sorties to destroy one bridge near Hanoi; during the Persian Gulf War, single F-117 Stealth fighters took out Iraqi bridges on the first try. The trend is toward even greater lethality. McKitrick says weapons researchers are approaching the capability to inflict a magnitude of damage a hundred times greater than that of any high explosive now in the arsenal. One method, McKitrick says, could be to tremendously compress a substance like mercury, under extreme temperature and pressure, then shatter it, releasing enormous energy.

Hand in hand with the development of advanced weaponry has come its proliferation. Says Krepinevich, "History would indicate that once the genie is out of the bottle regarding advanced military technology, sooner or later—usually sooner—countries that want it and can afford it acquire it." Much of this stuff is on the open market; countries can simply go shopping at the international arms bazaar. Krepinevich says Iran, besides investing in components for its own nuclear weapons program, is buying or shopping for cruise missiles and diesel-powered submarines from the Russians. From the Chinese it seeks ballistic missiles, Silkworm anti-ship missiles, and sophisticated underwater mines.

A country can easily obtain much of what might be called collateral high technology—non-weaponry that has military application—because such technology is in commercial use. During the Gulf War, says McKitrick, 70 percent of American UHF communication took place over commercial networks. Well-heeled backpackers can buy Global Positioning Systems through advertisements in Outside magazine. Several countries, including France, Russia and the United States, sell detailed satellite imagery. One person with a personal computer can locate and track targeted individual vehicles throughout the world; Federal Express does it every business day. Commercial encryption software has become so sophisticated that even the code-breakers at the National Security Agency are no longer confident of their ability to decrypt intercepted communications.

Among lesser powers, the most worrisome proliferating items are nuclear weapons. Cohen says, "It's 50-year-old technology, and anybody who really wants it can get it. What's particularly frightening is that anybody can get it without our knowing. You can hide an amazing amount. We're not omniscient at all." In directing the Gulf War Air Power Survey, Cohen was impressed by how far Iraq had gotten with its nuclear program despite the West's sophisticated surveillance. He is particularly concerned about the whereabouts of all the nuclear weapons scattered about what used to be the Soviet Union. "My personal hunch would be that some of those nukes have gone astray," he says. "If everything else has gone astray, why wouldn't people be able to buy nuclear weapons?"

Vickers thinks that within 30 years instead of a dozen or fewer nuclear powers, as now (the United States; Russia and the former Soviet republics of Ukraine, Kazakhstan, and Belarus; Britain; France; China; Israel; India; probably Pakistan; possibly South Africa), the world may have 20 or more. Cohen thinks the expanded roster could include among others Iran, Algeria, North Korea, Iraq, Saudi Arabia, Poland, Germany, and Japan.

All this diffusion of technology creates one overriding headache for American strategic planners: the greatly enhanced capacity for mischief by developing nations. Cohen and Krepinevich offer several examples of how a country that couldn't directly threaten the territory of the United States could still pose a serious threat to American global interests. Imagine for a moment that Saddam Hussein had had a credible nuclear threat when he invaded Kuwait. Would Saudi Arabia have allowed the American-led coalition to use its territory for staging Desert Storm? If North Korea develops missiles with nuclear warheads, will Japan feel compelled to get its own nuclear capability? How will China respond to that? If Algeria gets nukes and points them at Europe or Israel, what does the United States do on behalf of its allies? What does the United States do if Iran develops biological weapons? What happens if a hacker in India, which has lots of computer programmers, decides American foreign policy has tilted too far toward Pakistan and manages to hack into and crash the U.S. computerized banking transfer system?

The advent of new weaponry and military technology is only the first part of military revolutions, McKitrick says. The second part is a revolution in strategy, tactics, and organization. High-tech weapons proliferate, but not everyone will use them the same way. Some nations, as did the aforementioned France in 1940, will try to use them in the same way as older weapons. Others, recalling Nazi Germany, will figure out new strategic doctrines and organizational schemes that make overpowering use of new technology.

New weapons used in old ways can lead to disaster against opponents who use new weapons in new ways (or even old weapons in new ways). In the future, agree Cohen, Krepinevich, McKitrick, and Vickers, the enemy with a deadly, innovative strategy may not be a lesser power like North Korea or Iran. Somewhere down the road, they say, a new superpower will emerge, and it will be a serious problem for the United States if it's that rival that first develops the next strategic equivalent of blitzkrieg.

Their candidate for the next superpower rival to the United States is China. The Chinese have a booming economy, vast resources, and an enormous population that 30 years from now, according to Vickers, will consist mostly of people ages 20 to 65, the most productive years. They will be at the center of the world's next great economic center, northeastern Asia. And they feel entitled to a place among the world's great powers.

If the United States wants to forestall another confrontation of the sort it endured for four decades with the Soviet Union, says Krepinevich, it should be working now to develop new strategic doctrines that could foster cooperation and integration in a peaceful world order. He advocates more experimentation in the Defense Department and armed services, to develop organizational schemes better able to cope with the likely contingencies of the near future, such as peacekeeping missions or combat with a streetfighter enemy. He points out that the current organization of the defense budget remains based on a

primary mission formulated 30 years ago.

Greater emphasis on forward thinking need not cost much, says McKitrick: "You don't need a lot of money to think." Krepinevich points out that between World War I and World War II, Admiral William Sowden Simms worked out naval aviation doctrines and Marine General John Archer Lejeune developed methods of amphibious island assault on shoestring research budgets.

What they did have, however, was incentive and encouragement—institutional support, says Cohen. For people in the defense establishment to think through the long-term implications and innovative applications of revolutionary technology, someone must provide them with the time, resources, and motivation. The present system, as epitomized in the BUR, Cohen says, tends to encourage a short-term view. Presidents, defense secretaries, service secretaries, and the Joint Chiefs of Staff usually serve short terms, sometimes less than four years. Their first concern is that nothing go wrong on their watch. They are insufficiently interested (and, says Cohen, provided with insufficient reason to be interested) in working on plans that may not pay off for 10 or 20 years. People lower in the ranks could do it, but the promotion system tends to discourage creative thinking, says Krepinevich; the way for a captain or major to make top rank is to master the tried and true.

"I don't have a master solution to all this," Cohen says. But he believes a solution starts with a president who is aware of the need to plan for the changes under way in warfare; who will devote time and energy to defense issues; and who wants his defense secretary to take charge of the Pentagon instead of merely preventing the military from giving him grief. "An enormous amount hinges on the president," Cohen says. "You have to have a president who thinks foreign policy and military affairs are important. And that's not the president we have."

When asked if he thinks the United States can sustain its present strategic advantage over the next few decades, McKitrick says, "Unknown, and fraught with unknown unknowns. There's no way to tell if we're doing enough." Krepinevich likes to quote the saying: "Predicting is difficult, especially about the future." He defends his conclusions versus those of the BUR's authors in this way: "Their work is an extrapolation out of the Cold War. My work is an extrapolation out of centuries of history. It's the history of revolutionary change that you have to look at."

Eliot Cohen does feel confident about one thing, though: "The only thing I'm sure of is that defense analysts are not going to go out of business."

Other Important Bonesmen

Richard M. Bissell, Jr. was a very important man to the denizens of Jupiter Island. He graduated from Yale in 1932, the year after the Harrimanites bought the island. Though not in Skull and Bones, Bissell was the younger brother of William Truesdale Bissell, a Bonesman from the class of 1925. Their father, Connecticut insurance executive Richard M. Bissell, Sr., had put the U.S. insurance industry's inside knowledge of all fire-insured industrial plants at the disposal of government planners during World War I.

The senior Bissell, a powerful Yale alumnus, was also the director of the Neuro-Psychiatric Institute of the Hartford Retreat for the Insane; there, in 1904, Yale graduate Clifford Beers underwent mind-destroying treatment which led this mental patient to found the Mental Hygiene Society, a major Yale-based Skull and Bones project. This would evolve into the CIA's cultural engineering effort of the 1950s, the drugs and brainwashing adventure known as ``MK-Ultra.''

Richard M. Bissell, Jr. studied at the **London School of Economics** in 1932 and 1933, and taught at Yale from 1935 to 1941. He then joined Harriman's entourage in the U.S. government. Bissell was an economist for the Combined Shipping Adjustment Board in 1942-43, while Averell Harriman was the U.S. leader of that board in London.

In 1947 and 1948, Bissell was executive secretary of the ``Harriman Commission,'' otherwise known as the President's Commission on Foreign Aid. When Harriman was the administrator of the Marshall Plan, Bissell was assistant administrator.

Harriman was director of Mutual Security (1951-53), while Bissell was consultant to the director of Mutual Security 1952.

Bissell then joined **F. Trubee Davison** at the **Central Intelligence Agency. When Allen Dulles became CIA Director, Bissell was one of his three aides.**

Why could this be of interest to our Floridians? We saw in Chapter 4, that the great anti-Castro covert initiative of 1959-61 was supervised by an awesome array of Harriman agents. We need now add to that assessment only the fact that the detailed management of the invasion of Cuba, and of the assassination planning, and the training of the squads for these jobs, was given into the hands of Richard M. Bissell, Jr.

This 1961 invasion failed. Fidel Castro survived the widely-discussed assassination plots against him. But the initiative succeeded in what was probably its core purpose: to organize a force of multi-use professional assassins.

The Florida-trained killers stayed in business under the leadership of **Ted Shackley**. They were all around the assassination of President Kennedy in 1963. They kept going with the Operation Phoenix mass murder of Vietnamese civilians, with Middle East drug and terrorist programs, and with George Bush's Contra wars in Central America.

Thesis

Semiclassical theory of vibrationally inelastic scattering, with application to $H^+ + H_2$ (1974)

Doctoral advisor

James Cross

Francis Sellers Collins ForMemRS (born April 14, 1950) is an American physician-geneticist who discovered the genes associated with a number of diseases and led the Human Genome Project. He is director of the National Institutes of Health (NIH) in Bethesda, Maryland, United States.

Before being appointed director of the NIH, Collins led the Human Genome Project and other genomics research initiatives as director of the National Human Genome Research Institute (NHGRI), one of the 27 institutes and centers at NIH. Before joining NHGRI, he earned a reputation as a gene hunter at the University of Michigan.[1] He has been elected to the Institute of Medicine and the National Academy of Sciences, and has received the Presidential Medal of Freedom and the National Medal of Science.

Collins also has written a number of books on science, medicine, and religion, including the New York Times bestseller, The Language of God: A Scientist Presents Evidence for Belief. After leaving the directorship of NHGRI and before becoming director of the NIH, he founded and served as president of The BioLogos Foundation, which promotes discourse on the relationship between science and religion and advocates the perspective that belief in Christianity can be reconciled with acceptance of evolution and science, especially through the idea that the Creator brought about his plan through the processes of

evolution.[2] In 2009, Pope Benedict XVI appointed Collins to the Pontifical Academy of Sciences.[3]

Early years[edit]

Collins was born in Staunton, Virginia, the youngest of four sons of Fletcher Collins and Margaret James Collins. Raised on a small farm in Virginia's Shenandoah Valley, Collins was home schooled until the sixth grade.[4] He attended Robert E. Lee High School in Staunton, Virginia. Through most of his high school and college years he aspired to be a chemist, and he had little interest in what he then considered the "messy" field of biology. What he referred to as his "formative education" was received at the University of Virginia, where he earned a Bachelor of Science degree in Chemistry in 1970. He went on to graduate as a Doctor of Philosophy in physical chemistry at Yale University in 1974.[5] While at Yale, a course in biochemistry sparked his interest in the subject. After consulting with his mentor from the University of Virginia, Carl Trindle, he changed fields and enrolled in medical school at the University of North Carolina at Chapel Hill, earning a Doctor of Medicine degree there in 1977.[6]

From 1978 to 1981, Collins served a residency and chief residency in internal medicine at North Carolina Memorial Hospital in Chapel Hill. He then returned to Yale, where he was a Fellow in Human Genetics at the medical school from 1981 to 1984.

Genetics research[edit]

At Yale, Collins worked under the direction of [**Dr. Sherman Morton Weissman (born 1930)**], and in 1984 the two published a paper, "Directional cloning of DNA fragments at a large distance from an initial probe: a circularization method".[7] The method described was named chromosome jumping, to emphasize the contrast with an older and much more time-consuming method of copying DNA fragments called chromosome walking.[8]

Collins joined the University of Michigan faculty in 1984, rising to the rank of professor in internal medicine and human genetics. His gene-hunting approach, which he named "positional cloning",[9][10] developed into a powerful[11] component of modern molecular genetics.

Several scientific teams worked in the 1970s and 1980s to identify genes and their loci as a cause of cystic fibrosis. Progress was modest until 1985, when Lap-Chee Tsui and colleagues at Toronto's Hospital for Sick Children identified the locus for the gene.[12] It was then determined that a shortcut was needed to speed the process of identification, so Tsui contacted Collins, who agreed to collaborate with the Toronto team and share his chromosome-jumping technique. The gene was identified in June 1989,[13][14] and the results were published in the journal Science on September 8, 1989.[15] This identification was followed by other genetic discoveries made by Collins and a variety of collaborators. They included isolation of the genes for Huntington's disease,[16] neurofibromatosis,[17][18] multiple endocrine neoplasia type 1,[19] inv(16) AML[20] and Hutchinson–Gilford progeria syndrome.[21]

Genomics[edit]

In 1993 National Institutes of Health Director Bernadine Healy appointed Collins to succeed James D. Watson as director of the National Center for Human Genome Research, which became National Human Genome Research Institute (NHGRI) in 1997. As director, he oversaw the International Human Genome Sequencing Consortium,[22] which was the group that successfully carried out the Human Genome Project.[23]

In 1994 Collins founded NHGRI's Division of Intramural Research,[24] a collection of investigator-directed laboratories that conduct genome research on the NIH campus.

In June 2000 Collins was joined by President Bill Clinton and biologist Craig Venter in making the announcement of a working draft of the human genome.[25] He stated that "It is humbling for me, and awe-inspiring to realize that we have caught the first glimpse of our own instruction book, previously known only to God."[26][27][28] An initial analysis was published in February 2001, and scientists worked toward finishing the reference version of the human genome sequence by 2003, coinciding with the 50th anniversary of James D. Watson and Francis Crick's publication of the structure of DNA.

Another major activity at NHGRI during his tenure as director was the creation of the haplotype map of the human genome. This International HapMap Project produced a catalog of human genetic variations—called single-nucleotide polymorphisms—which is now being used to discover variants correlated with disease risk. Among the labs engaged in that effort is Collins' own lab at NHGRI, which has sought to identify and understand the genetic variations that influence the risk of developing type 2 diabetes.

In addition to his basic genetic research and scientific leadership, Collins is known for his close attention to ethical and legal issues in genetics. He has been a strong advocate for protecting the privacy of genetic information and has served as a national leader in securing the passage of the federal Genetic Information and Nondiscrimination Act, which prohibits gene-based discrimination in employment and health insurance.[29] In 2013, spurred by concerns over the publication of the genome of the widely used HeLa cell line derived from the late Henrietta Lacks, Collins and other NIH leaders worked with the Lacks family to reach an agreement to protect their privacy, while giving researchers controlled access to the genomic data.[30]

Building on his own experiences as a physician volunteer in a rural missionary hospital in Nigeria,[31] Collins is also very interested in opening avenues for genome research to benefit the health of people living in developing nations. For example, in 2010, he helped establish an initiative called Human Heredity and Health in Africa (H3Africa)[32] to advance African capacity and expertise in genomic science.

Collins announced his resignation as NHGRI director on May 28, 2008, but has continued to lead an active lab there with a research focus[33] on progeria and type 2 diabetes.[34]

NIH director[edit]

Nomination and confirmation[edit]

Collins with Health and Human Services Secretary Kathleen Sebelius after swearing-in ceremony

On July 8, 2009, President Barack Obama nominated Collins as director of the National Institutes of Health,[35] and the Senate unanimously confirmed him for the post. He was sworn in by Health and Human Services Secretary Kathleen Sebelius on August 17, 2009.[36]

Science writer Jocelyn Kaiser opined that Collins was "known as a skilled administrator and excellent communicator," that Obama's nomination "did not come as a big surprise" and that the appointment "ignited a volley of flattering remarks from researchers and biomedical groups." Yet, she wrote, Collins "does have his critics," some of them who were concerned with the new director's "outspoken Christian faith."[37]

Washington Post staffer David Brown wrote, however, that Collins' status as a "born-again Christian . . . may help him build bridges with those who view some gene-based research as a potential threat to religious values."[38] Collins' appointment was welcomed by the chief executive officer of the American Association for the Advancement of Science[38] and by Bernadine Healy, the former head of the National Institutes of Health.[39]

In October 2009, shortly after his appointment as NIH director, Collins stated in an interview in The New York Times: "I have made it clear that I have no religious agenda for the N.I.H., and I think the vast majority of scientists have been reassured by that and have moved on."[40]

On October 1, 2009, in the second of his four appearances on The Colbert Report, Collins discussed his leadership at the NIH and other topics such as personalized medicine and stem cell research. And, in November 2011, Collins was included on The New Republic's list of Washington's most powerful, least famous people. Collins appeared on the series finale of The Colbert Report, participating in a chorus with several other famous people singing "We'll Meet Again".[41][42]

On June 6, 2017, President Donald Trump announced his selection of Collins to continue to serve as the NIH Director.

On 19 December 2017, Collins and the NIH lifted the Obama moratorium on gain of function research because it was deemed to be "important in helping us identify, understand, and develop strategies and effective countermeasures against rapidly evolving pathogens that pose a threat to public health."[43]

On January 15, 2021, President-elect Joe Biden announced his selection of Collins to continue to serve as NIH Director.[44]

Projects[edit]

Collins was instrumental in establishing the National Center for Advancing Translational Sciences (NCATS) on December 23, 2011.[45] In January 2013, Collins created two senior scientific positions on Big Data [46] and the diversity of the scientific workforce.[47] Other projects he took on early in his tenure included increased support for Alzheimer's disease research, which was announced in May 2012;[48] the Brain Research through Advancing Innovative Neurotechnologies (BRAIN) Initiative, announced by President Obama and Collins on April 2, 2013, at the White House; and, in February 2014, the Accelerating Medicines Partnership (AMP), a public-private partnership between NIH, the U.S. Food and Drug Administration, 10 biopharmaceutical firms, and multiple non-profit organizations.

In 2014, Collins worked with the larger biomedical research community to create principles and guidelines to foster rigor and reproducibility[49] in preclinical research, including incorporating sex as a biological variable to ensure differences in treatment response between men and women are addressed.[50]

In January 2015 President Obama announced the NIH-led Precision Medicine Initiative (PMI), later renamed the All of Us Research Program, in his State of the Union address.[51] All of Us seeks to extend precision medicine to all diseases by building a national research cohort of 1 million or more U.S. participants.

In other precedent-setting actions during his time as NIH director, Collins announced in November 2015 that NIH will no longer support any biomedical research involving chimpanzees.[52] In December 2015, Collins and other NIH leaders released a detailed plan that charted a course for NIH's efforts over the ensuing five years The NIH-Wide Strategic Plan, Fiscal Years 2016-2020: Turning Discovery Into Health was aimed at ensuring the agency remains well positioned to capitalize on new opportunities for scientific exploration and to address new challenges for human health.[53]

In January 2016, President Obama announced a new initiative to galvanize the nation's research efforts against cancer.[54] Fueled by an additional $680 million in the proposed fiscal year 2017 budget for NIH, the National Cancer Moonshot Initiative aims to accelerate progress toward the next generation of interventions to reduce cancer incidence and improve patient outcomes.[55] In 2016, Collins instituted a number of clinical trial reforms[56] to enhance protection of participants in research and improve reporting of research results in ClinicalTrials.gov.[57] In 2017, Collins implemented the Next Generation Researchers Initiative[58] to improve the odds for early investigators to win NIH grants.[59]

To support the Administration's Stop Opioid Abuse Initiative, Collins launched the NIH HEAL (Helping to End Addiction Long-term℠) Initiative in April 2018.[60] The NIH HEAL Initiative℠ bolsters research across NIH to improve treatments for opioid misuse and addiction and enhance pain management. Also in 2018, Collins launched an initiative to address sexual harassment in science and change a culture that sends messages to women and other underrepresented groups that they don't belong in biomedical research.[61]

Music[edit]

Collins' love of guitar playing and motorcycle riding is often mentioned in articles about him.[62]

While directing NHGRI, he formed a rock band with other NIH scientists. Sometimes the band, called the Directors, dueled with a rock band from Johns Hopkins University led by cancer researcher Bert Vogelstein. Lyrics of the Directors' songs included spoofs of rock and gospel classics re-written to address the challenges of contemporary biomedical research.[63] Collins has performed at TEDMED 2012, StandUpToCancer,[64] The 2017 Southern Methodist University Commencement[65] and Rock Stars of Science.[66]

His passion for music also inspired him to partner with the Kennedy Center to expand the Sound Health Initiative, which was announced in February 2017.[67] Sound Health aims to expand current knowledge and explore ways to enhance the potential for music as therapy for neurological and other disorders.[68]

Awards and honors[edit]

While leading the National Human Genome Research Institute, Collins was elected to the Institute of Medicine and the National Academy of Sciences. He was awarded the Canada Gairdner International Award in 1990. He was a Kilby International Awards recipient in 1993.[69] Collins received the Golden Plate Award of the American Academy of Achievement in 1994.[70] He received the Biotechnology Heritage Award with J. Craig Venter in 2001, from the Biotechnology Industry Organization (BIO) and the Chemical Heritage Foundation.[71][72] Collins and Venter shared the "Biography of the Year" title from A&E Network in 2000.[73] In 2005, Collins and Venter were honored as two of "America's Best Leaders" by U.S. News & World Report and the Harvard University Center for Public Leadership.[74]

In 2005 Collins received the William Allan Award from the American Society of Human Genetics. In 2007 he was presented with the Presidential Medal of Freedom.[75] In 2008 he was awarded the Inamori Ethics Prize[76] and National Medal of Science.[77] In the same year, Collins won the Trotter Prize where he delivered a lecture called "The Language of God".

Collins also received the Albany Medical Center Prize in 2010 and the Pro Bono Humanum Award of the Galien Foundation in 2012, the Federation of American Societies for Experimental Biology (FASEB) Public Service Award in 2017,[78] the Pontifical Key Scientific Award in 2018,[79] and the Warren Alpert

Foundation Prize in 2018.[80]

In 2020 he received the Templeton Prize[81] and was elected a Foreign Member of the Royal Society.[82]

Views[edit]

Christianity[edit]

By graduate school, Collins considered himself an atheist. However, a conversation with a hospital patient led him to question his lack of religious views, and he investigated various faiths. He familiarized himself with the evidence for and against God in cosmology, and on the recommendation of a Methodist minister used Mere Christianity by C. S. Lewis as a foundation to develop his religious views. He believes that people cannot be converted to Christianity by reason and argument alone, and that the final stage of conversion entails a "leap of faith".[83] After several years of deliberation, he finally converted to Christianity during a trip to the Cascade Mountains, where he describes a striking image of a frozen waterfall as removing his final resistance, resulting in his conversion the following morning.[83] He has described himself as a "serious Christian".[29]

In his 2006 book The Language of God: A Scientist Presents Evidence for Belief, Collins wrote that scientific discoveries were an "opportunity to worship" and that he rejected both Young Earth creationism and intelligent design. His own belief, he wrote, was theistic evolution or evolutionary creation, which he preferred to call BioLogos. He wrote that one can "think of DNA as an instructional script, a software program, sitting in the nucleus of the cell".[84] He appeared in December 2006 on The Colbert Report television show and in a March 2007 Fresh Air radio interview to discuss this book.[85][86] In an interview with D. J. Grothe on the Point of Inquiry podcast, he said that the overall aim of the book was to show that "one can be intellectually in a rigorous position and argue that science and faith can be compatible", and that he was prompted to write the book because "most people are seeking a possible harmony between these worldviews [science and faith], and it seems rather sad that we hear so little about this possibility.[87] Collins said he had been a Methodist, Presbyterian, Baptist, and Episcopalian, emphasizing that denominational differences were not essential to him.[88] He recalled that, growing up, he participated in the choir of an Episcopal church.[89]

Collins is a critic of intelligent design, and for this reason he was not asked to participate in the 2008 documentary Expelled: No Intelligence Allowed. Walt Ruloff, a producer for the film, claimed that by rejecting intelligent design, Collins was "toeing the party line", a claim which Collins called "just ludicrous".[90] In an interview he stated that "intelligent design is headed for collapse in the not too distant future" and that "science class ought to be about science, and opening the door to religious perspectives in that setting is a big mistake."[87] In 2007, Collins founded the BioLogos Foundation to "contribute to the public voice that represents the harmony of science and faith". He served as the foundation's president until he was confirmed as director of the NIH.[91] Collins has also spoken at the Veritas Forum on the relationship between science and religion and the existence of God.[92]

Christopher Hitchens referred to Francis Collins as "one of the greatest living Americans" and stated that Collins was one of the most devout believers he had ever met.[93] He further stated that Collins was sequencing the genome of the cancer that would ultimately claim Hitchens's life, and that their friendship despite their differing opinion on religion was an example of the greatest armed truce in modern times.[94]

Agnosticism[edit]

In an interview with National Geographic in February 2007, writer John Horgan criticized Collins' description of agnosticism as "a cop-out". In response, Collins clarified his position on agnosticism so as to exclude:

"earnest agnostics who have considered the evidence and still don't find an answer. I was reacting to the agnosticism I see in the scientific community, which has not been arrived at by a careful examination of the evidence. I went through a phase when I was a casual agnostic, and I am perhaps too quick to assume that others have no more depth than I did."[95]

Abortion[edit]

In a 1998 interview with Scientific American, Collins stated that he is "intensely uncomfortable with abortion as a solution to anything" and does not "perceive a precise moment at which life begins other than the moment of conception". However, in the same interview it was said that Collins also "does not advocate changing the law".[96]

THE “C” IN Joe Colvin’s name could stand for continuity. As the 56th president of the American Nuclear Society, Colvin says that he will continue the agenda set by his immediate predecessors— ANS presidents Don Hintz (2007–2008), Bill Burchill (2008–2009), and Tom Sanders (2009–2010)—to ensure that ANS is a key player in the nuclear renaissance and the new-build era.

At age 67, Colvin is “theoretically retired,” he said, having left the Nuclear Energy Institute in 2005 as its president and chief executive officer. But he is still on the go. Recently, upon his return home from a business trip, his wife, Bunny, said to him, “Do you realize you’re going to be gone 16 days this month?”

After his many years with NEI, Colvin remains very active in the industry. He is on the boards of Cameco Corporation, the world’s largest uranium company, and US Ecology, a hazardous and radioactive waste treatment disposal company. He also is on the boards of not-for-profit organizations such as the Foundation for Nuclear Studies, which was set up by NEI to help provide the U.S. House and Senate with information on nuclear technology.

Naval days

Colvin graduated from hi-h school at 17. “I found high school quite uninvigorating,” he admits. “It was boring.” He considered going to college, but his family wasn’t well=off, and he didn’t have the grades in high school to earn a scholarship. “And I wasn’t really ready to go to college,” he said. “My mental attitude wasn’t there.”

Colvin had grown up tinkering with anything mechanical—taking things apart to see how they worked. When he was 14, his parents bought him a 1935 Ford, using money out of his own savings account. “I was working by the time I was 10 years old,” he said. **“I worked in local amusement parks, and when I was 12 I worked in a landscaper’s nursery. My parents bought me the car as a project. Over a few years, I ended up completely redoing the body with 19 coats of hand-rubbed lacquer. I rebuilt the engine. By the time I was 16, my friends and I were involved in quarter-mile drag racing.**”

Colvin knew that he needed to develop a skill or a career, so **he joined the U.S. Navy to become a pilot**. His eyesight, however, wasn’t good enough to put him in the cockpit. “I could fly in the backseat,” he said, “but my theory was that if I was going to be on the plane, I was going to drive.”

The Navy suggested an alternative. “Since you can’t do that, how would you like to go in a submarine? You can fly underwater,” Colvin remembered. And so **at age 17** [being born in November 1942, this would be late 1959 or early 1960]**, he entered the submarine program and was sent for six months of training to Missile Technician “A” school in Virginia, where basic proficiency in electronics and missile guidance systems is taught.** “T training combined the nuclear weapons side of the business and the electronics, digital controls, and guidance systems side,” he said. “It had to do with engineering, and I knew I was cut out for that.”

His first assignment after training was on a diesel submarine equipped with a Regulus nuclear missile. Colvin said that during his first year on the sub, he figured out that the only difference between the officers and the enlisted men was the gold on the officers’ sleeves, and the fact that they had earned college degrees, while most enlisted men had not. “At that point I made a decision to finish out my Navy career and go to school,” he said.

In the meantime, however, the Navy established the Navy Enlisted Scientific Education Program, which in its first year selected 100 enlisted men to enroll in four-year programs at 22 colleges and universities in the United States. “It was total immersion— spring, summer, fall, winter,” he said. “Your job was to go to school. **I was lucky enough to get picked for the program, and so I stayed in the Navy**.”

[See here - https://newspaperarchive.com/albuquerque-journal-jan-02-1959-p-33/ .. Feb 2 1959 it was announced]

Colvin selected the **University of New Mexico (UNM)**, in Albuquerque. “It was one of the top schools for electrical engineering, which is what I wanted to major in,” he said. It also was his introduction to New Mexico, a state that would eventually

become his home**. Colvin spent four years at UNM as an undergraduate, and then worked on his master’s degree in nuclear engineering until Adm. Hyman Rickover, the “father of the nuclear Navy,” told him to get back on a submarine and out to sea.**

During his university career, Colvin was promoted through the ranks to chief petty officer, which was such a rapid ascent that it is nearly unheard of even today, according to Colvin. For each of his career advancements, from chief engineer to

commanding officer of a nuclear-powered submarine, **Colvin was interviewed by Rickover, who handpicked every officer for the Navy’s nuclear program**.

While attending UNM, Colvin worked nights for **Eberline Instruments**, a company that made radiation detection equipment and other components. His job was to calibrate and repair the company’s digital equipment for **Sandia Laboratory** (which became a national lab in 1979) and **Kirtland Air Force Base.**

Colvin finished school in 1969 at age 27, and upon graduation he was sent to the Navy’s nuclear power school in Vallejo, Calif., for six months of training, and then to another six months’ training on a prototype reactor in Idaho. After that, he was assigned to a submarine docked at Pearl Harbor, Hawaii.

The Navy turned out to be “a great path” for Colvin, he said, adding that it was tremendously hard work, but rewarding. The biggest difficulty was the family separation. “There were times when I was gone for a year at a time without coming home,” he said. “I would come home to Hawaii and would be there for a month. The next thing you know I would come home at night and say, ‘Honey, I’m leaving in the morning.’ ‘Where are you going?’ ‘I can’t tell you.’ ‘How long are you going to be gone?’ ‘I don’t know.’ It was really hard, especially on the family.”

Musical roots

Colvin was born in November 1942 in a small town in Oklahoma, where his family was in the business of bottling the Dr. Pepper soft drink. When Colvin was three years old, he and his mother traveled by train to California to visit his father, who was serving in World War II. On the way, Colvin played with a little girl who became violently ill during the trip and had to be taken off board. Two weeks later, Colvin came down with polio, and he was paralyzed from the waist down on his right side for

about three years. “I was in the hospital for about six months, and in the pool every day for therapy,” he said. “I got shots every day, and I wore braces for several years. I’m really lucky to have come out of it.”

Colvin grew up in California’s San Fernando Valley, in the Tuluca Lake–North Hollywood area. His entire family—his mother, father, stepmother, stepfather, aunts, uncles, and brother—were performing artists, either actors, actresses, dancers, or musicians. His father was a musician for Paramount Studios, and his mother played the marimba. And the man who became Colvin’s stepfather, Earl Hatch, was known as the unofficial “father of the marimba” in the United States. Hatch brought the marimba into prominence, and for many years he worked for Disney, doing percussion for the movies Fantasia, Snow White, and other classic Disney films.

Colvin's sister was a harpist, and his brother played the upright bass. Colvin's parents required that he take piano lessons. "We lived in the back of a large music studio," he said. "Every morning I would get up an hour earlier than any of my friends and go into the studio to practice classical music on a concert grand piano. My stepfather would lie in the back with his eyes closed, critiquing every note I played."

Colvin took piano lessons for nine years, and although he can read notes well, he admits that he plays mechanically, not artistically. His brother, on the other hand, studied piano for only one year, but he became a professional musician, playing with the band Three Dog Night and artists Madonna and Dan Fogelberg, among others.

Colvin himself also rubbed elbows with Hollywood celebrities. **He helped cut the grass at the home of Bob and Dolores Hope**, and he grew up around the corner from Annette Funicello, who was a good friend.

His wife's real name is Carole Anne, but she goes by "Bunny." She was born around Easter time, and when her parents brought her home from the hospital, her older brother said, "She looks like a little bunny!"

The name stuck. Bunny grew up in the South, and everyone in her family has a nickname. Her older brother is Bubba, her sister is Treatie, and another brother is known as Fella.

While Colvin was going to the Navy's "A" school in Virginia, he worked part time at a race track that featured go-karts that traveled 60 to 70 miles per hour on the straightaway. He got to know a family that frequented the track—a husband and wife with two young children. Another occasional visitor that Colvin chatted with was a blond teenage girl who drove a Karmann Ghia.

One night the family invited Colvin to their home for Sunday dinner. After they finished dinner and he was about to leave, the blond girl walked in the door. It turned out to be Bunny, the family's oldest daughter.

Colvin and Bunny started dating, and they married in 1962, when he was 19 and she was 16. They have been married 48 years. Two months after their wedding day, Colvin went to sea for about three months.

It was **mid-October 1962, the time of the Cuban Missile Crisis, a confrontation between the Soviet Union, Cuba, and the United States. In September 1962, the Cuban and Soviet governments had begun to surreptitiously build bases in Cuba for a**

number of ballistic nuclear missiles with the ability to strike most of the continental United States. The United States announced that it would not permit offensive weapons to be delivered to Cuba and demanded that the Soviets dismantle the missile bases under construction or completed in Cuba and remove all offensive weapons.

"I was out at sea, and my new wife was back at home," he said. "At that point, it was really tenuous. We figured that if we had to launch missiles, we would survive, but no one else would. Psychologically, it was a troubling dynamic."

The Colvins have two adult children. **Daughter Melissa lives in Washington, D.C., and is the head of sales and marketing for Urenco, the European uranium enrichment company.** She and her husband, Chris, a marine biologist who works for the Pew Foundation, are the parents of the Colvins' 13-year-old grandson, Devon. The Colvins' son, Bob, lives in Boulder, Colo.

NEI involvement

In the early 1980s, as Colvin's Navy career was winding down, he interviewed with Stone & Webster Engineering in Boston, but he leaned more toward working for the new **Institute of Nuclear Power Operations (INPO)** because it seemed to be a natural fit for him. **During his final two and a half years in the Navy [in the early 1980s?], Colvin was on the Nuclear Propulsion Examining Board, a group of 16 hand-picked officers who went out in teams to evaluate the safety of every U.S. Navy nuclear ship, submarine, and shore base around the world. Colvin says it was a great experience.**

"It was interesting to me because nuclear submarines—the reactors and the operations— are very standard," he says. "And yet, you would go onboard this ship versus that ship and you could see how differently they were operated, how successful or unsuccessful they were. It was all basically because of management. It was all because of the people. The differences had to be the people, because the processes, procedures, and manuals were all very strict. That was eye-opening to me."

The examining board was feared by the rest of the Navy, Colvin said, because it had total autonomy. "If we thought a ship or submarine was not operating safely, we would have it returned to port and shut down, and typically the commanding officer would be relieved," said Colvin, adding that the board was essential to preserving the safety of the operations of the ships.

[1983/1984-ISH : Joseph F Colvin joins Institute of Nuclear Power Operations (INPO)]

After the Three Mile Island accident in 1979, the nuclear power industry decided it needed something similar to the Navy's board to look at the safety of nuclear plant operations and increase the level of operations above that required by government

regulations. That effort led to the formation of INPO [**Institute of Nuclear Power Operations**], headquartered in Atlanta, Ga. "I went to work there in the early stages and helped get INPO off the ground, running the Operations Division," he said. "We'd look at the operations of a plant, the senior reactor operators, reactor operators, and all that side of the business." Later, he took over the Technical Support and Design Engineering side of INPO, which involved the engineering work process. After that, it was over to the Construction Project Evaluation Division.

By 1984, the interface between the industry and the government regulators—the Nuclear Regulatory Commission in particular, according to Colvin—mainly involved the vendors—"the Westinghouses, the General Electrics, and the Babcock & Wilcoxes"— with little participation from the utilities. Yet, Colvin said, in the aftermath of the TMI accident, the utilities were being asked to do things at nuclear power plants that didn't make sense. "It was a flood of requirements and changes," he said. "One change would be ordered, but then another course was set soon after that. It was just dragging the industry down."

So INPO helped set up a group called the Nuclear Utility Management and Human Resources Committee (NUMARC), which consisted of a representative (usually the president or chief executive officer) from each of the 55 nuclear utilities that existed at the time. "We got all 55 of them together and said, 'We have to take charge of our destiny,'" Colvin said. It was the beginning of the industry's becoming responsible for its future.

The effort worked so well as a committee that it was decided in 1986 to set it up as a permanent organization, also called NUMARC, in Washington D.C. Colvin established the new organization and was charged with running it. Other industry initiatives also were changed—the Atomic Industrial Forum was dissolved and the U.S. Council for Energy Awareness (USCEA) became more of a public group. Then **in 1994, NUMARC and USCEA were combined into the new Nuclear Energy Institute. Colvin was named executive vice president and chief operating officer.** Phillip Bayne, a utility CEO, was named

president. In 1996, Colvin took over as president and CEO of NEI, and he stayed there until his retirement in 2005.

The highlights during his time at NEI include the work done to find a solution for high-level waste—the now-canceled Yucca Mountain repository; the involvement in license renewal for power plants, doing all the analytical work along with the Electric Power Research Institute to get the plants ready to extend their lives; promoting new reactor designs in anticipation of the new nuclear build, including the changes to legislation and the regulations in 10 CFR Part 52, which spells out the licensing procedure used for all the new build; and improvements in the regulatory processes between the industry and the NRC.

Most of Colvin's time in his later years at NEI involved working with the political system, talking with senators, congressmen, and various committees. "I probably spent 75 percent of my time dealing with the administration or on Capitol Hill, looking at how to bring about positive change to the industry," he said.

One major change for the industry will come when new reactors are built. Colvin said that he thinks that utilities are going to line up for new plant orders after the first one is constructed in the United States. "Once the decision is made to build the first plant and we show some real success in that we can actually make these regulatory systems work efficiently, then there is going to be a tremendous queue," he said. But, he added, everybody wants to be second. "They don't want to be first, because of the huge risk."

A new nuclear plant will cost $8 billion to $12 billion to bring on line. If a utility has a market capitalization of $35 billion, investing in the new plant will take one third of it. "The decision for the utility's board is

going to be a tough one," he said, "which is why we need the incentives that the government is offering, such as loan guarantees."

Regarding new reactors, Colvin said that ANS supports all of the new reactor designs. "It's not up to the society to pick a technology or reactor size," he said. "We need to provide the technical and scientific support so that all the designs have an opportunity to be successful."

Colvin said that he is confident that the lack of a national repository for spent nuclear fuel is not going to be an issue for the new reactor builds. "We can store this material safely at the sites," he said. "Most of the people I talk with at the utilities don't see that as a significant issue."

He said that there is an interesting dichotomy in shutting down the Yucca Mountain Project and at the same time needing more nuclear power plants because of climate change. "Nuclear has a great opportunity today because of the recognition of its importance to climate," he said. "I think that's going to overshadow a lot of what is going on regarding the waste issue concern."

Also a boon for nuclear is the prospect of the tax base and the jobs created in local populations through the construction of new nuclear plants. "If you take Calvert Cliffs in Maryland as an example, they are talking about building a U.S. EPR. There are going to be 4000 construction jobs over a period of about six to seven years in that area, and about 400 to 500 permanent jobs," he said. "Calculate the economic benefits to that community. The people who live in the area already see it because of the existing Calvert Cliffs plants. Hearings were held about the new reactor build in that area a while back. Antinukes who came in from outside the local area were shouted down by the public. The people said, 'This is our plant. This is our area. You go home.'"

Colvin said that for every population center around the existing plants, public sentiment is the same. "We're going to build all the first new plants at existing power plant sites," he said. "I'm very optimistic. In my view, the local population is going to be very supportive and is not going to have an issue that would cause the new plants not to be built."

In the 1960s and early 1970s, ANS played a major role in the licensing of the current fleet of nuclear power plants, Colvin noted. "The nuclear expertise resides in the industry," he said. "All of our scientists, engineers, and technical people that are involved are the heart of the society. In the early days, those people were called upon to support the society, and they were very active in supporting it. Recently, however, this hasn't been the case because new plants haven't been built."

Colvin said that he remembers being visited by various ANS presidents over the years when he was with NEI, and each one would have a different agenda for what they intended to do while in office. Then came Don Hintz, ANS's 2007–2008 president, who established ANS's Utility Integration initiative to get utilities more involved in the society. Since then, for continuity's sake, each of the succeeding presidents—Bill Burchill, Tom Sanders, and now Colvin— has agreed to maintain society programs and activities in a continuum.

ANS has to be viewed as the "go-to" place for independent scientific and technical input, Colvin said. "ANS can't be political, and it shouldn't be," he said. "ANS's views can be heard by the policymakers, but they should be independent views."

Colvin thinks that there is an opportunity to ratchet up the involvement of ANS's local and student sections. "I go to local section meetings and ask the attendees when was the last time they invited the city's mayor. It usually turns out that the

mayor was never invited, nor were the local officials or the newspaper editors," he said. "They should be invited, not to twist their arms on something, but to put a positive face on the industry."

1948 (Nov) - Joe Colvin's father to re-marry (to Gladis Gardner)

Joseph Frederick Colvin's father, also Joseph F Colvin (born 1920), remarries in November 1948 to Gladis Garder . Full page : [HN00L8][GDrive]

Tulsans' Son to Wed Fellow City Slicker

HOLLYWOOD, Nov. 29—(AP)—Gladis Gardner and Joseph F. Colvin, both members of Spike Jones' City Slickers group of entertainers, will be married here on New Year day.

The bride's identical twin sister and partner, Gloria, will be maid of honor. The groom's parents, Mr. and Mrs. S. W. Colvin, are expected to fly from Tulsa, Okla., for the wedding. The bride resides here with her parents, Mr. and Mrs. Lyman K. Gardner.

Networks Chiefs View Outlook for Next Year

Continued from 3rd Page

(on Broadway) he figures he should have an Oscar for every appearance . . .

GOLDENSON — There will always be room for first-rate comedy as there is for first-rate adventure or action or any kind of show . . .

Q.—Any chance for the return of drama on a regular basis?

GOLDENSON — The success of the Untouchables is leading us toward documentary drama in the hour form, such as the new hour-long Naked City and the Roaring 20s. Also, hour dramatic series with exotic backgrounds in the manner of Adventures in Paradise — on tap are Hong Kong, Surfside 6 and the Islanders. We also have plans for a half-hour dramatic series with Bill Orr of Warner Bros. as host . . .

AUBREY — I would love to see live drama return to CBS. As it is, the major dramatic specials such as the Du Pont series and some special Playhouse 90s are on the schedule. Also, there are plans for GE Theater to do six hour programs as well as its half-hour dramas.

COURTNEY — Hallmark Hall of Fame is planning at least two two-hour dramas — "Macbeth," to be made in Scotland, and "Show Boat." There will be other dramatic specials and the possibility of a return of Omnibus with its occasional dramas. We're adding Barbara Stanwyck's half-hour dramatic series to the schedule next year.

Q—What of public information shows?

AUBREY — We plan more than ever before — and in prime time. We will do at least 26 CBS Reports. We're moving Face the Nation to Monday nights.

GOLDENSON — John Daly will do at least one special news report a month next season in prime time, interrupting regular programing . . .

COURTNEY—Our primary plan is for the new hour Meet the Press on Saturday nights for the eight weeks preceding the convention. World Wide 60 and special reports will continue . . .

Q—What do you believe is the most significant change in regular TV programing?

COURTNEY — Possibly the drop in favor of the musical-variety program. Still, we feel that Dinah Shore and Perry Como may regain their popularity. They will be back . . .

GOLDENSON — TV moves in cycles—as does the entire entertainment world. We at ABC want to be ahead of these cycles . . . as does the entire entertainment world. We at ABC want to be ahead of these cycles . . .

AUBREY — Networks need to be masters of their own houses, to supervise closely the programs that go over their channels—to insure that such events as the quiz scandals cannot happen again . . .

And what does all this mean to the casual TV observer?

It would seem to me that television after the year of the special is leaning more and more toward routine programs. The outlook is rather bleak at the moment — but there's many a TV slip between spring and fall.

Father - Joseph Frederick Colvin (born 1920)

Born May 20 1920 ; Died August 23 1987 (age 67) in Malibu, California. See [HL002F][GDrive]

[HL002G][GDrive]

The Wikipedia Page for 🔵**Spike Jones and his City Slickers** (Saved version, see [HK0016][GDrive]) lists ***"Joe Colvin***" as a prominent band member (and trombonist) in the 1940s.

See [HW001N][GDrive]

*This Midwesterner began his professional music career on the USO circuits during the second World War, backing up the likes of **Jan Savitt** and **Frank Sinatra**. When peacetime came, he started teaching music, but left this sedate environment to become one of the **City Slickers**, under the direction of **Spike Jones**. He stayed with the group from 1947 through 1952, and was part of the "milkshake band" that came into power once Jones decided he'd reached his limit with alcoholic sidemen. Other players who were enlisted in the band as part of this new regime included Roger Donley on bass and tuba, drummer Joe Siracusa, saxophonist Dick Gardner, and pianist Paul Leu. This version of Jones' band was solidly into pranks, some of which were choreographed into the show and others that happened as a total shock to some. Colvin's mastery of the fine art of trombone techniques hadn't quite prepared him for responsibilities as a City Slicker, which included rigging his pants to fall down and come back up in synchronized time to sound effects he was making on the trombone. Most of Colvin's musical responsibilities were related to executing various parts of the arrangements, with little solo space. In fact, his only nightly solo was a four-bar spot during one of the numbers that featured a female vocalist. Colvin's ability to execute this solo spot properly was, in his mind, badly hampered by the fact that sitting next to him on the bandstand was the grinning, obnoxious banjo player Freddie Morgan. Whatever Morgan decided was the appropriate thing to play on banjo during a trombone solo, Colvin didn't like it. He wound up having to bribe the banjo player to lay off during the solo. The two players arrived at a nightly fee of one dollar. The arrangement was Colvin had to lay the dollar bill on Morgan's music stand. Then, when the trombone solo came up, the banjo player would instantly stop his plinkety-plunking. When the trombone solo was over, the banjo would come back in. Acknowledged as a skinflint when it came to financial matters, leader Jones perhaps took pity on the trombonist having to shell out bucks from his own pocket in order to clear up the solo space. When Jones created a polka project in the early '50s, he factored in a lot of solo space for the low horns of Colvin and Donley, perhaps a bit of a polka payback for the payouts. Colvin played on many of the elaborate and amusing Jones recordings from this period, including "Morpheus," "Dance of the Hours," and the band's satire of "Ghost Riders in the Sky."*

*Colvin also worked in the band of self-described mambo king Perez Prado. **After the '50s, the trombonist retired from the music business, going first into a restaurant franchise and then into a succesful nursery.** He was married to **Gladys Gardner**, one of Jones' Slickettes.*

I think this video has Joe Colvin on trombone - https://www.youtube.com/watch?v=I1583adUqSg .

Mother - Carol Culp (April 11 1921 to July 25 2015)

See [HL002E][GDrive]

***Carol Culp Colvin Hatch**, 94, passed away in total peace in her home in Santa Fe on Saturday, July 25, 2015, as the dawn broke over the Sangre de Christo Mountains. **Carol was born on April 11, 1921, at the Culp family ranch in the panhandle of Western Oklahoma, nearest the prairie territory now called Elk City**. Growing up on the ranch and then in the town of Drumright, Oklahoma, she later attended Oklahoma A&M, now Oklahoma State University. She had a distinguished **career in California as a professional musician and later as a theologian**. In her music career, she played the marimba and had the pleasure of working for the Disney Studios and playing in the Disney orchestra on some of the classic Disney movie themes and scores. Even up to the time of her passing, she continued to play her marimba in her home for friends, awing them on her ability to handle four mallets at a time. **She later became associated with Drs. Ernest Homes, Norman Vincent Peale and William Hornaday and studied their teachings as a practitioner at the Founders Church of Religious Science in Los Angeles**. In 1984, she was awarded an honorary Doctor of Humane Letters degree for her studies and contributions to the church. Carol was very involved in charitable activities, serving as the president of the Junior Women's Club in California, supporting charitable organizations in California and also involved in raising major contributions to national organizations such as March of Dimes and American Cancer Society. Carol loved automobiles, mainly her 1974 Porsche "Blue Bird" which she drove on the freeways of Los Angeles for more than 14 years. She was so enamored by cars that when she was going on her first trip to Europe, her only expressed wish was to visit the Porsche, Mercedes and BMW factories, although Vienna turned out to be her most beloved city. Carol was a wonderful and gracious person whose smile lit up a room and whose optimism and positive attitude enveloped everyone she met. Carol was preceded in death by **her parents C.P. Culp and Edna Culp**, her younger brother Charles Culp, her first husband Joe Colvin and her second husband, Earl Hatch. **She is survived by her son, Joe Colvin and wife Bunny, her son Kerry Hatch, her daughter-in-law MaryKate McGeehan, her grandchildren, Melissa Colvin Mann and husband Chris Mann, Robert Colvin and Katy Hatch and her great-grandson, Devon Mann**, her special friends Barbara Hefner and Claudia Monteiro and her many other treasured friends in Santa Fe. Carol will be buried at Forest Lawn, Hollywood Hills, next to her husband Earl Hatch in a private family ceremony. [...]*

Stepfather - Earl Hatch

See [HX000H][GDrive]

Historical Analysis

When Earl Hatch was born, it was in Greely, Colorado on August 24, 1906. He grew up in a musical family and was surrounded by the arts in everything that he did and that his friends and family did. He started as a percussionist at 6 years old. He played snare drum and trap drummer, which I am assuming to be drum kit, or accessories for the Theater Orchestra at age 10. He was extremely talented and really could make anything out of not much. The first time that Hatch played marimba for a solo piece was with the pit orchestra at the local theater. That is really, where his performance lifestyle began. Actually, during a performance, he was not holding onto his mallet very well and let it go. The mallet hit one of his audience members between the eyes and created a name for himself in the newspaper. They called him, "Dead Eye, the Mallet Slinger".

At age 15, Earl Hatch started to learn piano, all different styles, but what he was very good at was jazz. He went on the road with a six piece jazz band as their pianist. As he grew up, he learned more and more about percussion and the capabilities that he had to make beautiful music. I do not know where he attended college, but I am guessing that he studied composition because he went on to write over 600 published pieces of music. He wrote so many solos and arrangements that he did not know what to do with them. Hatch created his own private library. After his death, on November 5, 1996 in North Hollywood, California, he left his private collection to some close friends and family who finished publishing his compositions and making them available to the public. Just before he passed away, Hatch was given an Honorary Doctorate of Music in February 1988. Dr. Hatch was 90 years old when he passed away and because of all of his great accomplishments, his compositions still stay and are being played by musicians everywhere. Dr. Hatch helped bring up so many great professional players all over the United States.

While Dr. Earl Hatch was still alive, he accomplished a great deal, other than just writing a multitude of percussion pieces. He played with Walt Disney percussion, the management jobs, and played and managed at other movie companies as well. He even designed his own personal bass marimba. This sound can be heard specifically in the originals of "Dr. Zhivago", "Sound of Music", and "The King and I". A bass marimba is a smaller version of a marimba, it only has 1-2 octaves, but the wood that it is made of is either quarter saw wood, mahogany, or ash. These marimbas can be made by almost anyone, many instructors with their own private studio have either bought one, or made their own. Many of these instruments are formed into a fan shape. To be able to reach all 10 notes and still play with accuracy, that shape seemed to make the most sense. This marimba is truly one of a kind and it is very hard to properly construct or even play with a good sound, but it is possible. Dr. Hatch was even a Honorary Member of the Japan Xylophone Association.

Dr. Hatch was even a part of expanding the marimba size. He helped conceptualize that if we want lower notes, then we need bigger bars, which means we need bigger resonators. The project of helping with marimba designs was very exhausting for Hatch, but he remained teaching and educating future musicians to become great people and do great things with their life, as he did with his.

When S. Kumada helped take over Dr. Hatch's publication business, he created a website to help get the word out about his pieces. He now supervises the EHP Publication music handling shops at the address he posted. "Earl Hatch Publications 5008 Auckland Avenue, North Hollywood, California 91601". However, right now, there are only 150-200 marimba solo pieces assumed to be existing in the library.

3. William Henry Gates III (born 1955)

Saved Wikipedia (2020, Oct 22) - "Computer Center Corporation"

[HK003G][GDrive]

This small Washington state company offered time-sharing on a PDP-10. Its customers included Bill Gates and Paul Allen.[1]

Nicknamed C-Cubed, this company was founded in 1968 and closed in 1970.[2][3]

Misc

Two other companies, both based in New Jersey, used similar names.

Chapter 3 “THEY ARE ALREADY AMONG US”

[...] Tom and Monique began moving farther and farther west to escape the chaos and constraints of the Old World—first to Montreal, then to a junior faculty position for Tom at the Massachusetts Institute of Technology. By that time he and Monique had three sons and a daughter. **An assistant professor at MIT earned an annual salary of $2,400, so money was tight. Tom heard about an opening for a staff scientist at Boeing. He and Monique flipped a coin. Boeing won, and they piled the four kids in the car and began the drive to Seattle. Tom reported to work, and Monique got a job at the University of Washington.**

It’s hard to tell if Rona ever actually used his engineering degree at Boeing, at least in the sense that he never designed a bomber or missile. Officially he was a senior scientist. Defense contractors like Boeing charge the government an extra fee beyond the basic materials and labor it takes to build a B-52 or an air-launched cruise missile. This money goes into an account for preparing bids and proposals (B&P, in defense contractor jargon), which Boeing used to pay for most of Rona’s salary.

The idea was that Rona would develop new ideas for using military hardware—hopefully, new Boeing hardware. In any case, Rona effectively had a license to look at any technology or topic that seemed interesting and was a potential market for Boeing. It was almost as good as being a professor at a major university, if not better.

People were still trying to assimilate the lessons of World War II when Rona arrived at Boeing. The war was just ten years past, and everyone was still trying to figure out the legacy of what Winston Churchill called the “wizard war”—the contest of electronic weapons and countermeasures.

The British had learned the hard way just how complex this game could be. **Electronic warfare had become a critical factor in World War II during the Battle of Britain.** In 1940 émigrés who had escaped the Continent told British intelligence that the Germans had developed some kind of “beam” weapon. At first the Brits thought this might be a ray gun that could shoot down aircraft by electronically frying their ignition systems; the refugees had talked about the Germans’ testing a “beam weapon that stopped cars.”

[...]

In the 1960s a new technology began to drive the Seattle economy: computers. Up to then, computers were scarce and expensive, and could only run one program at a time. **Then in 1957 a young mathematics graduate student named John McCarthy proposed a revolutionary idea: time-sharing, or having a single computer run several programs simultaneously.** This completely changed the computer business and, by extension, Seattle.

McCarthy, who was visiting MIT on a fellowship at the time, observed that the slowest part of a computer system is always the person operating it. We work at human speed; the computer works at electronic speed. The computer requires just milliseconds to run a typical calculation. McCarthy, later a distinguished professor in computer science at Stanford, realized that if you can collect computer jobs from many users, the computer can electronically rack-and-stack the jobs as they arrive, perform the operations as capacity becomes available, and thus run more or less continuously. 3

A Teletype—a typewriter that transmits a different electronic signal for each character in the alphabet—made it possible to do all this from miles away. The basic idea for the Teletype had been kicking around since 1909, but it was not until 1931 that the Bell System had introduced it into computers.

It did not take long for some early entrepreneurs to put all the pieces together and see a business opportunity. One could buy a computer, hook users into it with Teletypes, and sell portions of the computer’s capacity to companies that couldn’t afford to buy their own.

Time-sharing became popular at universities, which typically had two or three large computers located somewhere on campus, and tens of thousands of faculty and students who wanted to use them. So it was little wonder that many of the people who tried to get into the timesharing business were college staff, like Monique Rona.

By then Monique had expanded her repertoire from oceanography to computer science. Soon she found herself running the university’s computer center. Tom helped with the financing and Monique got together with some university colleagues to buy a Digital PDP-10. They set up the Computer Center Corporation—C-Cubed, for short—in an office near the campus. Monique put a Teletype on the kitchen table, and they were in business.

[...]

Boeing published Rona’s monograph in the summer of 1976 as a “think piece” for company staff and customers. Tom Rona was the first person to use the term “information war” in print. Considering that the Internet was still thirteen years away and a “home computer” was something you built from a box of components with a screwdriver and a soldering gun, it was not a bad piece of prognostication.

Computer Firm Formed

A new computer firm, the Computer Center Corp., has been formed by four University of Washington specialists, it was announced today.

Carl G. Young, director of operations at the university's computer center since 1965, has resigned to become president of the new company, which will specialize in service to scientific firms and industries on a time-sharing basis.

Quarters have been leased in the former Dresslar-Waesche Building at 4057 Roosevelt Way N. E.

Dr. David B. Dekker, who has been faculty director of the University Computer Center since its establishment, is vice president of the new firm.

DEKKER will serve in a consultant capacity during the school year and continue on the university faculty as an associate professor of mathematics and graduate-program adviser in computer sciences. He has resigned his position with the University Computer Center.

C. G. YOUNG

DR. D. B. DEKKER

Richard G. Hamlet, chief systems programmer at the University Computer Center, and Monique R. Rona, chief scientific programmer at the center, have resigned their university positions to join the new firm.

A fifth incorporator is Richard L. Wilkinson, formerly Northwest sales manager of the Digital Equipment Corp.

TIME-SHARING of the capabilities of large, fast and complex central processors will be the principal mode of operation of the corporation, Young said.

The company plans to sell computer time via common-carrier lines from teletype machines or other electronic typewriter devices situated in customer offices.

The user will be able to communicate data directly to the computer and receive almost instantaneous reply in his own office.

The Computer Center Corp. plans to be in operation about November 1.

Westside S & L Leads July Gain

Westside Federal Savings & Loan Association in July led a local reversal of the usual July trend toward a decline in net savings.

Net savings rose only $200,000 last month in the 23 associations affiliated with the Seattle League of Insured Savings Associations. Westside, a member of the association, registered a gain of $433,000.

In 1966, when there was a tight money situation comparable to this year, league institutions suffered a July loss of $6.7 million.

Moore-Rane Buys Interest In Computer

Kenneth J. Bush, president of Moore-Rane Manufacturing Co., has announced the purchase of an interest in Computer Center Corp. of Seattle, Wash.

Moore-Rane Co. is a Corvallis-based firm which manufactures irrigation equipment, aluminum castings, and aluminum products for aircraft and automotive industries. It also produces cast aluminum products for electrical and marine operations. Recently the company started to produce houseware and giftware products.

Bush noted that this development program for the firm emphasizes further expansion of company interest.

Computer Center Corp. is engaged in the business of providing time sharing computer services and "batch" processing. Time sharing is a relatively new field in the computer services industry. It is designed particularly for those customers who require instant answers to problems and who cannot afford or do not wish to purchase or lease their own computers. It also offers an alternative source of computer service to those customers that already have their own computers.

The general classes of customers to whom the company will offer its services are engineers, architects, statisticians, state, federal, and local planning agencies, manufacturing businesses and schools and colleges.

The management of Computer Center Corp. consists of persons who were formerly on the staff at the University of Washington Computer Center. This list includes Carl G. Young, president and director; David B. Dekkar, vice-president, treasurer and director; Monique R. Rone, secretary; Richard L. Wilkinson, sales manager; Richard G. Hamlet, supervisor of systems programing and Robert E. Brine, consultant.

do with computers," Allen said. "It was a vast area of knowledge we were trying to absorb. . . . Bill and I always had big dreams of what we could do with computers." While Allen liked to read magazines like Popular Electronics, Gates read the business magazines that came into his family's home. As a prelude to doing business in the "real world," Gates and Allen formed the Lakeside Programmers Group, along with two of their friends, Richard Weiland and Kent Evans. Weiland and Allen were in the tenth grade, while Gates and Evans were in the eighth grade. The Lakeside Programmers Group was dedicated to finding money-making opportunities to use The Machine in the real world.

"I was the mover," Gates said. "I was the guy who said, 'Let's call the real world and try to sell something to it.' "

As it turned out, the real world called them first. And what a deal it was—all the free computer time they wanted.

Founded by four University of Washington computer experts in the fall of 1968 with the backing of several Seattle investors, Computer Center Corporation was a private Seattle firm offering the largest concentration of timesharing computer power on the West Coast. The company (which Gates referred to as "C-Cubed") had leased several computers from Digital Equipment Corporation, including a PDP-10 like the one Gates and the other Lakeside students used.

Computer Center Corporation attempted to sell its timesharing services to scientific and engineering businesses in the region—or any other customer in need of computer power at an affordable price.

One of the firm's founders and chief scientific programmer, Monique Rona, had a son in the eighth grade at Lakeside—the same grade as Gates. She knew about the school's teletype machine and its deal with General Electric for computer time. A representative from her company contacted Lakeside to inquire whether the school would be interested in making a similar arrangement with Computer Center Corporation. The students would have an even greater opportunity to learn about computers, the representative argued.

Lakeside concurred, and once again asked parents to help pay for the computer time used by their sons.

Gates and some of the other boys soon discovered all kinds of "neat" programs hidden in the C-Cubed PDP-10 software— **programs they had not encountered with the General Electric computer**. One trick the boys learned was something called "detach and leave job running." This meant that even though they were logged off the system, the machine was still working on their program . . . and keeping a record of the computing time used. Computer bills soon ran into the hundreds of dollars.

"These kids were very hungry for time," recalled Dick Wilkinson, one of the partners who organized Computer Center Corporation. "Every time we would get a new version of software, they would go poking around in the system, and we would have to forgive some bills because they would be running programs they were not supposed to. They found chess on the system, when they should not have. So they would play a half game of chess, and then leave the Lakeside terminal and go off to class or something. They didn't understand they were using computer time like it was going out of style."

The electronic mischief eventually got out of hand. Gates and a couple other boys broke the PDP-10 security system and obtained access to the company's accounting files. They found their personal accounts and substantially reduced the amount of the time the computer showed they had used. They were quite proud of this ingenious accomplishment—until they got caught.

Wilkinson drove out to Lakeside for a talk with Fred Wright, the math teacher in charge of the school's computer project. Like naughty boys, Gates and the others were marched into the principal's office.

Paul Allen version of Bill Gates / Paul Allen intro to C cubed :

Notes:

1. No mention of Monique Rona at all, anywhere in the book ... he should have known... big detail to omit !!!
2. Makes case that they (paul allen and bill gates) are very very smart

[...]

Within a month [in September 1968], we'd run through the Mothers Club's budget for computer time for the year, so they allocated a little bit more. In early November, as computer blackjack began to pall, **I got news from Harvey. A time- sharing company had opened in Seattle's University District. It needed people for acceptance testing of its new- model leased computer, a Digital Equipment Corporation PDP- 10.**

The next night I asked my father to take me to the Computer Center Corporation, a ten-minute drive from our home. I peered through the plate glass, into a room that never went dark, at the mysterious puppy in the window: a black mainframe with cabinet after cabinet and panels of blinking lights. The CPU alone was about five feet wide. It was the first time that I'd seen an actual computer in the flesh, and it seemed not quite real that such a thing could exist just forty blocks from where I lived. All I wanted to do at that moment was log on, connect, and have at it.

Today's average laptop is thirty thousand times faster than the machine I was lusting after, with ten thousand times more memory. But in its day, the PDP- 10 was the most advanced species of an evolutionary alternative to the batch- processing establishment. Founded by Ken Olsen and Harlan Anderson, DEC made its first splash in 1960 with the PDP- 1, the first truly interactive, "conversational" computer. **Less than a decade later, the PDP- 10 became the mainstay for the Defense Department's ARPANET (the original Internet) and a time- sharing workhorse.** It ran faster than GE's system at Lakeside and had a broader software repertoire, including FORTRAN and other languages, plus a rich array of online utilities.

Fortunately for me and my fellow Lakesiders, this wonderful hardware all relied on a new operating system, TOPS- 10, that was apt to crash whenever it served too many users at a time. **Computer Center Corporation (which we'd call C- Cubed) had taken delivery of its leased PDP- 10 in October 1968, with a plan to start selling time in the New Year. In the meantime, their TOPS- 10 needed to be debugged before the paying customers arrived. As an added incentive for C- Cubed, its lease payments would be deferred until the software functioned reliably. The company needed somebody to push the system to its limit, which was where we came in.**

One C- Cubed partner was a Lakeside mother who'd heard about our little tech fraternity. A few days after my sneak preview, Fred Wright ushered us into the building to make introductions. A resident guru laid out the deal: We could have unlimited free time on their terminals, off-hours, as long as we abided by their ground rules. "You can try to crash the computer," he said, "but if it crashes from something you do, you've got to tell us what you did. And you can't do it again until we tell you to try."

The following Saturday, we met in the C- Cubed terminal

The Gary Kildall version :

see Gary Arlen Kildall (born 1942) / Gary Kildall's book "Computer Connections" (1994)

Notes:

1. Ridiculous scenario that company found Gates and Allen
2. This narrative sort of paints Gates and Allen as capable, but that they were being used as tools
3. Kildall definitely claiming turf - that the computer center was HIS friends

The Computer Center Corporation

I mention the Computer Center Corporation, or C-cubed, as it was called, because it predicated an interesting series of events involving Bill Gates, Paul Allen, and myself.

Dick Hamlet, Monique Rona, Carl Young, director of the UW Computer Center, and my undergraduate professor David Dekker started C-cubed. It was one of the first timesharing computer companies in Seattle and used Digital Equipment Corporation's DEC PDP-I Os. C-cubed, located near the UW, was in business for only a short time and folded.

C-cubed depicted the mentality of the late sixties. No one wanted to manage punched cards, nor did they wish to wait at the operator's door in favor of a sampling of program output. Instead, timesharing became the watchword. Remote access to the B5500 sparked Dick, Monique, and David's interest in creating the Ccubed business.

There were two kids from Lakeview High School who broke into Dick's DEC PDP-IOs and stole passwords. This way, they could hook up to Dick's computers from a remote teletype and use it for free. The two kids were Gates and Allen.

[OK - What are the odds that one of the company's FOUNDERS just happen to be a classmate and a computer-club-mate of Bill Gates / Paul Allen, who were the two kids who "hacked" the passwords? Remember .. they had only been using computers for a few weeks !!!!]

Don't vilify Gates and Allen for this activity. Breaking in was not that hard. It was like stealing candy from the comer computer store. And, it was theft of the very basic sort.

Dick was one of the best systems programmers I had ever run across, and it didn't take him long to discover the theft of time on his machines. He found the culprits and cleverly allowed Gates and Allen access to C-cubed, so that he could recode and test the operating system to help prevent illegal access.

Dick explained how Gates and Allen did it. It's fairly simple. They "logged-in" to his DEC PDP-10 system from a remote location using a valid account and password. A sample limited account was given to Lakeview students by C-cubed, mostly through Monique's interest in the school. Well, the DEC PDP- I 0 used virtual memory that swapped RAM to disk. This left data in memory pages that were given to other programs. Dick's machine wasn't heavily used, so most of memory had operating system data structures like passwords, still lying around in memory. Gates and Allen just dumped "pages" of reassigned memory to their computer terminal and watched for things that looked like passwords. Once they found a few. they simply used them at no cost to themselves. The reason that I consider this theft is that I, even being a very good friend of both Dick and Monique, could not afford to pay C-cubed timesharing charges, although, I sincerely wished to do so.

Dick found the Gates and Allen scam when a customer complained about a bill for services when, in fact, no services were rendered. He fixed it by zeroing memory pages when they were swapped out and released. That took extra computer time but stopped the banditos.

I was attending the UW then. I noticed a couple of kids programming at C-cubed one day. They were Gates and Allen. I ran into them then, and again several years later.

Stephen Russell version

1. It was al Monique Rona who found the kids
2. Doesnt speak super highly of the kids.. more or less of a cute story

[...]

Kossow: All these vertically stacked platters.

Russell: Yeah. That was not as reliable as was desirable. But the main struggle was we just didn't get enough business. And so eventually they went out of business. And at that point, I guess I had annoyed DEC sufficiently that they thought maybe I would be useful in marketing. And so I started working for Digital.

Kossow: There's the one little story that you had a couple of testers up in Seattle.

Russell: Oh yes, yes. We did have a testing program. Was it TOPS-10 by then? I'm not sure. **At any rate, the multi-user operating system for the PDP-10 was not a paragon of reliability. In fact, it started out with a pretty dismal mean time to failure. And so we had a couple of people working on basically fixing, full-time, fixing bugs in the operating system. And there was no real lack of bugs to fix. Monique Rona had— was one of the principles, and her son was going to Lakeside School. And so she arranged that we could— we give some time to the Lakeside School who had got a teletype**. And we also had built a training room which had six or eight terminal teletypes in it. And what we would do is on Saturdays especially, we'd open that up to the Lakeside students to come in and load test the computer. We wanted lots of people. And the rules were, you can do anything you want, you can try to break the system if you want. But if you do manage to break the system, you've got to tell us what you did and don't do it again until we tell you. And this was quite fruitful. We collected heavy load bugs this way. And two of the students were Paul Allen and Bill Gates. And they had to be admonished several times about the "don't do it again until we tell you" part of the rules. But they certainly had a great deal of fun and they evidently learned quite a bit.

Kossow: You remember anything in particular that they did?

Russell: No. They asked lots of questions. And one of the things that we would do at Saturdays was, Dick Gruen or I or somebody would be in the terminal room, or periodically stick our nose in the terminal room, make sure that the pandemonium was under control, and answer questions."

[...]

monique Rona version (from that book)

See Monique R Rona (born 1929)

1. Yea Bill gates and paul allen were smart, but Monique was totally in control

By then Monique had expanded her repertoire from oceanography to computer science. Soon she found herself running the university's computer center. Tom helped with the financing and Monique got together with some university colleagues to buy a Digital PDP-10. They set up the Computer Center Corporation—C-Cubed, for short—in an office near the campus. Monique put a Teletype on the kitchen table, and they were in business.

The PDP-10 had just hit the market. Being a new machine, it was prone to electronic burps and hangfires. The C-Cubed partners thought they might cut a deal where Digital would give them a discount on the computer if they worked out the bugs.

As it happened, one of the Rona boys attended the Lakeside School, a local private academy, and had heard of some classmates who liked to work with computers. **Some of the Lakeside moms had bought their kids a Teletype and a few thousand dollars of computer time from local companies with money raised from a rummage sale.** The moms hoped their kids might learn a few computer skills writing programs to play ticktacktoe and the like.

[Several THOUSAND dollars in 1960s is a lot of money]

The kids had other ideas. They began playing with the Teletype day and night, taking apart programs and writing some of their own. In no time they burned through the computer time their mothers had bought them and had to look for some new benefactors, **just when Monique was looking for some eager minds to test her PDP-10**. The boys cut a deal with C-Cubed: the boys would look for bugs in the PDP-10, and C-Cubed would give them some time on its computer.

Two of the kids, Bill Gates and Paul Allen, seemed to have a knack for computers. When the machine crashed, they would fetch the "core dump" from the trash and search through the machine language line by line to find the bug. They wangled operating manuals from the staff. Eventually the "Lakeside Programmers Group" came to know the insides of the PDP-10 about as well as C-Cubed did. So, when they ran out of their allotted time on the machine, they naturally took the simple expedient of fiddling with the computer's operating system to set back the clocks. Bill, Paul, and their Lakeside buddies Ric Weiland and Kent Evans were four of the earliest computer hackers. 4

Alas, the market for computer time-sharing never worked out as well as Monique had hoped, and C-Cubed eventually went broke, another case of roadkill on the path to IT riches. Gates and Allen went on to other ventures. **One was a new company, "Micro-Soft," which they incorporated in April 1975 to sell programs for the Altair 8800, the first personal computer.**

[HK004H][GDrive]

George Conrades is the former Chairman of the Board and Chief Executive Officer of [**Akamai Technologies, Incorporated**]. Prior to Akamai, Conrades served as CEO of [**BBN Technologies, Incorporated**]. Before joining BBN he spent 31 years at IBM, running its U.S. and Asia-Pacific businesses and heading two manufacturing and development groups.[3]Mr. Conrades currently serves on the Board of Directors of Oracle Corporation,[4]. He has also served on the Boards of Ironwood Pharmaceuticals[5] and Harley-Davidson.[6]

Conrades was also an executive producer of the 2013 documentary film 20 Feet from Stardom, which won the 2014 Academy award for Best Documentary.[8] He is a Fellow of the American Academy of Arts and Sciences.[9] He is married to Patricia "Patsy" Belt Conrades.[10]

Career

Conrades spent his childhood in Youngstown, Ohio, during the 1950s. He planned to become a drummer.

In 1961, he received his B.S. degree in Physics and Mathematics from Ohio Wesleyan University, and received the M.B.A. from the University of Chicago Graduate School of Business in 1971.[9] He was going to join a rock band after his graduation, but took the position of a sales representative in Big Blue, Columbus, Ohio[*citation needed*].

After 10 years at IBM, Conrades got a sales management position in Chicago and inherited the company's fifth largest account, Sears, Roebuck & Co.

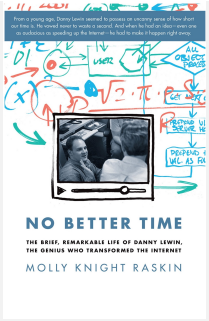
In 1971, he entered for the Executive MBA Program North America at Booth. The program provided broad perspectives of business.

The MBA helped Conrades to make a good career at IBM. He took top management positions at IBM for more than two decades. Conrades advanced to the rank of senior vice president and member of the Corporate Management Board. But by late 1980s, IBM faced contest in technological businesses. In 1992, Conrades left his top management position.

Conrades formed a technology consulting firm in the advanced R&D company Bolt, Beranek and Newman (BBN). The company was based in Cambridge, Massachusetts. BBN became an early internet service provider.[11]

1939 to 1990 : Early life and career : From 2013 - "No Better Time" by Molly Knight Raskin

PDF - made from recording, with OCR - [HB005L][GDrive]



[HB005K][GDrive]

Pages 167 - 172 in OCR copy :

- [...] Conrades first laid eyes on a computer as a student in math and physics at Ohio Wesleyan University. Conrades, who graduated from the university in 1961, was then somewhat of a star on the university's campus. Handsome and charismatic, he served as president of both his fraternity and the student body.
- He played the drums in a rock 'n' roll band, which he described as "full of testosterone," and spent a lot of time in the physics lab trying to blow things up. But Conrades was also a standout student with a gift for both math and physics. So when the head of the school's math department decided to offer a computing course, Conrades signed up. Before he knew it, he'd learned to program one of IBM's earliest models, the 650. In his day, Conrades said, "No one had even heard of computers." With a love for motorcycles, hot rod cars, and "anything that moved," Conrades said that he took one look at the colossal machine with its blinking red lights and rotating magnetic drum and fell in love. With its relatively low cost and ease of programming, the 650 was marketed as a teaching computer to science and engineering schools across the country. Conrades became so skilled at programming that, before he graduated, some of the faculty members at Wesleyan approached him with a list of computer companies, including IBM, Honeywell, and NCR (National Cash Register Company). "They told me that I should interview at every one of them, and that I should be in technical sales," Conrades remembered. "I told them that I really wanted to make it as a rock star."
- Reason prevailed, however, and Conrades landed an entry-level job at IBM, which by the 1960s had burgeoned into a $1 billion business. Conrades began as a systems engineer, and at the same time earned an executive MBA from the University of Chicago School of Business. Over the course of 31 years, he rose up through the ranks at IBM to become senior vice president of IBM North America, a $24 million business. In 1992, after a dispute with then-chairman of IBM John Akers, Conrades left the company. By 1994, he had become president and CEO of BBN Technologies, formerly Bolt, Beranek, and Newman, the technology and research fmn that helped build ARPANET. When Conrades joined BBN, the company was a think tank that survived on government contracts. Conrades leveraged the tremendous brainpower at BBN to transform the company into one of the world's largest Internet Service Providers. In 1997, GTE Corporation purchased BBN for $616 million, or $29 a share, more than double the stock's value when Conrades came aboard. **But the corporate culture of GTE didn't agree with Conrades, and after a year spent as the president of GTE Intemetworking, he left and took a year off work for the first time in his career.** Conrades could have comfortably retired, but he soon realized that slowing down was not for him, or his wife, Patsy, whom he met in college. "One day, I opened the freezer and suddenly everything was falling out-chicken and steak all over the place," recalled Conrades. "And Patsy looked at me and said, 'George, stay out of my freezer. And get a job."' The fact was, Conrades had spent too much time at the forefront of the digital age to sit on the sidelines of the dotcom craze. He wanted to play a part in the next big thing, so he looked to venture capital, which he said was raising its head in anticipation of the digital gold rush. **In August 1998, he joined Polaris.**

Epilog by David Walden

[...] The first section of this epilog continues from the point of Steve Levy's section 6.6 discussion of BBN in the 1990s. That section, which starts on page 116, sketches the BBN transitions from the arrival of George Conrades as BBN CEO until the 1997 sale of BBN to GTE.1 The second and third sections of this epilog provide a more general picture of how BBN changed between 1997 and 2010.2

this epilog provide a more general picture of how BBN changed between 1997 and 2010.2

22.1 Changes in ownership

BBN under **George Conrades** as president and CEO invested heavily in expanding the market share of its Internet business, **BBN Planet**. This was in the era of the dot com boom. **In time the need for continued investment in BBN Planet resulted in the sale of BBN to the telephone company GTE which wanted to be in the Internet business.** In the two years following GTE's June 1997 acquisition of BBN, GTE continued to operate BBN Systems and Technologies (the contract R&D business) and BBN Planet as separate businesses, investing over $1 billion in growing BBN Planet.

In the spring of 1999, as part of the continuing consolidation and evolution of the communications industry, GTE and Bell Atlantic announced that they had agreed to merge their two companies (in other words, Bell Atlantic acquired GTE). However, Bell Atlantic was one of the Regional Bell Operating Companies (RBOCs) that resulted from the historic breakup of AT&T Corporation and was forbidden under the terms of the breakup from being in the "long-distance service" business. BBN Planet's Internet business was deemed to be a long distance business by the Federal Communications Commission; consequently, prior to effecting the merger with GTE, Verizon had to relinquish control of BBN Planet.3 **Verizon accomplished this divestiture of control by allowing BBN Planet to sell $2 billion of its shares in the public market. The resulting public company was named Genuity. 4**

At the time of Genuity's IPO in the summer of 2000, BBN Technologies5 continued to operate under its own name as a wholly owned business unit of Verizon Communications. Then in February 2004, BBN Technologies became a privately held company again, having been acquired from Verizon by private investors (primarily Accel Partners of Palo Alto, California, and General Catalyst Partners of Cambridge, Massachusetts) and the management of the company. In October 2009, the 2004 investors cashed out of their investment, selling BBN to Raytheon for $350 million.6

22.2 The classic BBN culture and business

Not surprisingly, when **George Conrades** came to BBN as CEO, he brought in new senior managers (see Figure 6.11) with skills he didn't see in traditional BBN managers, many of whom had come up through the technical side of the company. In particular, the position of Frank Heart (see https://en.wikipedia.org/wiki/Frank_Heart) had as president of BBN Technologies was taken over by **David Campbell** (https://en.wikipedia.org/wiki/David_N._Campbell) who came from an executive position outside of BBN.8 Campbell brought in additional key managers from outside BBN, reorganized BBN Technologies, and in general worked on redirecting BBN Technologies's business in ways he thought appropriate.

[See The President's Commission on Critical Infrastructure Protection (PCCIP) ..

"AUG 25, 1997", Clinton also appointed Charles R. Lee, chief executive officer of GTE Corp. of Stamford, Conn., David N. Campbell, president of BBN Technologies of Cambridge, Mass., and Elvin Moon, president of E.W. Moon Engineering & Construction Management Industries of Los Angeles, to serve on the team advising the President's Commission on Critical Infrastructure Protection (PCCIP). "]

When BBN was acquired by GTE in June 1997, David Campbell became a senior executive of the GTE Technology Office, managing GTE Laboratories and a few other GTE held activities, and still personally managed BBN Technologies. Campbell did the job he was assigned and tried to fit BBN Technologies into the GTE culture and organization.

As a result of such reshaping—and the prior emphasis within BBN from 1995 to 1997 on exploiting BBN's Internet activities and changing BBN Technologies' business direction—BBN Technologies' traditional research and development business suffered. Many good researchers and managers left, and for several years the company did an insufficient job of recruiting the potential stars of tomorrow.9

Nonetheless, a number of influential BBN Technologies old timers (and an influential consultant) were committed to preserving the "classic" BBN culture and business. They were able to convince David Campbell that BBN Technologies needed its own dedicated leader. In the first half of 1998 a committee consisting of one long-time, senior BBN person and two outside people who knew BBN Technologies' traditional strengths undertook a search for a dedicated leader of BBN Technologies.

Ed Starr, who had joined BBN in 1959 and was serving as part of Campbell's top management team, was chosen to be president of BBN Technologies. Starr was well known and respected throughout the company, having worked as a project leader and business leader in many capacities all around the company. However, Starr was planning to go to half-time work the next year and was thinking about full retirement. Starr agreed to serve as president for 18 months; and Tad Elmer was designated as Starr's successor.

Elmer also had been on the search committee's list, but he had never run a companywide activity. Elmer was a department manager who had been with BBN for many years and also was well known and respected throughout the company. Elmer had demonstrated entrepreneurial capability, having initiated a new branch office and moved his department into new business areas, particularly at the intersection of BBN's involvement with computers and acoustics. Elmer worked closely with Starr, watching and learning.

Ed Starr did cut back his hours (and eventually retired), and Tad Elmer became president.10 With Starr and then Elmer at the helm, BBN Technologies began to reassert its traditional culture and approach to business (and financial viability).

By the time of the Bell Atlantic acquisition of GTE and the spin off of Genuity (what had previously been called BBN Planet), the BBN Technologies business and culture had already been substantially reinvigorated.

Verizon did not try to integrate BBN Technologies into the rest of its business. Instead it treated BBN Technologies benignly, and there was mutual respect between Verizon and BBN Technologies. BBN did do a little bit of work for Verizon, but generally BBN's technologies were in too far from being off-the-shelf products to be useful to Verizon.

During the almost four year it was part of Verizon, BBN Technologies flourished in its classic business. Visiting BBN during that period, I heard one-time BBN colleagues of mine say that is was like the old BBN again—perhaps better.

In 2003 Verizon needed to change its capital structure in preparation for a big investment in FIOS and began looking for buyers for parts of the company not central to its future, including seeking a buyer for BBN Technologies. Worried about coming under the control of another owner not interested in the classic BBN business, Tad Elmer and his management team were given permission by Verizon to seek investors who would make an equivalent financial offer to keep BBN Technologies what it was; and they found such investors.

The sale, primarily to Accel Partners of Palo Alto, California, and General Catalyst Partners of Cambridge, Massachusetts, happened in March 2004, and was celebrated within BBN Technologies and by retired BBN people who retained a strong emotional attachment to BBN classic business continuing to

flourish.

Of course, the outside investors wanted BBN to make money for them. Thus, as had happened so often in BBN's past,11 there was pressure once again to license technology and to create products in addition to pursuing the traditional contract research and development business. This time BBN Technologies tried to be particularly quick and nimble and to take advantage of the contacts of the venture capitalists who were its major investors.

A new division was created for the licensing and product opportunities led by Alex Laats who came from outside the company with entrepreneurial, licensing, and venture capital experience. Between 2004 and 2009, several product opportunities were pursued. Some examples are:

- PodZinger12 audio and video search engine
- AVOKETM system and services to examine telephone interactions from the caller's perspective
- Boomerang sniper detection localization system
- Digital Force Technologies (acquisition of a company with specialized manufacturing capabilities)

Boomerang is an representative example. This system detects incoming smallarms fire and displays the azimuth, range, and elevation of the shooter; it can be installed on a vehicle in an hour. Based on BBN Technologies' prior acoustics and computer technology experience and development work, in 2005 DARPA awarded BBN Technologies a contract to prototype this system. BBN completed a set of prototype systems in 65 days. Eschewing the approach BBN had used sometimes in the past of setting up its ownmanufacturing activity, BBN Technologies outsourced manufacturing for Boomerang with BBN engineers working closely with the engineers of the a contract manufacturer to modify the design for productization, reliability, and manufacturability. In 2006 the Army ordered over 100 systems, and through 2008 there were additional procurements totaling approximately 10,000 units.

Some of the other projects, for example, Podzinger and Avoke, benefitted from the connections of the ventures capitalist owners of BBN.

Over the same period, BBN Technologies grew and expanded its traditional research and development activities, in combination with the aforementioned product activities.

By the time of the sale of BBN Technologies to Raytheon in late 2009, BBN Technologies had doubled its yearly revenue, tripled its yearly profit, and paid off the debt resulting from the leveraged buyout from Verizon.

22.3 The evolution continues

The day before my April 1, 2010, interview with Tad Elmer and Steve Milligan, I studied the BBN Technologies website, bbn.com, to try to understand how the areas in which BBN Technologies does research and development had changed since most of the chapters in this book were drafted in 2003. Looking under "technologies" on the website, I found the following categories:

- Advance Networking
- Cyber Security
- Heathcare Informatics
- Immersive Learning Technologies
- Information and Knowledge Technologies
- Sensor Systems
- Speech and Language Technologies

Each of those areas listed between 5 and 30 subareas. While I could see some overlap with what I knew from 2003, much was different.

Tad Elmer explained that he believes in rearranging existing technical groups and adding new groups with fair regularity—to pursue new technology opportunities, especially at the intersections of previous technology areas where innovation so often happens.13 Furthermore, long-time areas of BBN expertise have expanded. For example, Elmer explained that the sensors and detection area (see Chapter 10) has expanded to detection using any sensor media (for example, sound, infrared, magnetism) to look into or through any sort of substance; and speech and language technology leaders John Makhoul and Ralph Weischedel already hinted (see Chapters 14 and 15) at expansion in their area. There also has been expansion in other areas.

I asked Elmer and Milligan if there were any principles that guide the ongoing evolution of BBN Technologies and development of its people. Milligan said that the senior technical leaders (the "principle investigators" who represent the company technically to customers and mentor the relevant technical people) are allowed to move in any direction they want as long as: (a) it is legal and ethical; (b) someone outside the company is willing to pay for the work; and (c) the work is generally fun and interesting for the people at BBN. Elmer said that point b can slightly dominate point c if the contract is big enough.14

Such flexibility not only is allowed; it is encouraged. Some senior people who did not enjoy change and moving into new areas and ways of organizing have left the company.

One can't know for certain how BBN Technologies will change as a consequence of its purchase by Raytheon. However, given the company's 62-year history as a preeminent innovator, one can assume that Raytheon and BBN Technologies will work hard to keep this powerful national resource working in its traditional way in an ever evolving set of problem areas.

Notes and References

1. Some of the information in this chapter came from Steve Levy's work on Chapter 6. Steve Blumenthal and Harry Forsdick providing confirming details on the Genuity-to-Level 3 transition in e-mails of April 3, 2010.
2. This information came from an interview of BBN Technologies president Tad Elmer and chief technology officer Steve Milligan at BBN in Cambridge, Massachusetts, on April 1, 2010, and from an e-mail of June 27, 2003 from Ed Starr.
3. GTE's ownership of BBN Planet had not had a "long distance" problem because GTE had not been an RBOC.
4. Verizon retained an option to convert, under certain conditions, the 10 percent ownership it held after the sale of the equity into a 90 percent ownership position in Genuity. Between 2000 and 2002, Genuity continued to invest heavily in its growth, and annual revenues grew to in excess of $1 billion. Nevertheless, after a cumulative investment approaching $6 billion, Genuity was still incurring heavy operating losses; and, in the fall of 2003, Verizon announced that it was not going to exercise its option to convert its 10 percent equity position in Genuity into a 90 percent ownership position. Given its heavy, negative cash flow Genuity was then forced to file for bankruptcy under Chapter 11 of the U.S. bankruptcy laws. In early 2003, Level 3, Inc., acquired the operating assets and business of Genuity for something on the order of $200 million.
5. Somewhere along the line, the "Systems and" part of the BBN Systems and Technologies named was dropped.
6. The 2004 purchase price has never been publicly disclosed, but the 2009 sale price purportedly produced a nice profit for the investors, especially in a time of generally poor economic results.
7. See Chapter 7.
8. Conrades himself led BBN Technologies for over a year, in addition to his many other duties, until he was able to bring Campbell on board.
9. See the discussing of recruiting in section 5.2.

10. Around the same time David Campbell left GTE.
11. See Chapter 6.
12. The system's name was later changed to RAMP.
13. Also, several years earlier BBN's business related to ship quieting had been sold to Raytheon, thus eliminating that part of the company's historic business.
14. In mid 2012 Tad Elmer retired from BBN. According to the bbn.com website, Ed Campbell is now president. At the time of his appointment as president, Ed had been with the company for 34 years and had been Tad Elmer's deputy for many years.

BBN shares rocket 49% after firm inks AT&T pact

By Jeff Glasser
CONTRIBUTING REPORTER

Bolt Beranek & Newman Inc. shares jumped by 49 percent yesterday after the telecommunications services company said it will join with AT&T Corp. to provide companies with a broad range of Internet services.

Under the terms of the partnership, BBN will help AT&T customers set up, operate, protect and maintain dedicated, leased-line connections to the Internet, while AT&T's 12,000-member sales staff will market BBN's products and technology.

The agreement is expected to generate at least $120 million in revenue over three years for BBN Planet Corp., Bolt Beranek's Internet services subsidiary, officials of the two companies said.

BBN and AT&T will begin offering services in selected (but undisclosed) markets on Aug. 1, and nationally on Sept. 1.

"Our customers will benefit from the synergy between AT&T and BBN," said Tom Evslin, AT&T vice president of Gateway Services. " ... Together, we'll make the Internet as much a part of modern business as the telephone today."

Analysts said they expected BBN stock to continue its upsurge for a week to 10 days, with little or no effect on AT&T stock. BBN closed at 27⅝, up 9⅛. The analysts said BBN's strong showing reflected shareholders' happiness with the deal since it fulfills basic needs on both sides.

"AT&T pacifies the customers who had clamored for some type of Internet

BBN, Page 43

BBN shares leap after firm inks AT&T pact

■ BBN
Continued from page 41

service immediately, BBN gets the marketing expertise and access to AT&T's huge customer base," said Yankee Group analyst Stephen Franco, who follows the telecommunications service industry.

Until the announcement, AT&T had been slow to tap into the Internet marketplace – a policy which had drawn widespread criticism.

Analysts said AT&T chose BBN because of its role in developing effective and reliable security for businesses on the Internet, particularly large Fortune 500-scale companies.

BBN, based in Cambridge, has been a leader in creating "public private virtual networks," which protect companies doing business on the internet by encrypting information so that only authorized parties can access information.

"We're like the ADT of the Internet," BBN chief xecutive and president George H. Conrades said.

The public private virtual network system which BBN has developed can best be explained by the following example: A pharmaceutical company wants to communicate with 35 hospitals through the Internet. So on behalf of the pharmaceutical company, AT&T and BBN create public private virtual networks to set up communications between the 35 hospitals. BBN and AT&T encrypt the company's information to the same key for the hospitals and then transmit the communication. Upon transmission, the encryption keeps a regular Internet user not affiliated with the hospitals from reading the communications because the data transmitted comes out transparent.

BBN will spend the next few months consolidating its business and laying the foundation for thousands of new clients courtesy of AT&T. The company already laid the groundwork for such an expansion when it purchased several regional access providers in the Southeast and West.

The moves should help the firms expand their 5 to 6 percent market share against competitors PCI and UUNET, which already have a partnership agreement to work with Microsoft's powerful network.

For AT&T, yesterday's announcement could just be the beginning of a slew of moves designed to sketch out and implement a clear strategy for the Internet.

Microsoft planning on-line gambit with World Wide Web

By Jim Erickson
Seattle Post-Intelligencer

SEATTLE — Shouldering for the first time into the fast-growing market for Internet software, Microsoft said last week it would adapt programs being created for its planned on-line service to the World Wide Web.

Microsoft has been developing a set of proprietary software tools, code-named "Blackbird," for exclusive use of companies creating content for its Microsoft Network. The company is also creating consumer software called "viewers," which work in conjunction with the Blackbird technology, for Microsoft Network subscribers.

But the explosive growth of the World Wide Web as an on-line publishing venue and as a popular alternative to closed on-line services persuaded Microsoft to alter its proprietary on-line service strategy and climb onto the Web.

"We needed to figure out ways to make money (on

Microsoft Chairman Bill Gates said Internet access will be available through Microsoft Network next month.

BBN ready to come into its own

By Laurence Zuckerman
New York Times

CAMBRIDGE, Mass. — Bolt Beranek & Newman has been the Forrest Gump of high technology, playing an obscure but crucial role in many key events since its founding in 1948 by two professors and a graduate student from MIT.

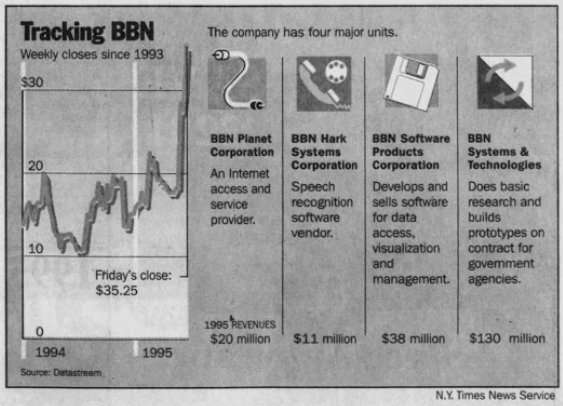
But recent deals have put the company in the spotlight, and it now seems poised to cash in on the enormous growth of the Internet.

Bolt Beranek & Newman, which is changing its name to BBN, designed the first modem, chose the @ symbol to address electronic mail and built the now-legendary Arpanet, the original computer network from which the Internet evolved.

But until recently other companies took its inventions and turned them into multimillion-dollar businesses.

"We were a company whose time had come, and yet we didn't have a presence," said George Conrades, the chief executive. That has changed. Under the leadership of Conrades, who was forced out of the top ranks of IBM in 1991 after 31 years with the company, BBN has committed itself to profiting from its own invention. BBN has received a strong en-

See Pioneering, D5



N.Y. Times News Service

Pioneering BBN ready to cash in on Internet

Continued from D1

dorsement when AT&T Corp. agreed to buy a minority stake in BBN Planet, a subsidiary that is the largest provider of Internet access and security services to corporations and institutions.

The two companies concluded a partnership agreement by which BBN Planet will provide a broad array of Internet services to AT&T clients on an exclusive basis starting in September.

Meanwhile, BBN's Hark Systems subsidiary also is on a roll. Its speech-recognition software, originally developed to help intelligence agencies eavesdrop, has been licensed by IBM to be included in a hardware and software package that automatically answers and directs large numbers of calls.

These deals have sent BBN's stock surging. After the alliance with AT&T was announced on June 20, BBN shares rose 49 percent in one day, to 27⅝. Since then, they have risen another 2 percent, closing Friday at 34¼, up 2⅜ on the New York Stock Exchange.

Not a bad performance for a company that has lost money for the last two years and has seen its annual revenue shrink to $200 million last year from a high of $300 million in 1988.

Most analysts predict that for the fiscal year that just ended on June 30, BBN will register another loss and revenue will remain flat.

Those numbers reflect the company's reliance on government research and development contracts, which have accounted for two-thirds of revenue. While government cutbacks have made such contracts more scarce, BBN has been investing in new management to develop its three commercial subsidiaries.

In addition to BBN Planet and Hark, the company owns BBN Software Products, which makes data analysis software used by manufacturers and pharmaceutical companies.

"A management that had profitability in the next three months as its goal would probably be the wrong management for BBN at this time," said Lee Allen, president of Allen Financial Advisors in Boston, who has been following BBN for more than two years.

"It's a topsy-turvy way of looking at a company, but it is the right way to look at BBN now."

BBN's first contract came in 1948 to consult on the acoustics for the U.N. General Assembly hall in New York. Later, it was hired to analyze a recording of gunshots by a congressional committee investigating the assassination of President John F. Kennedy and by a second committee to analyze the famous 18-minute gap in the Nixon White House tapes.

After buying the very first minicomputer produced by Digital Equipment Corp. in the 1960s, BBN invented packet switching, in which a message is broken into discrete pieces that are transmitted over telephone lines and then reassembled at their destination.

That technology forms the basis for the modern networks that enable communication between computers and made the Internet possible.

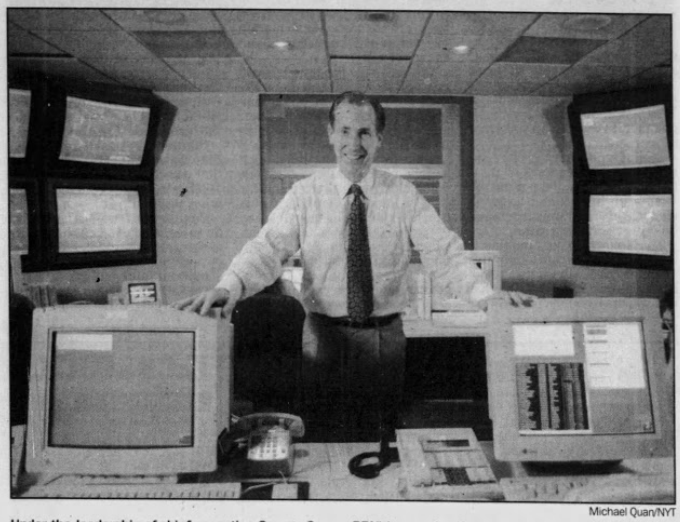
The company boomed in the 1980s, growing 25 percent a year, fueled by heavy military spending and a business building packet-switching networks for government agencies and commercial clients like Delta Air Lines, Mastercard and Procter & Gamble.

But the sharp cuts in military spending of the last decade sent the company into a tailspin, and BBN's management responded by moving to commercialize more technology.

A company called Lightstream was formed to sell a packet switch developed by BBN. Steven Levy, BBN's chairman, approached Conrades, who had already left IBM, about joining the board.

"As I started to work with George, I saw what an incredible talent he really was," Levy said. As he pondered the changes to be made at BBN, Levy realized that the best course would be to combine BBN's technological prowess with Conrades' marketing expertise. "And the only way I was going to pull that off was to give him my job," he said.

Conrades became chief executive in January 1994. Most companies must finance their research from product sales, he said, but at BBN, the research arm is self-supporting. That, in turn, supports the company's commercial efforts as well as promising a steady stream of opportunities.



Michael Quan/NYT

Under the leadership of chief executive George Conrades, Bolt Beranek & Newman (soon to be called BBN) has put itself in the spotlight recently and seems poised to cash in on the Internet's growth.

And by establishing independent subsidiaries, BBN has attracted a core of talented executives from companies like EDS, Oracle and Dun & Bradstreet by giving them equity stakes in their company's success.

Conrades came under fire in December when he decided to sell Lightstream to Cisco Systems for $120 million; BBN's stock fell 25 percent the day the deal was announced.

Conrades defended the decision by saying that Lightstream required millions of dollars to set up a distribution network. Instead, he said, he was convinced that BBN should use the proceeds of the sale to expand its Internet access and software businesses.

GTE's Charles Lee gestures as he announces purchase of BBN Corp., whose chairman George Conrades, right, flanks two other GTE executives.

GTE buys BBN for $616m

Deal for Internet pioneer puts firm ahead of AT&T, MCI

By Joann Muller
GLOBE STAFF

Stepping up an aggressive strategy to challenge nationwide telephone carriers, GTE Corp., the nation's largest local phone company, yesterday agreed to buy Internet pioneer BBN Corp. of Cambridge for $616 million in cash, or $29 per share.

The announcement came one day after GTE said it would pay $485 million for part of Qwest Communications Corp.'s nationwide fiber-optic network. The back-to-back moves enable GTE to offer a broad array of telecommunications services to consumers and businesses throughout the United States.

"Our goal is to be the first player to truly deliver local, long distance, Internet access and enhanced data services, all on a nationwide basis, all from one company, all on one bill, and all with a single point of contact for customer service," GTE chief executive Charles R. Lee told analysts.

The company, which is moving its headquarters from Stamford, Conn., to Dallas, also said it was teaming up with Cisco Systems Inc., a San Jose, Calif. networking company, to help manage its network and could buy more than $1 billion of Cisco products over five years.

Lee said the moves would pay off long-term for GTE shareholders, but cautioned that the heavy up-front investments would hurt short-term profits. He estimated that 1997 per-share earnings growth would be "flat to slightly positive," instead of the 10 percent earnings growth that had been expected before the moves were announced. The company said earnings could increase 13 percent to 15 percent a year starting in 1999.

GTE shares fell 1⅛, to 45, while BBN leaped 6¼, to 28⅞, on the New York Stock Exchange.

Under terms of the deal, which has been approved by directors of both companies, GTE will begin a cash tender offer for all BBN, Page D2

GTE Corp.
Headquarters: Stamford, Conn.
Chairman/CEO: Charles R. Lee
Founded: 1918
Employees: 102,000
Stock: Down 1 1/8 to 45 on NYSE
Core business: Provides local telephone and mobile-cellular services to customers in 29 states, Canada, the Dominican Republic, and Venezuela. Also publishes telephone directories and supplies command, control, communications, and intelligence systems to US Department of Defense.

BBN Corp.
Headquarters: Cambridge
Chairman/CEO: George H. Conrades
Founded: 1948
Employees: 2,000
Stock: Up 6 1/4 to 28 7/8 on NYSE
Core business: Builds wide-area communications network systems. Also develops and markets packaged data analysis software products and performs contract research and development in computer, communications and acoustics.

NOTE : George Henry Conrades (born 1939) in the photo

D2 THE BOSTON GLOBE • WEDNESDAY, MAY 7, 1997

From sound of things, BBN helped pioneer 'Net

By Hiawatha Bray
GLOBE STAFF

GTE Corp.'s $616 million investment in BBN Corp. will buy it a lot more than a major Internet service provider. In a sense, BBN is *the* Internet service provider, the company that constructed the ARPANET, the first primitive computer network that has grown into today's global web of data. Many companies, universities and government agencies collaborated to build the Internet, but no one participant is more closely identified with the project than BBN.

Yet when the company was founded as Bolt, Beranek and Newman in 1948, it wasn't involved with computers. Instead the company's specialty was acoustics – the study of sound. BBN designed the acoustics for the great hall where the United Nations General Assembly meets. And the company still does a great deal of sensitive work for the US Navy on ways to make surface ships and submarines quieter and harder to detect.

Given BBN's relationship to the Pentagon, it's easy to believe the popular story that the Internet was developed to ensure that military computer networks could survive a nuclear attack. But Frank Heart, who worked on the ARPANET for BBN, says the story is bogus.

Instead, the Internet grew out of an effort in the 1960s to allow computers at universities and research institutions to communicate with each other. BBN's involvement with the project began in the late 1950s, when the company hired a brilliant psychologist named J.C.R. Licklider.

"He was with the company only a matter of months, and he said, 'I want a computer,'" recalled Leo Beranek, cofounder of BBN.

"I asked what is it going to cost. He said $30,000. I said: 'My God, man, we've never bought anything more expensive than a water cooler. What are you going to do with it?' He said he didn't know but he knew that computers were the wave of the future."

Beranek got Licklider his computer, one of the first minicomputers from Digital Equipment Corp., and Licklider began hiring smart, ambitious students fresh from Harvard and MIT, and turned BBN into a center for computer research.

"BBN was thought of as sort of the third university. People would go from Harvard to MIT to BBN," said Katie Hafner, author of "Where Wizards Stay Up Late," a history of the Internet.

In 1962, Licklider left BBN to take a job at the Pentagon's Advanced Research Projects Agency. There he established the program that would eventually lead to the creation of ARPANET.

But it wasn't until 1969 that construction of ARPANET began. The goal was to connect computers at four major universities. BBN won the contract to attempt it – and they succeeded.

Even though the computers were connected, there wasn't a simple way to send messages. A BBN engineer named Ray Tomlinson solved the problem in 1972 by inventing electronic mail.

Now BBN is one of a handful of major firms that run the Internet's "backbone," the major communication lines that carry Internet traffic.

GTE buys Cambridge's BBN Corp. for $616m

■ BBN
Continued from Page D1

outstanding shares of BBN for $29 a share.

In acquiring BBN, GTE instantly acquires an Internet network that would have taken two years to build, said David Goodtree, an analyst with Forrester Research.

"That gives them a two-year jump" on competitors such as AT&T Corp. and MCI Corp., which are also scrambling to provide customers with Internet service.

And BBN, which created a forerunner of the Internet 28 years ago, is attractive to GTE because it has established customers and "a golden name," Goodtree said.

Building off of BBN's Internet base, GTE, with 1996 sales of $21 billion, expects to add $5 billion to $8 billion in revenues over the next few years, officials said.

GTE's purchase of BBN is a blow to AT&T, because BBN has been providing Internet access to AT&T's business customers since June 1995.

AT&T spokesman Mike Miller said the deal with BBN was a short-term solution and that AT&T has always intended to move its customers to its own Internet backbone, which is now in place.

The two companies are negotiating an end to the contract, but neither Miller nor BBN chief executive George Conrades would comment on the talks.

It had been widely rumored for more than a week that AT&T was about to buy BBN. Those rumors helped lift BBN stock from 15¾ on April 21, to 22⅝ on Monday, the day before the GTE deal was announced.

Yesterday's deal with GTE overshadowed the release of BBN's third-quarter results, which showed revenues of $95.9 million, about 58 percent higher than a year ago, and an operating loss of $12.1 million.

Much of the revenue growth was due to growth in BBN Planet, BBN's Internet services division, which had revenue of $48.2 million, up 134 percent from a year ago. Nearly half that revenue came from helping America Online Inc. expand its network to meet rising demand.

CONSOLIDATED FINANCIAL HIGHLIGHTS ▪

(Millions of Dollars, Except Per-Share Amounts)	1997	1996	% Change
Revenues and Sales	$23,260	$21,339	9.0
Operating Income	5,611	5,488	2.2
Net Income*	2,794	2,798	(.1)
Earnings Per Common Share*			
Basic	2.92	2.89	1.0
Diluted	2.90	2.88	.7
Common Shareholders' Equity	8,038	7,336	9.6
Average Common Shares Outstanding (in millions)	958	969	(1.1)
Return on Common Equity	37.6%	40.2%	–
Capital Expenditures	5,128	4,088	25.4
Access Minutes of Use (in millions)	79,640	70,452	13.0
Access Lines (in thousands)	27,670	25,766	7.4
Employees (in thousands)	114	102	11.8

* Costs associated with the new data initiatives reduced net income by $242 million, or $ .25 per share in 1997. Excluding these costs, basic earnings per share from core operations would have been $3.17. The 1996 results include a pretax gain of $12 million, which increased net income by $8 million, or $ .01 per share, in connection with the program to sell or trade a small percentage of nonstrategic domestic local-exchange telephone properties. Excluding this gain and the costs related to the new data initiatives, net income would have grown 8.9% while earnings per share would have grown 10.1%.

ABOUT GTE ▪ With 1997 revenues of more than $23 billion, GTE is one of the world's largest telecommunications companies and a leading provider of integrated telecommunications services. In the United States, GTE provides local service in 28 states and wireless service in 17 states, nationwide long-distance service and internetworking services ranging from dial-up Internet access for residential and small-business consumers to Web-based applications for *Fortune* 500 companies, and video service in selected markets. Outside the United States, the company serves over seven million telecommunications customers. ▪ In addition, GTE is a leader in government and defense communications systems and equipment, directories, telecommunications-based information services, and aircraft-passenger telecommunications.

GTE WE'RE NOT JUST YOUR LOCAL TELEPHONE COMPANY ANYMORE ▪ Featured on the cover and throughout this annual report is a constant stream of information, flowing from GTE customers who live and work around the world. Have an idea? Let us move it for you.

[HC004U][GDrive]

PRODUCTIVE ▪ GTE provides over 13,000 Boeing Company employees with dial-up Internet-access service and offers a fast integrated services digital network (ISDN) system to promote telecommuting. We also helped to configure and install a private Central Office telephone switching system. GTE is bidding on customizing a wireless headset system that will allow jet aircraft assemblers to communicate with suppliers – and each other – across the factory floor more efficiently, boosting productivity and quality in its plants in Washington and Kansas.

INTERACTIVE ▪ GTE enables Purdue University in West Lafayette, Indiana, to use a special PictureTel™ system to conduct interactive distance learning, videolinking faculty and students at other campuses to increase office hours and the quality of education. GTE also meets other Purdue communications needs from basic phone service to trial ADSL Internet access and a managed switching facility on the campus, which serves 36,000 students and 12,000 faculty and staff.

BEFORE THE
ARKANSAS PUBLIC SERVICE COMMISSION

MAR 9 1 36 PM '99

FILED

IN THE MATTER OF THE APPLICATION OF GTE COMMUNICATIONS CORPORATION FOR A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY TO OPERATE AS A FACILITIES BASED PROVIDER OF INTEREXCHANGE TELECOMMUNICATIONS SERVICES WITHIN ARKANSAS) DOCKET NO. 99-058-U

APPLICATION

COMES NOW GTE Communications Corporation (hereinafter referred to as "GTE" or "Applicant") pursuant to Arkansas Code Annotated § 23-3-201, et seq., and Rule 7.06 of the Arkansas Public Service Commission ("Commission") *Rules of Practice and Procedure* and respectfully requests the Commission to issue a Certificate of Public Convenience and Necessity ("CCN") authorizing Applicant to operate as a facilities based provider of interexchange telecommunications services within the State of Arkansas. In support of its Application, GTE states as follows:

1. In accordance with Rule 7.06(a), the name and address of Applicant is :GTE Communications Corporation, 6665 North MacArthur Boulevard, Irving, Texas 75039-2443.

2. Pursuant to Rule 2.03(b) of the Commission's Rules of Practice and Procedure, Applicant requests that the following person be shown on the Official Service List:

Lawrence E. Chisenhall Jr.
Chisenhall, Nestrud, & Julian P.A.
400 West Capitol, Suite 2840
Little Rock, AR 72201

3. Applicant is a subsidiary of GTE Corporation. Applicant is a Delaware corporation having been incorporated on November 30, 1988 as GTE Interactive Services Incorporated. Applicant's name was changed to GTE Card Services Incorporated and, subsequently, applicant conducted business under

1

the name GTE Long Distance. On July 28, 1997, Applicant's name was changed to GTE Communications Corporation. Applicant is authorized to do business in the State of Arkansas as a foreign corporation. A copy of Applicant's Articles of Incorporation are on file in Docket No. 95-187-U. A copy of Applicant's Certificate of Amendment and Application for Amended Certificate of Authority from the Arkansas Secretary of State are attached hereto respectively as Exhibits 1 and 2.

4. In Docket No. 95-187-U, this commission issued a CCN authorizing Applicant to operate as a reseller of interexchange telecommunications services within the State of Arkansas.

5. A list of officers and directors of GTE, as required by Rule 7.06(a) is attached hereto as Exhibit 3. A description of the qualifications of certain of its officers is attached as Exhibit 4.

6. Applicant has access to ample experience, technical means and capital to develop its network and is financially capable of providing reliable, safe and adequate facilities based interexchange telecommunications services within the State of Arkansas. Information with respect to its financial ability is contained in Docket No. 95-187-U and a copy of GTE Corporation's most recent Form 10-K is attached hereto as Exhibit 5.

7. Applicant seeks amended certification and authority to provide intrastate facilities based interexchange telecommunications services in Arkansas. Applicant seeks to provide interLATA and intraLATA voice message, data transmission and ancillary long distance services over its own or leased facilities or in combination with its own or leased facilities and on a resale basis. Such services will include direct dial switched access on a prescheduled basis in those areas where available and in other areas on a 10xxx basis.

8. GTE has a price list on file with the Commission and, except as may be necessary to clarify that services are not exclusively provided on a resale basis, is not proposing changes at this time in

2

connection with this application.

9. Pursuant to Rule 7.06(g) the following information is provided regarding Applicant's proposed transmission facilities, switching equipment, the points at which such facilities and equipment will connect to other telecommunication carriers' networks, and a description of the type of access service to be used to connect such facilities and equipment to the local exchange carrier networks:

> A) Applicant seeks authority to operate as a facilities based carrier of interexchange services. Applicant may construct a private, high-speed, high-capacity fiber network. This high capacity fiber backbone route may be established by lease and construction and will connect Applicant to appropriate local exchange carriers, including its own local exchange network. The fiber network would also be connected with other telecommunications carriers where appropriate. Applicant's system would provide state-of-the-art fiber optic clarity, speed, diversity of access and reliability of service. Applicant is still determining the location of any facilities and switching points.

10. Granting this application is consistent with the public interest and will allow customers and potential customers of interexchange telecommunications services to receive high quality, reliable, interexchange services at competitive prices.

WHEREFORE, GTE Communications Corporation respectfully requests the Commission to grant its request herein and amend its Certificate of Public Convenience and Necessity to provide facilities based interexchange telecommunications services within the State of Arkansas.

Respectfully Submitted,

CHISENHALL, NESTRUD & JULIAN, P.A.
400 W. Capitol, Suite 2840
Little Rock, Arkansas 72201
(501) 372-5800

PART III

Item 10. Directors and Executive Officers of the Registrant as of December 31, 1997 (a).

Executive Officers of GTE

Name(b)	Title	Age	Date Assumed Present Position
Charles R. Lee	Chairman and Chief Executive Officer	58	May 1992
Kent B. Foster	President	54	June 1995
Michael T. Masin (c)	Vice Chairman and President - International	53	June 1995
Thomas W. White	Senior Executive Vice President - Market Operations, GTE Service Corporation	51	June 1997
William P. Barr (d)	Executive Vice President - Government and Regulatory Advocacy and General Counsel	47	June 1997
George H. Conrades (e)	Executive Vice President and President - GTE Internetworking	59	July 1997
Armen Der Marderosian	Executive Vice President - Technology and Systems	60	June 1997
J. Michael Kelly	Executive Vice President - Finance and Planning	41	June 1997
J. Randall MacDonald	Executive Vice President - Human Resources and Administration	49	June 1997
Dan J. Cohrs (f)	Vice President - Corporate Planning and Development, GTE Service Corporation	45	July 1997
William M. Edwards, III	Vice President and Controller	49	July 1997
Daniel P. O'Brien	Vice President and Treasurer	43	July 1997

(a) Reference is made to pages 22 to 26 of GTE's Proxy Statement covering the Annual Meeting of Shareholders to be held on April 15, 1998, which is incorporated herein by reference, for information concerning directors of GTE.

(b) Prior to serving as executive officers of GTE, each of the officers named has been employed in high-level management positions by GTE or a GTE subsidiary for more than five years, with the exception of Michael T. Masin, William P. Barr, George H. Conrades and Dan J. Cohrs.

(c) Mr. Masin joined GTE as Vice Chairman effective October 20, 1993. He was also elected President - International on June 30, 1995. He had been a director of GTE since 1989. Prior to joining GTE as Vice Chairman, he was the Managing Partner of the New York Office of O'Melveny & Myers and Co-chair of the firm's international practice group. Mr. Masin joined the firm in 1969 and became a partner in 1977.

(d) Mr. Barr was elected Executive Vice President - Government and Regulatory Advocacy and General Counsel effective June 5, 1997. He had served as Senior Vice President and General Counsel since 1994. Prior to joining GTE, he was a partner in the Washington, D.C. office of the law firm of Shaw, Pittman, Potts & Trowbridge since 1993. He served as Attorney General of the United States from 1991 to 1993. Mr. Barr joined the Department of Justice as Assistant Attorney General in charge of the Office of Legal Counsel in 1989, and subsequently served as Deputy Attorney General prior to his appointment as Attorney General.

(e) Mr. Conrades was elected Executive Vice President and President - GTE Internetworking effective July 9, 1997. He served as president and chief executive officer of BBN Corporation since January 1994. Prior to joining BBN, he had been employed for more than 30 years at IBM, most recently as Senior Vice President and General Manager of IBM United States.

(f) Mr. Cohrs was elected Vice President - Corporate Planning and Development, GTE Service Corporation, effective July 9, 1997. He had previously served as Vice President and Treasurer since 1995 and had been Assistant Treasurer - Capital Markets of GTE Service Corporation since June 1993. Prior to joining GTE, he had been Vice President - International Finance for Northwest Airlines ("Northwest") in Tokyo, and before that was Northwest's Vice President - Capital Markets.

Ex-PepsiCo CEO Calloway dies

By Jeff Mangum
Staff Writer

Wayne Calloway, whose basketball prowess in North Carolina led to a scholarship to Wake Forest University and whose business acumen took him to the top job at PepsiCo Inc., died Wednesday night at Memorial Sloan-Kettering Cancer Center in Manhattan after battling prostate cancer for more than six years. He was 62.

Calloway, a Greenwich, Conn., resident known both for his folksy manner and his zeal for riding a Harley, joined PepsiCo in 1967 and served as chairman and chief executive of the Purchase-based food and soft drink giant from 1986 to 1996.

"Wayne was a business leader of enormous intelligence and integrity who guided PepsiCo to great growth and prosperity," PepsiCo chairman and chief executive Roger Enrico said yesterday in a prepared statement. "He was also as warm and genuine a man as you could know. His quiet strength and friendly, soft-spoken way were endearing as well as inspiring."

Calloway underwent prostate surgery in April 1992 and told shareholders about his cancer diagnosis when they met at PepsiCo's headquarters for the company's annual meeting less than a month later.

The CEO told shareholders at the time that "the doctors say (the surgery) is a complete success. I'm feeling great and as you can see, I look great, I'm sure."

In a January 1993 interview with this newspaper, Calloway referred to his cancer fight as a learning experience. "You tend to re-evaluate where you are and realize what you're doing and get a little better understanding of who's important."

Calloway rose from humble beginnings in Elkin, N.C., a dairy and tobacco town northwest of Winston-Salem. His mother, who survives him, worked at a Hanes hosiery mill for 43 years until she lost her vision in one eye and retired with a disability; his father owned a bakery and held other jobs.

Calloway's first taste of business, ironically, was an after-school job at a drugstore soda fountain.

As a youth, Calloway joined the Boys Club, where he learned to play basketball and later won a scholarship to Wake Forest, which named its school of business and accountancy in his honor in 1995.

Calloway graduated with an accounting degree in 1959, joining Vicks Chemical Co. By 1965, Calloway was working in New York City for ITT Corp., whose legendary leader Harold S. Geneen was busy merging and acquiring companies.

For Calloway, the stint at ITT meant spending a lot of time on airplanes. "I'm not sure what we were doing," he joked in a 1991 interview, "but we were doing it in a hurry."

In 1966, a corporate headhunter named Robert Getty called about a new job. Calloway said he wasn't interested, but the calls kept coming. Finally, one day Getty said, "Calloway, you're stupid." And that got his attention.

Calloway accepted Getty's invitation to lunch, and became intrigued by the company recently formed by the merger of Pepsi-Cola and Frito-Lay. The new post of director of profit planning and control would give Calloway a chance to build a financial control system from scratch.

Please see CALLOWAY, 6B

Staff file photo
Wayne Calloway was PepsiCo's chief executive from 1986 to 1996.

Wayne Calloway

- Born: Elkin, N.C., 1935.
- Education: Wake Forest University, Winston-Salem, N.C. Graduated in 1959 with a B.B.A. degree in accounting.
- Military Service: U.S. Army, Fort Jackson, S.C.
- Career highlights: Vicks Chemical Co. 1959-64; ITT Corp., 1965-66; joined PepsiCo Inc. as director of profit planning and control, 1967. Held various posts until becoming chairman and chief executive in 1986.
- Board memberships: PepsiCo, Citicorp, General Electric Co.
- Family: Married. Four children, two grandchildren.

Calloway: Former PepsiCo CEO dies at 62

Continued from page 5B

He became a corporate vice president in 1973 and was tapped to run PepsiCo's Frito-Lay unit in Texas in 1976, returning to New York as PepsiCo's chief financial officer in 1983. He became president in 1985.

People who knew Calloway credited him for melding business savvy with a personal touch. Shortly after he became chairman and CEO in 1986, Calloway ordered workers to tear down the wall in the company gym that separated top executives from other staffers.

"Whenever I'd see him he would always make you feel welcome," said Emanuel Goldman, a PaineWebber analyst in San Francisco who knew Calloway for years. "This is a very special trait to have. No matter how high he rose in the organization — to the pinnacle — he typified the Rudyard Kipling poem, 'If.' ... He walked with kings and did not lose the common touch."

George Conrades, a former senior executive at Armonk-based IBM and now president of a GTE Corp. division in Cambridge, Mass., met Calloway as a parishioner at an Episcopal church in Greenwich. At the time, Conrades recalled, he didn't know anything about Calloway, who eventually became a motorcycle riding buddy.

> **"Whenever I'd see him he would always make you feel welcome. This is a very special trait to have. No matter how high he rose in the organization — to the pinnacle — he typified the Rudyard Kipling poem, 'If.' ... He walked with kings and did not lose the common touch."**
>
> **— Emanuel Goldman, PaineWebber analyst**

"In his typical fashion, he asked me a lot of questions about myself," Conrades said, "so I was telling him what a muckety-muck I was at IBM and all the while this guy is the CEO of Pepsi and so approachable and so interested in other people — just a wonderful guy."

Calloway had a "tremendous, pragmatic intellect," Conrades added, and was a "tremendous listener."

"He both listened and kind of talked the listener's language," Conrades said. "It made him seem like just a good fellow, but he was really helping you move the ball along with his comments and his insights."

Calloway is survived by his mother Lether Smith, of Winston-Salem, and his wife, Jan, of Greenwich. The couple's four children are David Calloway of Austin, Texas, Jennifer Calloway of New York City, Ross Smythe of Dallas and Boyd Smythe of Newton, Mass. Calloway also had two grandchildren, Ross Smythe II and Helena Smythe.

Funeral services are scheduled tomorrow at 11 a.m. at Christ Church, 254 E. Putnam Ave., Greenwich. In lieu of flowers, a PepsiCo spokesman said donations may be made to either the Calloway School of Business and Accountancy at Wake Forest or Memorial Sloan-Kettering Cancer Center in New York City.

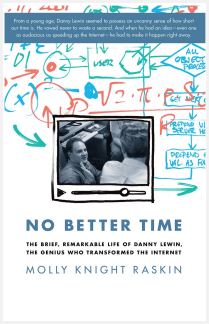
1998 (Summer time.. August ? September?) - Conrades first meets Lewin and Leighton of Akamai

Source - 2013 book - By Molly Knight Raskin - "No Better Time" ; PDF - made from recording, with OCR - [HB005L][GDrive]



[HB005K][GDrive]

That summer [of 1998], Conrades first made the acquaintance of Lewin and Leighton, agreeing to meet them at the suggestion of Battery's Todd Dagres. Conrades recalled sitting through the pitch session and thinking that, as much as he liked the idea, he was initially uncertain about Akamai's business model. "I understood what they were saying-not at the level of the algorithms-but about making the Internet feasible for e-commerce and robust audio and visual interaction," Conrades explained. "I lived the problem at BBN, even though we threw a lot of money at it. That's when I learned that you can't throw enough money at the Internet to make it work right." By the end of the meeting, however Conrades was so impressed with Akamai 's solution that he felt Polaris had a potential gold mine. He helped convince Polaris to invest in Akamai, and decided to put in some money of his own, too. According to Conrades, his investment strategy was informed by four basic elements: the idea's greatness, the technology's potential impact, the business model's strength and, most importantly, the employees' overall caliber.

For Conrades, the people always came first. As for Akamai, he had no concerns about the people. Then he considered the idea. To him, the concept of what he called an "agnostic" network-one that provided a synoptic view of the Internet-was brilliant. "It was a big idea,"

1998 (Summer) - Akamai moves into their own offices, and out of MIT

Source - 2011 (Sep 13) Interview - F. Thomson (Tom) Leighton PhD '81 / Transcript (below) - [HE003S][GDrive] (video - https://youtu.be/gWJW4TAquCI)

And so we said, the only way we're going to do this is to do it ourselves, so let's give it a try. ***So we spun out of MIT at the end of the summer of '98,*** *a year after the 50K started and got offices over in One Kendall and then called up those VCs and said, hey, we could use some money. Turned out to be harder than we thought to actually get the money on terms we wanted, so we had a period of about three to four months where we were funding it ourselves with friends and with some angels, professional angels. We had friends of friends we knew to bridge us to the first round with the VCs.*

1998 - Some time in fall (but before OCt 03) .. meaning like Sep 24th 1998, Conrades is notified of opportunity to work with ICANN

The details of the contacts with each Director are summarized below. To provide some context: As part of the creation of the consensus structure that eventually became ICANN, there was considerable discussion about how this new entity would be managed .. Since it was, by definition, intended to be a global consensus entity, it was understood by all that its management should be globally diverse. While there was considerable discussion about how the permanent Board should be constituted, it was generally understood that the Initial Board members would have to be produced by the same consensus process that-was to. create the new entity itself.

In fact, that is what happened. Simultaneously with the effort to develop a consensus organization, the entire Internet .community was invited to propose people who would be suitable as Initial Board members. At first, the general view seemed to be that the Initial Board should represent the various stakeholders in the process - those groups or coalitions that wereseparately.Identffled and had a specific Interest to advance. It quickly became clear that it was not going to be easy - and perhaps impossible - to come to a consensus using this approach, in part because the various stakeholders·showed no propensity for coming to consensus on their particular · representative, and in part because it was difficult to perceive a consensus on which stakeholder groups should be represented on the Initial Board. The focus then changed to finding what were referred to as •1uminaries•- peopleo f outstanding credentials and reputations who had not been engaged in the debates and whom the Internet community would recognize and support as both qualified and neutral.

The Initial Board as it now stands is the result of that latter effort, which was engaged in by numerous people around the world. In addition to volunteered proposals, Jon Postel and IANA affirmatively sought out recommendations from the full range of participants in the debate, including NSI. A number of people who seemed to be attractive candidates were approached in various ways and declined to be considered; others who were recommended seemed inappropriate for a variety of reasons. After considerable discussion, the current roster of Initial Board members was finally reached. The original suggestions of those people who ultimately came to serve on the Initial Board came from private. individuals, business organizations, trade associations, and officials of various governmental organizations. The final decisions on who would be invited were made by Jon Postel, after considering all the advice and recommendations received and coming to a judgment that this group of individuals was likely to receive consensus support from the Internet community. The official invitations were issued on behalf of Dr. Postel by his counsel.

With that preamble, the following summarizes the details of the contacts that each individual director experienced:

[...]

2. George H. Conrades

Sometime last fall, Mr. Conrades received a call on his car phone from John Patrick, whom he knew from working together at IBM. Mr. Patrick asked him if he was familiar with IANA and the effort to form a new private sector entity to take over those responsibilities. Mr. Conrades said he was aware of the effort. Mr. Patrick then told him that his name had been suggested as a possible initial director of the entity, and asked if he would be interested; Mr. Patrick said that the Global Internet Project was supporting this effort, and that Mr. Conrades' background and experience in the industry, combined with the fact that he was no longer associated with any company, made him a particularly good choice as a knowledgeable but neutral candidate. He then suggested that Mr. Conrades call Roger Cochetti for more details, which he did, and he subsequently agreeJ to let his name be submitted to the USG. He ·then received a call from the counsel to Jon Postel, who confirmed that his name would be submitted and discussed dates for an initial meeting, which was held in October.

Internet Names Proposal Received

By ALAN M. WOLF
Bloomberg News

WASHINGTON — The U.S. government received a proposal from part of the Internet's technical community for a new non-profit organization to administer Internet addresses.

The organization would be based in California and eventually take over responsibility of Internet domain names — the .com, .org and other tags for addresses on the World Wide Web. It also will resolve issues such as trademark protection and how to dole out new names as the number of sites on the World Wide Web continues to explode.

In June, the Clinton administration gave the Internet community a deadline of Sept. 30 to hammer out a compromise on how to create the new organization. The request set off a dispute among conflicting interests over the future of the Internet's administration.

The Internet Corporation for Assigned Names and Numbers, or IANA, the main group that's been scrambling to prepare a proposal for the new body, submitted a document to the Commerce Department Friday. "These documents reflect the consensus judgment of the global Internet community," wrote Jon Postel, IANA's director, in a letter to U.S. Commerce Secretary William Daley.

Postel ran the University of Southern California research organization that has administered the numbers behind Internet addresses.

The proposal represents the interests of Internet engineers and computer scientists, domain name companies, Internet users, businesses, Internet service providers and others, Postel wrote. "This organization will be unique in the world — a non-governmental organization with significant responsibilities for administering what is becoming an important global resource."

The Commerce Department will accept comments on the proposal for at least a week, according to Ira Magaziner, Clinton's top Internet advisor. "We want consensus," Magaziner said, though he added that given the chaotic nature of the Internet, it's hard to get "100 percent consensus."

Network Solutions Inc., the company now in charge of keeping the registry of the most popular domain names, had worked with the IANA group on an earlier draft proposal, though it hasn't officially endorsed the latest version submitted to the government. The company's five-year exclusive contract to operate the registry of so-called Internet domain names, set to expire Sept. 30, was extended until Oct. 7 earlier this week.

The extension was designed to allow Network Solutions, the government and IANA work out details of the transition of oversight of domain names.

The latest proposal is a "workable" document, said Christopher Clough, a Network Solutions spokesman. The company will review the proposal and expects to file comments with the Commerce Department.

Shares of the Herndon, Virginia-based company fell 13/16 to close at 37 15/16.

The IANA group also submitted a proposed list of candidates for the new organization's first board. These candidates would serve for two years if the Clinton administration agrees they represent a broad cross-section of various Internet interests.

The proposed board members include Linda Wilson, president of Radcliffe College; Geraldine Capdeboscq, a vice president with Bull SA, a French computer networking company; George H. Conrades, a partner with Polaris Venture Partners and former GTE Corp. executive; Gregory L. Crew, chairman of the Australian Communications Industry Forum Ltd.; Esther Dyson, chairman of Edventure Holdings Inc.; Frank Fitzsimmons, a global marketing vice president with Dun & Bradstreet Corp.; Hans Kraaijenbrink, chairman of the Association of European Public Telecommunications Network Operators; Eugenio Triana, an Internet consultant; and Jun Marai, a professor of environmental information at Japan's KEIO University.

"This list is intended to be geographically and functionally diverse," said Joe Sims, a lawyer representing IANA.

The IANA proposal will be posted at www.ntia.doc.gov, the Web site for Commerce Department's National Telecommunications & Information Administration and at www.iana.org, IANA's home page.

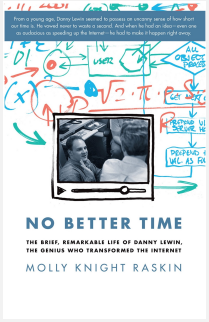
1998 (November) - Akamai secures funding with Polaris and Battery Ventures; agrees to take Conrades on as a director

Source - 2013 book - By Molly Knight Raskin - "No Better Time" ; PDF - made from recording, with OCR - [HB005L][GDrive] ; Pages 104 - 105 in OCR copy



[HB005K][GDrive]

*With the belief that the big venture money was soon to come, [**Frank Thomson Leighton (born 1956)**] signed the lease on a new office. Akamai moved from its tiny office space at One Kendall to the fourth floor of 201 Broadway in the heart of the Cambridge hub for high-tech firms. By November, everyone involved in the first-round financing rush was anxious-a deal was on the table, and it was a good one. Two prominent firms - **Battery Ventures** and **Venrock** - were ready to make an investment of $8 million ($4 million each) in Akamai. The deal was as good as done, signed, and delivered to Akamai's financial officers and attorneys for vetting. But on a Sunday, the night before the funds were to be wired into Akamai's account, Leighton's home phone rang. It was one of the general managers of Venrock. "We're sorry," he told Leighton. "We're not going to close the deal." Leighton was stunned. Venrock seemed like the perfect fit, having been an early investor in both Apple and Intel. The partner went on to explain: "I've thought hard about it, and I don't think you're going to be successful." Leighton could only think of one thing to say in response: "I think you're wrong."*

In one phone call, Akamai lost half of the $8 million they'd been promised. Lewin immediately feared a domino effect after Venrock's sudden departure. Having turned down offers from almost all the local venture capital companies, they worried no one would even consider stepping in if Battery backed out, too. ***Dagres reassured them, though, offering to close the deal if Battery could take charge of finding another investor to fill the hole left by Venrock. Akamai agreed. Their best hope was Polaris Venture Partners, which had recently recruited George Conrades, a veteran from IBM and BBN (Bolt, Baranek Newman) who had long governed the intersection of business and cutting-edge technology. Dagres contacted Polaris with a deal: if the firm would supply the $4 million Akamai needed, the company would offer Conrades a position on its board. A deal was struck, and in November 1998, just before the Thanksgiving holiday, Akamai secured its first round of financing from Battery and Polaris.***

Leighton and Lewin retained control of the company with a stake of $8 million. *Lewin took the title of chief technology officer, and Leighton became chief scientist. Seelig assumed the role of vice president for Strategy and Corporate Development. Kaplan became vice president for Business Development.*

1998 (Dec) - Conrades becomes a director at Akamai

fiscal year 2000 - https://www.ir.akamai.com/static-files/16c4fae9-fc0e-4fea-8d97-da36a2a6f888

George H. Conrades has served as Chairman and Chief Executive OÇcer of Akamai since April 1999 and as a director since December 1998. Mr. Conrades has also been a venture partner of Polaris Venture Partners, Inc., an early stage investment company, since August 1998. From August 1997 to July 1998, Mr. Conrades served as Executive Vice President of GTE and President of GTE Internetworking, an integrated telecommunication services Ñrm. Mr. Conrades served as Chairman of the Board of Directors and Chief Executive OÇcer of BBN Corporation, a national Internet services provider and Internet technology research and development company, from January 1994 until its acquisition by GTE Internetworking in July 1997. Prior to joining BBN Corporation, Mr. Conrades was an IBM Senior Vice President and a Member of IBM's Corporate Management Board. Mr. Conrades is currently a director of Viacom, Inc., a media company, and Cardinal Health, Inc., a health care company.

1999 (Jan 15) - Confirmation Conrades is a director at Akamai

WORLD WIDE WEB

New network to boost speed, quality

TONY MUNROE
REUTERS
CAMBRIDGE, MASS.

A cadre of high-wattage scientists, entrepreneurs and venture capitalists on Thursday announced the launch of a network they said will boost the speed and quality of content delivered over the World Wide Web.

The venture, called Akamai Technologies Inc., is the result of three years of development at the Massachusetts Institute of Technology's Laboratory for Computer Science.

As part of its launch, Akamai said it has received more than $8 million US in venture capital from Battery Ventures of Wellesley, Mass., and Polaris Venture Partners of Boston and Seattle.

The technology, which is still in the beta, or preliminary, stage, uses hundreds of servers linked to the Internet and deployed all over the world to bring the distribution of Web content closer to users.

Proprietary software developed at MIT drives the servers and prevents the need for a centralized distribution system, thereby easing Web traffic and boosting the speed and quality of information, said Akamai Chief Operating Officer Paul Sagan, a founder of the NY1 cable channel and the Road Runner Internet service.

MIT has licensed the technology to Akamai, for which it has received an equity stake in the company.

Akamai's service will be sold to Web content providers, Sagan said, and users of those pages will automatically enjoy the advantages of Akamai.

Akamai has enlisted 10 Web content providers to use the technology in the development stage, Sagan said. Though he declined to identify the partners, he said five of them are among the busiest on the Web.

Akamai hopes to have a revenue stream in the second half of this year, and upward of 1,000 servers deployed globally by the end of 1999, Sagan said. He said he expects that the company will need another round of financing.

Akamai, which Sagan called a "unique marriage of scientific and Internet minds," is in the process of hiring a chief executive officer.

Frank Thomson Leighton, professor of applied mathematics at MIT, led the team that developed Akamai's "content distribution network" technology.

Leighton, who has taken leave from MIT to be Akamai's chief scientist, said the technology can be used by information and entertainment providers, as well as for e-commerce and online trading.

MIT graduate student Daniel Lewin, who worked with Leighton, is Akamai's chief technology officer.

Among the ventures directors is George Conrades, a partner at Polaris Venture Partners.

Conrades was chairman and chief executive of BBN Corp., which played a key role in building the cross-country computer network that became the Internet, before it was acquired in 1997 by GTE Corp. At GTE, he was executive vice president and president of GTE Internetworking.

The word "Akamai" is Hawaiian for smart and "cool," Sagan said.

1999 (April 08) - Conrades named CEO of Akamai

Full newspaper page - [HN01FG][GDrive]

The Boston Globe (Boston, Massachusetts) · 08 Apr 1999, Thu · Page 65

Conrades named CEO of Akamai Technologies

George H. Conrades, a veteran of **International Business Machines Corp.** and **BBN Corp.**, was named chairman and chief executive of Cambridge-based **Akamai Technologies Inc.**, an Internet service start-up firm. Conrades will launch a service to solve the problem of lengthy download times for popular Web sites caused by too much user traffic across multiple networks. Akamai was founded last year by Tom Leighton, a professor of applied mathematics at MIT, and one of his graduate students. Conrades, 60, formerly was chief executive of BBN, an Internet-service provider in Cambridge that was acquired by GTE Corp. After leaving BBN, he became a partner at **Polaris Venture Partners,** a venture-capital firm in Boston that funds a variety of information technology and biotech companies. Polaris and **Battery Ventures,** a venture-capital firm in Wellesley, have contributed a combined $8.4 million to Akamai, the company said. Conrades, who is also a CBS Corp. director, said he will remain with Polaris.

Pages 167 - 172 in OCR copy :

- Leighton recalled having a conversation with Lewin early on about the top role, which either of them could have easily assumed. Lewin didn't want to be CEO, but said he'd work for Leighton if he wanted the job. Leighton said he didn't want the job, but that he would work for Lewin if he did. This set off a formal search for a CEO that, by the spring of 1999, was well into its third month. A top executive search firm regularly sent candidates to Cambridge, but when it came time to decide on someone to fill the job, Lewin couldn't commit. The reason, Leighton said, was that Lewin had already decided on the man for the job. In fact, he'd made up his mind before Akamai even incorporated, drafting a list of dream CEOs for his dream company. Topping the list was George Conrades.
- At age sixty, Conrades was comfortably settled into a plumb job as a Venture Partner at Polaris. After four decades on the frontlines of two of the most successful computing companies-International Business Machine (IBM) and Bolt, Beranek, and Newman (later BBN Technologies} Conrades had retired from the career-climbing race. Or so he thought.
- **[...]**
- **When Polaris put $4 million into Akamai 's first round of financing, Conrades agreed to sit on the company's board. At the time, he had no idea that Lewin had a plan to lure him into the role of Akamai's CEO. "It was a whole seduction to get George," recalled Leighton. "Of course we knew he wouldn't be our CEO on day one, so Danny worked to get him on our board. Then we got him on the board and kept working on getting him as CEO.**" Conrades knew Akamai was actively searching for a CEO, but was unaware of Lewin's subtle efforts to court him. **So when Lewin and Leighton invited him for breakfast at Harvest restaurant in Cambridge in late March 1999, Conrades wasn't expecting them to offer him Akamai's top job. "**We told him point blank, we need you to be CEO -what's it going to take?" remembered Leighton.
- Conrades laid out some terms, and Lewin said they'd get back to him later that day. On the way home from lunch, Leighton noted, instead of celebrating what was sure to be a win for Akamai, Lewin suggested they push back on Conrades's terms. "I'm driving away from the restaurant, and Danny is saying how he wants to negotiate," observed Leighton. "I said, 'Danny, what are you doing? Just say yes!"' Leighton added: "That was Danny, always wanting to negotiate the best possible deal."
- **In the end, there wasn't much negotiating, and, on April 7, 1999, George Conrades became Akamai's first CEO, a fitting position for a man who had long been associated with speed.** "To me, Akamai is like Fed Ex," explained Conrades. "Fed Ex changed the game on the postal service, and we changed the game on the Internet." The media seized on Conrades 's move to Akamai as another example of many seasoned executives taking chances on Internet startups in exchange for equity.
- Reporting on this trend, the May 1999 issue of Forbes singled out Conrades, Richard Frank, the ex-chairman of Walt Disney Television who signed on to head Food.com, and James Cannavino, former CEO of Perot Systems who joined the small network security firm CyberSafe. The article posed this question: "Why are these elder statesmen, with little left to prove, now pulling twelve-hour days to run baby firms barely on their second round of venture funding?" While the story speculated that such moves were motivated largely by money, Conrades said he was genuinely thrilled to assume the role at Akamai.
- "I was still full of energy, and I thought the people were just fantastic," said Conrades.
- **Conrades came on board just in time for Akamai 's second round of financing, led by Baker Communications Fund LP of New York. On May 7, Akamai secured $35 million total from Polaris and Battery Ventures, bringing the company's total venture funding raised to more than $43 million.** Todd Dagres told the media it was more than the company needed, and a sizeable sum even for hot startup, which averaged about $20 million in a first round in the late 1990s. Yet Akamai was less than six months old, and its market value had already multiplied tenfold. The day the second round closed, Conrades issued a statement saying Akamai had sufficient capital and had no immediate plans for an additional round of equity or any private or public offering.
- First, Conrades said he needed to step back and give order to what was the chaos of a startup company moving too fast to position itself clearly. "My job was not to understand the algorithms and technology but to build the framework of a business," Conrades observed. "We had to hire and establish a culture; it had to be codified for everyone." One of the first questions he posed to the small company was this: Akamai exists to do what? It seemed so simple, but, as Conrades still recalls, "there was a lot of uncertainty." With the help of everyone at Akamai, Conrades conceived of the company's list of guiding principles, which still stands true today. One of them, which he and Lewin agreed on, was never to dismiss an idea from any source without first giving it consideration. "There was a highly argumentative culture in place, which was either inspired by Danny's Israeli traits or the atmosphere at MIT," said Conrades. "That was good-we reveled in arguing assumptions. But when we did we made a point of listening to everyone." At IBM, Conrades concluded: "there was no ability to do this.
- Some ideas, however, were not up for consideration, no matter how vehemently they were argued. Just after Conrades came on board, he asked Randall Kaplan-who was still working out of Los Angeles-to relocate to Boston. Kaplan pushed back. As the only employee based outside Boston, Kaplan argued that he had originally left his lucrative position at SunAmerica to join

Akamai on two conditions: that he could remain on the West Coast, and that he would report to the company's CEO. Conrades offered Kaplan a second option: remain on the West Coast, but report to Earl Galleher, the VP of Sales. Kaplan refused, and decided to resign. His decision didn't go over well, particularly with Lewin. In the months leading up to Kaplan's departure, tensions between the two were beginning to mount. Although he acknowledged Lewin as one of the most brilliant and talented people he has ever met, Kaplan said he disliked him on a personal level for being what he called too "abrasive." Coworkers said Lewin came to dislike Kaplan, partly because he felt like Kaplan's heart wasn't in the company. Kaplan left the company with a very good deal for himself, one the Wall Street Journal referred to as "a boatload" of stock options-ones he could cash. "Even by the outrageous standards of Silicon Valley, Randall Kaplan is one lucky guy," noted the newspaper. "Unlike his ex-colleagues at Akamai-who have to wait around for four years-Mr. Kaplan already owns all of his shares." By the end of 1999, Kaplan's 2.4 million shares were worth approximately $633 million.

Pages 228 - 230 in OCR copy : (Epligue)

- When they look back on those days, everyone at Akamai agrees they were some of the darkest of their lives. The loss was too searing, the irony too thick. The remainder of 2001, to most of them, was a blur.
- They came to work and continued to carry out the company's new strategy. But they did it all weighted down by heartache. One of Lewin's coworkers said it was like running in snow-they kept moving, but every step felt labored. When they tried to look forward, they did so through the thick haze of grief. They saw nothing but the abyss left by Danny's absence.
- But months passed, and with time, emotional strength regenerated enough for everyone at Akamai to realize that they had one last fight left in them, one that had to be waged in Lewin's honor. They knew it was going to be a fierce one. Although Akamai made it through the days and weeks immediately following the attacks, the company's financial problems were mounting. The attacks sent the U.S. economy further into the black, eating into Akamai's revenues and spawning widespread fears of a recession. Investors lost confidence in Akamai, fearing that Lewin's death meant death for the company.
- Conrades recalled making rounds at the office to check in with staffers who "looked at me like deer in the headlights." As Conrades explained, "This was not the exuberant Akamai they were used to."
- Conrades became well versed at pep talks. "I'd say our stock is coming down, but we're still about one big idea," he recalled, also saying, "The technology still works. The business model works. Then I'd ask them: Do you still have bragging rights at the bar? The answer was yes, so I told them to have faith." He also told them, repeatedly, to do it for Danny.
- Conrades made a pledge to Akamai 's board that he would not step down until the company achieved sustained profitability. But in the two
- years following 9/11, Akamai was written off as another casualty of the dot-com boom. "Everybody had left us for dead," Leighton said. "We were gonna go broke. It was really that bad." The fall was precipitous. Once the stuff of legend, Akamai 's stock was delisted by the NASDAQ after it fell below $1. The company's customers were going out of business faster than the sales representatives could close accounts. More downsizing was necessary, including most of the sales force. Conrades, Sagan and Leighton began citing a metric they called "quarters to live," guessing how many more quarters Akamai could stay in business. {88} But they kept pushing. Every time they thought about Lewin, they became resolute in their pledge never to give up. "The people were really good people, the technology was good, and you know, we were relentless," said Leighton. "It was all about Danny. He had instilled such a culture through the powerfulness of his personality and the people that he vetted and selected that everyone wanted to double down and work extra hard to make Akamai successful. We wanted to make it happen for him, and it was very, very hard."
- Fortunately, Lewin had left behind what Akamai called one "gift" for the company: EdgeSuite. Akamai positioned EdgeSuite as the ticket to its comeback, one that would take the company beyond content delivery to content assembly, presentation, and delivery. Akamai, Conrades said, used EdgeSuite to form a new strategy akin to what Federal Express accomplished when it moved beyond the shipment of packages into the additional services of packing and preparing them for shipment. With EdgeSuite as the centerpiece of a new business plan, Akamai offered customers technology that would accelerate the movement of dynamic content-things like stock quotes, airline prices, auction listings, and weather reports. Prior to EdgeSuite, A.kamai was delivering static pages, which were assembled before delivery, meaning everyone who clicked on them saw the same thing. Dynamic Web sites, in contrast, are put together on the spot and change frequently, often with every click-and EdgeSuite could do this very, very well.

2018 (March 27) - Boston Business Journal - "Former Akamai CEO George Conrades to retire as board chairman"

By Kelly J. O'Brien – Technology Reporter, Boston Business Journal

Mar 27, 2018, 11:31am EDT

https://www.bizjournals.com/boston/news/2018/03/27/former-akamai-ceo-george-conrades-to-retire-as.html

2018-03-27-bizjournals-com-former-akamai-ceo-george-conrades-to-retire-as-board-chairman.pdf

Akamai Technologies Inc. (Nasdaq: AKAM) chairman George Conrades will retire from the company's board as of June 1, the latest change at the Cambridge tech giant since activist hedge fund Elliott Management took a stake in the company last year.

Conrades will retire from the board on June 1, but will hand over the chairman role to another director, Frederic V. Salerno, effective immediately.

"I want to express my deep appreciation to George for his unwavering dedication and tremendous leadership over the past two decades," Akamai co-founder and CEO Tom Leightonsaid in a statement. "The impact of his work cannot be overstated, not just for the growth and customer-focused culture that he fostered at Akamai, but on the evolution of the internet as a whole."

Conrades joined Akamai's board in 1998, when it was still a tiny MIT startup. He took over the CEO role in 1999 and soon led the company through its initial public offering. Conrades handed over the CEO role to Paul Sagan in 2005.

Conrades' departure comes less than a month after the public got its first insight into the strategy that Elliott has in mind for Akamai. In early March, Akamai announced that it would add Tom Killalea, formerly the chief information security officer of Amazon, to its board of directors. The company also said it plans to add another board director, to be named later. Akamai didn't say whether the vacancy left by Conrades' departure would be filled by a third new director.

Akamai also said earlier this month it would work with Elliott to increase operating margins over the next several years.

The company has gone through several tumultuous years thanks to big shifts in the market for its internet content delivery technology. Akamai announced about 400 layoffs earlier this year, some of them connected to failed experiments within the internet content delivery division. At the same time, Akamai is doubling down on its fast-growing cybersecurity division.

Contel Corporation

- 1990/1991 - Purchased by **GTE Corporation**

Founded by : **Charles Wohlstetter (born 1910)**

1990 (July 13)- NYTimes - "Contel Agrees to Takeover Offer by GTE"

By Barnaby J. Feder

Source - [HN01D4][GDrive]

In a move that would sharply expand both its local telephone operations and its fast-growing cellular telephone business, the [**GTE Corporation**] said yesterday that it had reached a preliminary agreement with the Contel Corporation to acquire the Atlanta-based company in a stock swap. The deal would be worth about $6 billion, based on yesterday's closing stock prices.

If the deal is completed and approved by regulatory authorities, GTE, based in Stamford, Conn., would become the fifth-largest local telephone company in the nation, based on number of telephone lines - after the Bell Atlantic Corporation, the BellSouth Corporation, Ameritech and the Nynex Corporation - and its second-largest mobile phone operator, after McCaw Cellular Communications.

"Aside from the obvious synergy of our telephone and cellular operations, both companies have other areas of interest that are remarkably parallel," James L. Johnson, GTE's chairman and chief executive, said in a statement. He cited businesses that supply communications systems to governments, satellite communications operations and aggressive programs by both companies to gain a foothold in cable television services.

"It's a great strategic move and very gutsy," said Jack Grubman, who follows the telecommunications industry for Paine Webber. "The bigger you are in this industry, the better off you are. They got the best of the independent companies at a price that will look good in three or four years."

Investors took a shorter-term view, however. GTE's stock price fell $1.25 a share, to $29.75, in trading yesterday on the New York Stock Exchange. The more than 200 million shares GTE will issue to complete the transaction at an exchange rate of 1.27 GTE shares for each Contel share could dilute GTE's share earnings this year by about 10 percent, analysts said.

Contel shares rose $7.125 to finish at $35.125 a share on the New York Stock Exchange. Charles Wohlsetter, the entrepreneurial 80-year-old chairman of Contel, said that because of GTE's higher stock dividend, Contel shareholders will receive the equivalent of $1.85 a share in dividends for their stock after the deal, a sharp increase from Contel's $1.10-a-share payout.

The proposed deal is one of the largest to date in the telecommunications industry, which has been undergoing a period of consolidation. The MCI Communications Corporation recently bought Telecom USA Inc. for $1.25 billion. In April, GTE agreed to acquire the cellular phone operations of the Providence Journal Company for $710 million, and United Telecommunications Inc. said it would pay $500 million to complete its buyout of GTE's interest in the U S Sprint Communications Company. U S Sprint is the nation's third-largest long-distance enterprise, after the American Telephone and Telegraph Company and MCI.

Earlier this year, McCaw secured its place as the nation's largest cellular concern, based on number of potential customers in its service areas, by paying $3.4 billion for control of the Lin Broadcasting Corporation.

Mr. Wohlsetter and John L. Segall, Contel's vice chairman, will become vice chairmen of GTE and members of its board if the deal is completed. Mr. Wohlsetter would also become chairman of GTE's strategic issues, planning and technology committee. However, the actual roles of both men and of Donald M. Weber, Contel's president and chief executive, at GTE remain to be worked out, said Harvey W. Greisman, a GTE spokesman.

$3.1 Billion is Sales

Contel's attractions for GTE include 2.6 million telephone lines in 30 states, with a far-higher-than-average percentage of its exchanges employing modern digital switches. And Contel has completed a reorganization in which it shed a number of money-losing businesses accumulated during an ill-fated period of diversification. It netted $277 million on revenues of $3.1 billion last year.

Contel Cellular Inc., which is 90 percent owned by the Contel Corporation and 10 percent publicly owned, has franchises in 36 metropolitan areas. The franchises include valuable regions in the Southeast acquired last fall from McCaw for $1.3 billion, making Contel Cellular the seventh-largest cellular business in the nation.

GTE has undergone a wave of restructuring since Mr. Johnson became chief executive in 1988. In addition to phasing out GTE's ownership interest in U S Sprint, Mr. Johnson has shifted headquarters for the local telephone operations to Dallas, begun a drive to reduce employment by 14,000 and reduced GTE's involvement in the development and manufacturing of telephone switches by setting up a joint venture with A.T. &T.

GTE employs 158,000 people and has businesses in 46 states and 41 countries, including local phone companies in Canada and the Dominican Republic that serve 2.3 million customers. In addition to telecommunications, it has a large lighting business. It had net earnings of $1.4 billion on sales of $17.42 billion last year.

Sept. 30, 1986 (Sep 30) - NYTimes - "COMPANY NEWS; COMSAT, CONTEL PLAN TO MERGE"

By David E. Sanger - Source : [HN01H2][GDrive]

Comsat, struggling to recover the growth rates it grew accustomed to in the early days of communications satellites, said yesterday that it would merge with the Contel Corporation in an exchange of stock worth about $2.4 billion.

Under the agreement, Comsat, formally the Communications Satellite Corporation, will retain its name and pursue its unique role as the Federal Government's chief vehicle for operating communications satellites in cooperation with foreign nations.

But control of the company will go to top executives at Contel, which is attempting to speed its entry into the unregulated portions of the telecommunications business - including internal communications for the nation's largest companies and sales of advanced telecommunications equipment to the Federal Government. Contel's primary business is the operation of local telephone companies in 30 states.

Mutual Benefit

The merger will give the Atlanta-based Contel, whose $2.5 billion in revenues last year made it five times Comsat's size, access to Comsat's highly regarded technologies. Contel would also benefit from its role as the international satellite carrier for everything from telephone companies to television networks.

Meanwhile, the Washington-based Comsat will gain the financial resources and marketing power that it has failed to muster in recent efforts to diversify into a range of other communications ventures.

"We realized that we simply did not have a market position in the competitive side of our business," said Irving Goldstein, Comsat's chief executive, who will become vice chairman of the combined venture. "I think now we will have the staying power, the marketing clout and the technical capability that neither company alone had enough of."

Terms of Agreement

Under the terms of the agreement holders of Contel's 76 million outstanding shares will each receive 94-hundredths of a share of Comsat common stock for each of their Contel shares. Comsat closed Monday at $34.25, meaning that Contel shareholders will receive the equivalent of about $32.195. Comsat also said its annual dividend would rise to $2 from $1.20.

Analysts noted that the merger -which was approved by the boards of both companies last Friday, but still requires a go-ahead from the Federal Communications Commission -marked an acknowledgement that Comsat was facing increasing competition in the business where it once held a monopoly: establishing satellite communications between the United States and virtually every other country in the world.

That was Comsat's charge when it was created in 1962 by the United State Communications Satellite Act. At the dawn of the space age, Comsat's chief task was setting up Intelsat, an international consortium responsible for the construction, launching and operation of communications satellites for more than 100 countries. Later, it started Inmarsat, which established the first satellite links to ships and oil platforms at sea. A Hot Stock in 1964

When it went public in 1964, Comsat was considered the hottest of high-tech stocks, with investors receiving only about three shares for every 100 they ordered. Even at the time, many thought the company was racing a bit ahead of the technology. Philip L. Graham, the late publisher of The Washington Post and an early member of the Comsat board, said creating the company was "a little like trying to create an international airline six months after Kitty Hawk."

The company's first satellite, Early Bird, increased the number of international circuits by 50 percent and permitted the first live television transmissions from abroad. And through the early 1970's, the company grew by leaps and bounds - until it became clear that demand for telecommunications was not growing as fast as capacity. Ill-Fated Diversifications

That realization, along with the entry of RCA and other competitors into the international satellite business, led Comsat into a host of telecommunications ventures. Most notable among them were the ill-fated Satellite Business Systems, a partnership with the International Business Machines Corporation and Aetna Insurance to provide communications services to large corporations, and a pay-TV spinoff that was intended to beam television programming from satellites directly into homes.

Both ventures ran up tens of millions of dollars in losses, and were dumped in a restructuring led by Mr. Goldstein and Marcel P. Joseph, Comsat's president and chief operating officer, a longtime veteran of General Electric who is regarded as a tough-minded engineer. Both also worked extensively with Contel, formerly Continental Telecom Inc., when the two companies built a communications system recently for Halliburton Company.

"That led us to discussions of more and more joint ventures," said Mr. Goldstein. "Then in the past month the idea emerged - I can't really remember by who - that a merger would really be the best solution."

The structure of the deal was influenced by Comsat's Congressional charter. "No matter what, Comsat had to be the surviving entity," said Susan O'Connell, special assistant to the chief of the F.C.C.'s Common Carrier Bureau.

At Contel yesterday, executives welcomed the merger. "Having international scope is important to our future, and the Comsat name will help us toward that end," said John N. Lemasters, Contel's 52-year-old chief executive, who will take control of Comsat's executive suite along with Contel chairman Charles Wohlstetter. Contel's American Satellite subsidiary, he said, "has the network we need, and Comsat has the customer base."

2020-12-prabook-com-web-james-quell-crowe-837687

James Quell Crowe - James Quell Crowe, American communications executive. Member National Academy of Engineering, **American Nuclear Society**.

construction company executive

Background

Crowe, James Quell was born on July 2, 1949 in Camp Pendleton, California, United States. Son of Henry Pierson and Mona (Quell) Crowe.

Education

- Bachelor of Science in Mechanics Engineering, Rensselaer Polytechnic Institute, 1972. Master of Business Administration, Pepperdine University, 1982.
- Project engineer Cozzolino Construction Company, Portuguese of Albany, New York, 1971-1973.
- Self-employed, Albany, 1973-1974. Engineer Morrison-Knudsen Company, Inc Company, Incorporated, Saratoga, New York, 1974-1975, project engineer, Washington, 1975-1976, project manager various cities,1976-1980, vice president operations, Boise, Idaho, 1980-1983, group vice president-power, 1983-1986.
- President Kiewit Industrial Company, Omaha, 1986. Chairman Metropolitan Fiber Systems, Chicago, 1988.
- President Kiewit Energy Company, Omaha, 1988.
- Director California EnergyCo., San Francisco.

Career

Project engineer Cozzolino Construction Company, Port of Albany, New York, 1971-1973. Independent, consultant engineer Albany, 1973-1974. Engineer Morrison-Knudsen Company, Inc, Saratoga, New York, 1974-1975, project engineer Washington, 1975-1976, project manager various cities, 1976-1980, vice president operations Boise, 1980-1983, group vice president power, 1983-1986.

President Kiewit Industrial Company, Omaha, 1986—1991. President, Chief Executive Officer MFS Communications, 1993—1997, Level 3 Communications, Broomfield, Colorado, 1997—2000, Chief Executive Officer, since 2000. Chairman, Chief Executive Officer MFS Communications Company, Inc., Omaha, 1988-1997.

Chairman WorldCom, Inc., 1997. Board director Level 3 Communications, Inc., since 1993. Director RCN Corporation, Commonwealth Telephone.

Achievements

- James Quell Crowe has been listed as a noteworthy communications executive by Marquis Who's Who.

Membership

Member National Academy of Engineering, American Nuclear Society.

Connections

Married Pamela L. Powell, June 20, 1986. Children: Sterling, Angela, James Michael.

- **Father:** Henry Pierson Crowe (https://en.wikipedia.org/wiki/Henry_Pierson_Crowe)
- **Mother:** Mona (Quell) Crowe
- **Spouse:** Pamela L. Powell
- **child:** James Michael Crowe
- **child:** Sterling Crowe
- **child:** Angela Crowe

2010 (Oct 04) - Business Wire : "President Obama Names Level 3 CEO James Crowe as Chairman of National Security Telecommunications Advisory Committee"

See [HW005D][GDrive] / October 04, 2010 07:46 PM Eastern Daylight Time

[**Level 3 Communications, Incorporated**]. today welcomed President Obama's announcement of his intent to appoint **James Q. Crowe**, the company's chief executive officer, to the position of Chair of the National Security Telecommunications Advisory Committee (NSTAC).

"The public/private partnership of the NSTAC has resulted in unique contributions to critical infrastructure protection, information sharing, network convergence, security and communications infrastructure reliability across the nation."

As chairman, Crowe will preside over a 30-member committee that comprises industry executives from major network service providers, IT, finance and aerospace companies. The NSTAC provides critical industry-based analyses and advice to the President on policy and technical issues regarding national security and emergency preparedness communications. The committee also develops recommendations to the President to assure vital telecommunications links through any event or crisis.

"I am honored by the opportunity to chair this important committee," said Crowe. "The public/private partnership of the NSTAC has resulted in unique contributions to critical infrastructure protection, information sharing, network convergence, security and communications infrastructure reliability across the nation." [...]

2013 (May 09) - Omaha World Herald - "Crowe, who built Level 3 Communications from ground floor, to retire"

By Barbara Soderlin WORLD-HERALD STAFF WRITER / Source : [HN01CR][GDrive]

James Q. Crowe, who led the development of Level 3 Communications from its Omaha origins, announced Thursday he plans to retire by the end of 2013 from his position as the Broomfield, Colo., firm's chief executive officer.

The board of directors, led by chairman Walter Scott Jr., has formed a committee to select a new CEO. Crowe will remain on the board.

Crowe led MFS Communications Co. in Omaha when it was a subsidiary of Peter Kiewit Sons' Inc. under Scott and after it was spun off in 1995. It was sold in 1996, and Crowe returned to Kiewit to head the Diversified Group, which was founded in 1985 to hold Kiewit's nonconstruction assets.

A year later, he announced that Diversified Group would move its headquarters out of Omaha and start an Internet-related telecommunications business in a city where it would have an easier time attracting high-tech workers. It was discouraging news to the Omaha business community at a time when the Peter Kiewit Institute was in its infancy.

In 1998, Kiewit Diversified Group changed its name to Level 3 Communications Inc. and started trading on the NASDAQ exchange, drawing heavy investment from the Omaha area.

Today the firm provides data, Internet, voice, video, security, IT and managed services. It has service in more than 70 countries and more than 100,000 "route miles" of fiber optic cable.

"Level 3," Crowe said, "is extraordinarily well-positioned to benefit from the worldwide explosion of voice, data and video carried over the Internet."

In February, it reported year-end revenue of $6.38 billion, up from $6.32 billion in 2011. Level 3 in 2012 had a net loss of $422 million, compared with losses of $875 million the year before.

Scott thanked Crowe for his leadership and for all that he has done to build Level 3. "It is no exaggeration to say that, without Jim, there would be no Level 3."

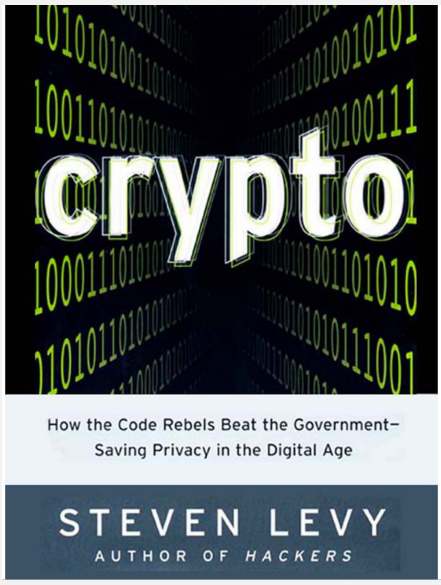
The Crypto War in the USA Intelligence Community

"Crypto, How the Code Rebels Beat the Government--Saving Privacy in the Digital Age"

Chapter - Slouching towards crypto

2001-crypto-rebels-beat-the-government-saving-privacy-steven-levy https://drive.google.com/open?id=10FVeVDaCy2o-8T9ZutXBpI_sTKx54iUy



2001-crypto-rebels-beat-the-government-saving-privacy-steven-levy-cvr.jpg / https://drive.google.com/open?id=10Iaq4dtjD2SMyV25wVuv1nOd5O3TyIpi

by 1995, it was clear that the field of cryptography—as well as its reach—had dramatically changed, despite the government's best efforts. Crypto, propelled by computer power and new discoveries by the Whit Diffies of the world, was moving at a turbocharged pace, shifting from Pony Express to Internet time. But the basic principles remained. Despite the increasingly invoked specter of crypto anarchy— where codes would proliferate unchecked, to the point where no government or institution could even hope to get a handle on digital commerce or law—the ancient clash of measure and countermeasure persisted. Only now the outsiders had a hand in the game.

Over a century before, Edgar Allan Poe, who had been nearly obsessive on the subject of cryptology, wrote, "It may roundly be asserted . . . that human ingenuity cannot concoct a cipher which human ingenuity cannot resolve." Mathematically, of course, Poe was wrong; the verifiably impenetrable onetime pad was a firm "nevermore" to his claim. But implementing a one-time pad was demanding; certainly it was inappropriate in large-scale settings. So on a practical basis, was the poet's claim correct? When Martin Gardner had cited Poe's quote in his famous Scientific American article about RSA, he had thought not.

The question certainly bugged Phil Zimmermann. In his heart, he felt that the encryption algorithm at the center of his PGP software was sound. In naming his program, he felt that "pretty good" was an understatement: users should be able to count on its imperviousness to codebreakers. The government, at least publicly, hinted that PGP was strong, too. In the spring of 1995, Louis Freeh of the FBI and William Crowell of the National Security Agency had testified in a classified congressional briefing about the difficulty of breaking crypto with long key sizes. Freeh complained, "We don't have the technology or the brute-force capability to get to this information." Crowell went even further. Citing current personal computer technology, he said that to crack "128-bit cryptography, which is what PGP is . . . would [take] 8.6 trillion times the age of the universe."

But Zimmermann knew that a brute-force attack on IDEA (International Data Encryption Algorithm) was not the only way to gut his cipher into something that could be called "Pretty Good Try at Privacy."

There were countless ways to crack a code. Maybe through stronger factoring algorithms and dedicated hardware a supercomputer could make much faster work of the public key part of the program. Or, even more likely, there could be quirks in the details of PGP's implementation that would provide a

cryptanalyst with a precious shortcut to plaintext.

As it happened, one evening at the 1995 crypto conference at Santa Barbara, there was a cocktail party alfresco, and late in the evening a few cryptographers, decked in traditional garb of T-shirts and sandals, gathered around one of the event's keynote speakers. He was Robert Morris, Sr., and until recently the only crowds he'd addressed were those authorized to receive U.S. government secrets. He had just retired as a top scientist at Fort George Meade. Morris's reputation—enhanced by the unknowable feats he may have accomplished in the service of spookdom—drew a small crowd to his table. And when Morris mentioned that he wouldn't mind meeting Phil Zimmermann, the neatly bearded forty-one-year-old was quickly called over.

"Phil, let me ask you a question," said the former intelligence man, puffing aggressively on a cigarette.

"Say that someone used PGP for very bad stuff. How much would it cost us to break it?"

Zimmermann seemed flustered. "Well, I've been asked that before," he said. "It could be done."

"But how much would it cost us?"

It was far from Zimmermann's favorite subject, but he played along. He conjectured that the best attacks on PGP would not be on its key size but on other weaknesses. Its data structure could be troublesome, he admitted, its error correction poor.

Morris nodded and said nothing. He'd been playing with Zimmermann. Who the hell knew if the NSA had already unearthed some elementary flaw that enabled the acres of silicon in its vaunted basement instantly to cough up the plaintext of the freedom fighters who allegedly used Zimmermann's program?

But the next day in his talk, Morris implicitly provided a commentary on the new cryptographers and their crypto-anarchist visions. He revealed no trade secrets. But somewhat in the spirit of the Eastern masters, Morris did present a pair of truisms—koans of the crypto faith—that pointed toward an eventual rapprochement between the Equities, one beyond the current political struggles. A glimpse of a post- Clipper society in the century to come.

Koan One (for codemakers): never underestimate the time and expense your opponent will take to break your code. The inner text of the Morris speech was that cryptography is best left to those of a paranoid mind-set, those who believe beyond question that their opponents just may be very rich, very clever, and very dedicated—hellhounds on the trail. They will launch powerful frontal assaults on your codes. And, often, they will win.

Koan Two (for codebreakers): look for plaintext. This was reassurance to the crowd that no matter how baffling the task of codebreaking might seem, the fact is that very fallible human beings are the ones who must employ these sophisticated systems. So sometimes, when one least expects it, a seemingly impenetrable code—the jumble of ASCII confetti one must hammer into human language—might have a passage, or an entire message, somehow unencoded. In that case, you could read it as easily as a fortune cookie.

To the crypto anarchists, Morris was saying, "Hey, it's not that easy to create a cipher utopia." The ancient game would go on. But by imparting the lesson to outsiders he was also tacitly acknowledging that the future belonged not just to the NSA illuminati, but to these T-shirted longhairs at Santa Barbara as well.

Morris's statements came at a time when the tension between public and government crypto was at its height. Further, a novel twist had recently been introduced. Some of the emerging crypto forces were now well beyond code making and deeply into cryptanalysis. While this had been undertaken by the crypto crowd before—most famously in the attacks on Merkle's knapsack scheme—there was now a new sort of effort. It did not conform to the traditional rules forged in the world of William Friedman or Alan Turing. . . . It was an aggregate code breaking, a mass effort powered by the amplifying abilities of the Net. Its practitioners were, of course, cypherpunks. This breed of codebreaker was not interested in crime and espionage, but in making a political point and reaping big fun in the process.

One of the first efforts began with Phil Zimmermann's PGP software. Long before Morris brought up the question of PGP's strength at Crypto '95, its users had been plagued by nagging questions of its resilience. Their angst reflected the key dilemma of guerrilla cryptography: could you trust software developed without the imprimatur of an organization known for secure codes? This was the question that Derek Atkins, then a twenty-year-old electrical engineering student at MIT, was asking himself in 1992.

His initial reaction to Zimmermann's program was to join the crusade, and he became part of the impromptu development team creating new versions of the software. But then Atkins came to wonder what attacks might work against it.

As Bob Morris indicated in his talk, there are two general ways to crack a cryptosystem. The first way is brute force—to try all possible solutions until you hit on the right one. The second method involves seeking a shortcut, an unintended weakness, which may enable you to break the codes. As Atkins spoke to his friends—including Michael Graff at Iowa State University and Paul Leyland of Oxford University—he decided on the former style of attack. Trying to find a subtle flaw was a task beyond his abilities and experience. (Though, as Morris implied, it was a route that the NSA had probably attempted.) On the other hand, everybody seemed to agree that a direct, and perhaps feasible, route to cracking PGP would be one that worked against any RSA-based program: factoring.

Rivest, Shamir, and Adleman had understood, of course, that if someone figured out a quick way to factor—to determine two original primes from the key based on the product of those numbers—their system was dead meat. But even though they had expected somewhat better factoring algorithms to come, they figured that nothing on the horizon would make it feasible to break RSA. Atkins and his friends, however, wanted to test that proposition. They suspected that by relying on a previously unavailable resource—the thousands of computers accessible to people on the Internet—they might be able to make factoring history. This was a fascinating premise, regarding the aggregate computing power of Internet users as sort of a giant supercomputer, perhaps a kludged cousin to the ones that supposedly existed in the basement of Fort Meade. They ran the idea past Arjen Lenstra, the renowned mathematical expert at Bellcore in New Jersey. He told them that the large prime numbers commonly used in PGP (as well as the commercial versions of RSA) would be too formidable to attack. Then he suggested another challenge: RSA 129.

Lenstra's idea cut to the heart of the issue of whether or not cryptography could ever assure perfect security. The RSA 129 challenge was the one offered in Martin Gardner's Scientific American column in 1977—the column that began by declaring moot Poe's dictum that no code was impervious to cracking.

The challenge still had not been met in all these years. The estimate of time it would take a dedicated supercomputer to factor a number that size was forty quadrillion years. But even if you did not accept that number (Rivest now says it was a miscalculation) even a much, much smaller number—a billion years, say, or a measly few million—would indicate that anyone breathing today's air would have been long rendered into a dust ball before the secret of the RSA message encoded with a 129-digit key would be revealed.

Yet fifteen years later, Atkins, Graff, Leyland, and Lenstra joined forces with the Internet to attempt to collect that hundred dollars—in a matter of months.

The first, and probably most important, thing they needed was a good factoring algorithm. There had been some conceptual advances in this area since Gardner's column had been published. Specifically, someone had devised the "double large prime multiple polynomial variation of the quadratic sieve." This involves searching in a numbers realm called vector space for numbers known as univectors. These can be combined to chart mathematical relations in a way that yields the two original primes. "You don't have to search the full space of possibilities, but only a small finite portion of the space," says Atkins. "One way of looking at it is that we were looking for eight million needles in a haystack full of countless needles. You're not looking for any particular needle—you just find enough of them and combine them in a special mathematical means to actually factor the number." That technique was perfect for a distributed Internet attack, where literally hundreds of people would join forces to solve the problem. During the summer of 1993, the software was ready—Atkins had been running some of it on the MIT Media Lab computers—and they could now recruit volunteers with computers. The response was terrific: over 1600 machines worked on the problem, all over the world, every continent except Antarctica. The computers ranged from garden variety PCs to the 16,000-processor Maspar supercomputer at Bell Labs.

A standard measurement of computer power is a MIPS year—one year of constant use of a Million Instructions per Second machine. From September 1993 to April 1994, the RSA 129 experiment used about five thousand of those MIPS years. It was then that Atkins and the others guessed that they finally had enough univectors to do the final calculations. As planned, they sent it to Lenstra at Bell Labs, who would then do the final "matrix reduction." Atkins sent Lenstra a tape with 400 megabytes worth of univectors, via U.S. mail. He also sent a backup by FedEx. Lenstra fed it to his machines, and for two days they matrix-reduced. On April 24, 1994, Atkins posted the following message on the Net: We are happy to announce that

RSA-129 =

114381625757888867669235779976146612010218296721242362562561842 9 \3
570693524573389783059712356395870505898907514759929002687954354 1 =

349052951084765094914784961990389813341776463849338784399082057 7*3
276913299326670954996198819083446141317764296799294253979828853 3

Applying that key to the number that represented the enciphered message text, they were able to transform it into a similarly long number. This was easily converted to English by one of the oldest decoding schemes in history: 01 = A, 02 = B, and so on. That yielded the secret that supposedly would last for a quadrillion years:

THE MAGIC WORDS ARE SQUEAMISH OSSIFRAGE

Did this discovery rock Ron Rivest's world? Not really. In the years since Gardner's article, he had kept track of developments in factoring, and had concluded it wasn't impossible that one day he might have to write out a check for $100 to someone. (Amazingly, he had forgotten the actual message.) He even defends Gardner's prediction that a break in our lifetime was extremely remote. "It was probably accurate for the analysis of the fastest algorithm we knew about at the time, but technology was moving fast on the factoring frontier."

But the very idea of a "factoring frontier" was enough to throw some doubt into the security of the most popular public key cryptosystem. After all, if factoring was easy, RSA was, well, worthless. Of course, breaking RSA 129 was nowhere near as challenging as cracking RSA codes set at commercial strength.

When the RSA system uses 129 digits, the key turns out to be 425 bits long. But the standard RSA key— the one used by the company's actual software—was 1024 bits long. Had the Atkins team attempted the same task with that key length, their computers would still be working on the problem—for a few million more years.

Yet that degree of futility had once been predicted for RSA 129. Might new techniques to factor numbers melt down even the fattest RSA keys? There may well be mathematical breakthroughs to speed up factoring, but an even greater threat to the strength of the cryptosystems was the development of what are called quantum computers, machines that take advantage of subatomic physics to run much faster than our current models. (Think of the speed differential between turtles and laser beams.) While these machines still existed only in theory, scientists had been taking the first difficult steps toward implementation. Once the journey toward quantum computers was completed, you could stick a fork into the RSA cryptosystem. "I think that I shall see a special-purpose quantum factorization device in my lifetime," cryptographer Giles Brassard wrote in 1996. "If this happens, RSA will have to be abandoned." This was published, of all places, in CryptoBytes, the technical newsletter of RSA Data Security.

But that remained speculation. The reality is that Derek Atkins and his colleagues took what seemed to be an invincible problem and, working informally, with an ad hoc collection of computers, managed to crack it. "What we learned is that a bunch of amateurs can get together and do this," he says. And that all claims of invincibility should be regarded with skepticism.

The next target was an irresistible one: the 40-bit crypto allowed by the government for export. The point this time would be purely political. If the barn-raising style of cryptanalysis used in the RSA crack was directed against the puny key lengths negotiated by the Software Publishers Association in 1992 (and, despite government promises, not adjusted in subsequent years), those keys would surely fall, and the need for stronger crypto would be obvious.

After one cypherpunk suggested a "Key Cracking Ring," Tim May urged action, guessing that the "CPU horsepower of this list could be quite impressively applied" to crack the key in six months, making a strong statement against U.S. export standards. (Six months was a guess. But comparing the computation effort to the RSA's crack was somewhat like apples and oranges—keyspace search versus factoring.)

"Heh, I was already working on it . . . ," wrote Adam Back, a twenty-five-year-old computer science student at Exeter College in England. Immediately after seeing the first posting, he'd begun writing scripts to allow people to participate in a group crack. He knew what he was doing, since he had been recently playing around with Rivest's RC-4 algorithm—the actual cipher that performed the 40-bit encryption permitted for export by the government in programs by Microsoft and Lotus.

A brute-force attack on a bulk encryption cipher like RC-4 or DES requires the codebreaker to try out every possible key combination. Finding a key requires searching through the entire space of possibilities; in the case of a 40-bit key there are about a trillion actual possibilities, enough to keep a pack of computers busy for days. That's what Adam Back had in mind: a mass effort with each attacker claiming some portion of keyspace, testing it, and then requesting another. The process would continue until someone found the key. Back posted his scripts to his Web page, and a group of conspirators from various corners of the world quickly gathered. Eventually, eighty-nine cypherpunks participated in trying to find a 40-bit key in Microsoft's database program Access.

But the Microsoft Access crack was doomed. After the entire keyspace was "swept," none of the millions of potential keys unlocked the message. It turned

out that the would-be crackers were stuck on a technical point that kept them from actually getting the plaintext. (“The problem was a lack of specifications,” says Back. “We didn’t know what format the file was in.”)

Still, the cypherpunks emerged from the failed Microsoft attack with some group-cracking software, a loose yet dedicated organization, and a continuing desire to expose what they believed was the pitiful sham of export-level crypto. And then the cypherpunks hit upon an even better target for a brute-force attack: Netscape.

In 1993, two students at the University of Illinois had engaged in a coffeehouse conversation that would not only change the course of the twenty-two-year-old international network called the Internet but would profoundly affect the adoption of crypto. One of them, a chunky undergrad named Marc Andreessen, had recently been learning about a new system on the Internet brashly named the World Wide Web by its inventor, Tim Berners-Lee, a British computer scientist working in Switzerland. The Web was an ingenious way to publish and get access to information on the Net, but only a few in the technical community had adopted the system. Andreessen saw a wider potential. If someone created a slick “browser” to surf through the information space created by a multitude of people who shared text, pictures, and sounds on the Web, he said to his colleague Eric Bina, the Internet itself would be easier to use and a better way to get information. The pair, both of whom worked at the Supercomputing Center at the university, created Mosaic, the first great Web browser. Instead of being forced to use arcane commands and tackle a baffling alphabet soup of acronyms, people could now get all sorts of wonderful stuff from handmade Web “pages”—at the click of a mouse! It was an instant phenomenon; to use Mosaic was to swoon with the excitement of participating in a vast experiment with the future of information sharing. Soon a team at Illinois had churned out versions of the program for virtually every computing platform. Millions of people downloaded them, and thousands of Web sites sprang up to take advantage of the audience.

In 1994, Andreessen had another famous cup of coffee, this time with Silicon Valley entrepreneur Jim Clark. The just-departed CEO of Silicon Graphics was casting about for a big new idea for a start-up company, and with this college kid he hit one of the richest pay dirts in history. Clark, who’d been unaware of the Web boom up till then, quickly realized that there were untapped commercial possibilities for the Web, and grabbed not only Andreessen but most of the Illinois team to start Mosaic Communications. (When the university objected to the name, Clark changed it to Netscape.) The idea was to develop an improved browser called the Navigator, along with software for “servers” that would allow businesses to go on-line. The one missing component was security. If companies were going to sell products and make transactions over the Internet, surely customers would demand protection. It was the perfect job for encryption technology.

Fortunately Clark knew someone in the field—Jim Bidzos. By the time negotiations were completed, Netscape had a license for RSA and the company’s help in developing a security standard for the Web: a public key–based protocol known as Secure Sockets Layer. Netscape would build this into its software, ensuring that its estimated millions of users would automatically get the benefits of crypto as envisioned by Merkle, Diffie, and Hellman, and implemented by Rivest, Shamir, and Adleman. A click of a mouse would send Netscape users into crypto mode: a message would appear informing them that all information entered from that point was secure. Meanwhile, RSA’s encryption and authentication would be running behind the scenes.

Jim Bidzos drove his usual hard bargain with Netscape: in exchange for its algorithms, RSA was given 1 percent of the new company. In mid-1995, Netscape ran the most successful public offering in Wall Street’s history to date, making RSA’s share of the company worth over $20 million. (Not bad, Bidzos realized, for a company that was just about flatlining until Lotus’s $100,000 advance for the Notes license.)

It was just after that eye-opening IPO that a cypherpunk named Hal Finney began looking at Netscape’s security. Finney, a Santa Barbara–based programmer who had participated in PGP development, was particularly interested in how cryptography would be used with electronic commerce, and had become familiar with Netscape’s Secure Sockets Layer. In adhering to the export regulations, Netscape had released two versions of the browser: a domestic version with a 128-bit key for its RC-4 encryption function, and a 40-bit version for export.

Finney set up a challenge to break a message encrypted with that weaker key. He would make a dummy Netscape transaction—just as if he were a customer—then use the encryption in the export version. “I basically connected to Netscape in one of their secure pages and typed in some random data where I was supposed to be ordering a T-shirt or something,” he says. Then he captured the encrypted data and included it in his challenge:

To: cypherpunks@toad.com

Subject: Let’s try breaking an SSL RC4 key

Since this whole Microsoft Access thing turned out to be a dud, maybe an alternative would be to try breaking the 40-bit RC4 used in Netscape’s SSL (Secure Sockets Layer) exportable encryption . . .

From England, Adam Back’s group accepted the challenge. Though Back’s original intent seems to have been to apportion the keyspace among many people, he wound up accepting the offer of an Australian programmer to organize half the search. The rest of the keyspace was to be swept by volunteers who were assigned slices. But there was some confusion between the two groups that slowed down the effort for some days.

It was during this lull in the action that Damien Doligez began to wonder what was taking so long. Doligez was a twenty-seven-year-old computer scientist who had just gotten his Ph.D. a few months before and was working as a researcher at INRIA, the French government computer lab. His office was in one of a cluster of shacks in what was once a NATO base a few miles outside of Versailles. Doligez had a personal interest in crypto. He shared the sense of disgust at the way governments attempt to suppress their citizens’ ability to communicate privately with each other, and he believed that if someone cracked one of those artificially lame 40-bit cryptosystems, it would be a blow against the powers that be. He also guessed that after the successful RSA 129 crack, a two- or three-week effort should do the job. So as time passed between Finney’s challenge and its solution, he wondered what the hell had happened.

As a researcher at INRIA Doligez had access not only to the workstation in his small office, but also to an entire network of computers, including a Maspar supercomputer. Doligez studied the SSL specifications and concocted a small program to allow a computer quickly to test out a potential key, then adapted the program so it would work on the various machines on the INRIA network, as well as on some machines at the nearby universities, L’École Polytechnique and L’École Normale Supérieure.

Then he began his own multiple-computer attack. Whenever an INRIA worker would stray from his or her computer, within five minutes, Doligez’s program would take over the machine, crunching perhaps 10,000 keys a second. Simply by touching the keyboard, a user could regain control over the machine. No one complained.

Doligez figured that his odds of finding the key would be better if he started from the end of the keyspace and worked backward. “I figured the cypherpunks would start from the start, so I started from the end.” He set his network into action on Friday, August 4, and left for the weekend. On Monday, he returned and discovered a bug in his program. He restarted the process. From that point, the number crunching ran perfectly, but he wound up writing ten new versions of the software over the next few days to address glitches in the communications between machines. The program was working fine when Doligez left work on Friday, August 11. Due to a national midsummer holiday that next Tuesday, on August 15, it would be a four-day weekend, but checking on his home computer before the holiday ended, his software gave him the message he was waiting for.

“I saw it found the key,” he says. SSL had been cracked!

The following day, Damien Doligez drove to work from his home outside Paris and recovered the key from his workstation, then successfully decrypted the message. He posted a message to cypherpunks with the heading “SSL challenge—broken!” As proof, he displayed the plaintext. Those familiar with the RSA 129 crack appreciated the significance of the address of the fictional character that Hal Finney had created in his coded message. Mr. Cosmic Kumquat, of SSL Trusters, Inc., lived at 1234 Squeamish Ossifrage Road.

Though technically it was anything but shocking—the mathematics of cryptography dictated that a weak key should fall to a concentrated effort—the very idea of cracking Netscape’s crypto captured the imagination of the popular press. The media descended on Damien Doligez. Because the break occurred only a week after Netscape enjoyed perhaps the most successful IPO in history, some journalists played the crack as if it spoke to the nature of the browser’s overall security, and not as an example of the way the government export rules weaken software in general. In a message that Netscape posted on its site later that week, the company noted that Doligez had simply broken one message—and that it took about 64 MIPS years to do so. Netscape also estimated that the cost of breaking the message had been $10,000. But as Doligez pointed out in his own response, he had used idle computer time, and paid nothing to do so. Netscape was on firmer ground when it noted that the domestic version of Navigator used a much sounder 128-bit key. “The computer power required to decrypt such a message would be more than a thousand trillion trillion times greater than that which was used to decrypt the RC-4-40 message,” wrote Netscape.

Which as far as the cypherpunks were concerned was exactly the point: export-level crypto was needlessly weak.

But the cypherpunks were not through with Netscape. At Berkeley, two first-year graduate students were inspired by group cryptanalysis. They were twenty-two-year-old Ian Goldberg and twenty-twoyear- old Dave Wagner. They, too, thought it would be a good idea to hack Netscape, the new flagship for Internet security. But they had missed out on the obvious brute-force attacks—Goldberg had been moving to California from his native Canada and Wagner had just arrived after getting his undergraduate degree at Princeton. So they began to explore a different mode of attack, more akin to the second of Robert Morris’s recommendations: look for plaintext. Could it be possible that the Netscape security team made some simple yet egregious error in implementing their software, thus exposing what might be millions of electronic commerce transactions to eavesdroppers? Not likely. But, as Morris had suggested, you never know unless you look.

And that’s when Wagner saw it. Buried in the code were the instructions for Netscape’s Random Number Generator (RNG). This is an important part of any sophisticated cryptosystem—the piece of code crucial to scrambling the letters so that the encoded text offers no tell-tale patterns that would help a cryptanalyst. It is well known that a lack of true randomness is a weakness smart codebreakers can eventually exploit. So it is important to have a solid RNG—something that spins the alphabetic roulette wheel thoroughly.

An important part of a good RNG is the use of an unpredictable “seed”—a number that begins the randomization process. Since, unlike dice, computers do the same thing each time they run, it is essential to begin the process with a seed that a potential opponent cannot possibly guess. Methods of doing this often include using some off-the-wall statistics from the real world—the position of the mouse, for instance. Anything that an enemy could not possibly know.

Netscape, as it turns out, had ignored this wisdom. When Dave Wagner looked closely at the code, the error jumped out at him. Netscape derived the seed of its RNG from three elements: the time of day and two forms of user identification called the Process ID and the Parent ID. A disaster. A foe would burn few computer cycles and even fewer brain cells finding the first part of the seed: it is easy to run through the limited number of times of day. And in many cases, both kinds of identification numbers were also easy to find, particularly if someone is sharing a server with a number of people—as often happens in an Internet environment. “If an attacker has an account on your machine, it’s trivial,” says Goldberg. “Here at Berkeley, there are thousands of users. If anyone uses Netscape, you can discover the IDs.” But even without that advantage, it would be fairly trivial for attackers to calculate out those IDs. The identification numbers in question were only fifteen bits long, easily susceptible to brute-force attacks.

Over the course of a weekend, Wagner and Goldberg wrote a program to exploit the weakness. On Sunday night, they tested it. By zeroing in on the huge flaw in Netscape’s implementation, they were able to find a secret key in less than a minute. Hasta la vista, Netscape security. Goldberg posted the result on the cypherpunks’ mailing list that night. “We didn’t expect lots of press,” he said. Silly boy. Among the readers was a New York Times reporter. When the story ran in the Paper of Record, the two grad students were deluged with curiosity seekers and journalists. Of the things that the two grad students had to say, perhaps the most sobering was Goldberg’s observation, “We’re good guys—but we don’t know if this flaw has been discovered by bad guys.”

Unlike the first Netscape crack, where the company could quite rightfully claim that their otherwise strong crypto was crippled by government restrictions, this was a total flub. You didn’t need to tap a multi-workstation network, or get access to a supercomputer. In certain circumstances all you needed was a minute’s worth of crunching on a vanilla Pentium machine. “Our engineers made an implementation mistake,” admitted Mike Homer, Netscape’s vice president of marketing.

The error cast a shadow on the security of the leading Internet software company. “If Netscape did this wrong, what else did they do wrong?” asked cryptographer Bruce Schneier. But the more pressing question was, if Netscape was unsafe, what was safe? Netscape, after all, was making a concerted effort to protect its users. If the Navigator could be cracked so easily, what hope was there for the others?

There was a bright side to the event: you could argue that things worked properly because the cypherpunks publicly exposed a weakness, which Netscape immediately moved to fix. But the lasting lesson was somewhat darker. As the Internet proliferated, the public was beginning to become truly dependent on networked computers for financial transactions and storing private information—everything from buying books to making stock trades to paying bills. New businesses were planning to put medical records on-line. But security was still haphazard at best. And more and more, it was becoming clear that one big reason for this failing was the United States government’s long-term stalling action. While it tried to push Clipper and key escrow as its pet solution to the problem, the Internet kept going—without an organized effort to provide the protections it needed.

During the mid-1990s, though, those trying hardest to bring to fruition a new era of cipher protection—one that would finally secure the Internet and other electronic means of communication—found themselves under increasing fire. It seemed that those in charge of the laws and institutions of society, while not

able to shut down mathematical and engineering progress, could do plenty to make crypto innovators know that their actions had consequences. The question became how far was the government willing to go to invoke those consequences.

For Ray Ozzie of Lotus such a lesson in power would have seemed unnecessary: he was committed to working within the system. (Besides, in 1993, Lotus had officially joined the Establishment when it was bought by IBM for $3 billion.) In the years since his early adoption of RSA, Ozzie had become a vocal figure in the crypto battles, testifying in Congress and visiting key administration figures. Though his procrypto bias was plain, Ozzie's easy manner and willingness to consider the opposing view earned him the respect of even export hard-liners. He was a realist. Unable to wait for the government to liberalize its rules, he was constantly brainstorming for innovative ways around the export impasse.

After the Netscape crack, overseas buyers of Lotus Notes became increasingly uneasy using the 40-bit encryption IBM was permitted to ship overseas. They wanted to know why it was that American customers were sold a version with 64-bit keys, millions of times more difficult to break—while their version could be cracked by some random postdoc outside Paris. (Meanwhile, companies like Microsoft, which didn't want the hassles of making two flavors of the same product, gave all their customers weaker crypto. This made the whole product line less valuable to those who wanted encryption, and some of those customers began buying from foreign companies that could legally sell them strong crypto.)

In 1995, Ozzie came up with what seemed a preferable compromise, at least in the short term: a mathematical fix devised to satisfy the NSA's requirements. Though Ozzie hated Clipper, his scheme was sort of a less onerous version of it. Lotus would still sell two versions of Notes, but unlike prior versions, both would have 64-bit encryption. But the international version would have a little gift for the NSA: something called the National Security Access Field (NSAF). This consisted of 24 bits of the encrypted data that the NSA, and only the NSA, could decode. It was to be encrypted by the NSA's public key, so only the folks at The Fort could exclusively decrypt that field. After the NSA used its private key to unscramble the 24-bit NSAF, the Notes-encrypted messages would have shrunk from 64-bit ciphertext to 40-bit ciphertext. Cracking the remaining code would require precisely the same work factor as messages encrypted with 40-bit keys shipped under the old system. But since the overall encryption was stronger against all attackers other than the NSA—and it was those other attackers most users were worried about, like vandals or industrial spies—Ozzie figured that this solution might help in the short run.

Lotus filed two patents for its innovation, called "Differential Work-factor Cryptography Method and System," in December 1995, and included the innovation in the new version of its software, Notes Release 4. He first spoke about it publicly in January 1996, at the RSA Data Security Conference in San Francisco. The conference was another of Jim Bidzos's marketing brainstorms. Since 1990, the RSA Data Security honcho had been gathering commercial crypto customers in the Bay Area, sponsoring a few days of seminars and a small trade show where vendors could show their wares. From a gathering of a few dozen geeks at the Sofitel Hotel near RSA's Redwood City offices, the conclave had grown to thousands and was now held at a large hotel near Union Square. Ozzie's speech drew a lot of attention, and not a little hand-wringing: some wondered whether the dynamic designer behind Notes had given up the fight.

No, he hadn't. Ozzie was just pursuing a more subtle agenda. "I wanted to stir things up," he said. The idea was to knock a wedge between the administration and the NSA. Once Al Gore had backed down from the idea of government-controlled escrow facilities, the NSA found little to like in those post- Clipper ideas. If people stored keys in private facilities, authorities would need a warrant to get hold of them. But the NSA operated in secret and was banned from domestic surveillance. So the agency might prefer Ozzie's scheme—which gave it a head start in cryptanalysis. (It wouldn't need a warrant to get those 24-bits' worth of decryption.) Thus, Ozzie's scheme was far from a sellout—it was a subversive strategy to get the NSA and the administration arguing for different approaches. In the confusion, he hoped that his industry could sneak through its own solution.

Before Ozzie could congratulate himself on his cleverness, he discovered that the government was not without its own means for dealing with such strategies. On December 30, 1996, both Ozzie and his coinventor Charles Kaufman were sent letters labeled in boldface: SECRECY ORDER. Their patent application, read the letters, "contains subject matter the unauthorized disclosure of which would, in the opinion of the sponsoring defense agency, be detrimental to the national security." (In the space where the government patent officer could check off which agency that was, there was an X next to "ARMY.") Disclosing the subject matter to anyone without authorization, they were warned, would subject the inventors and IBM to a penalty, including a jail term. Finally, they were instructed, any copies of the subject matter "should be destroyed by a method that will prevent disclosure of the contents or reconstruction of the document."

Ozzie, who received the order on January 7, 1997, immediately understood that complying with that order presented something of a problem. Not only had he spoken in detail about the scheme numerous times, but the "subject matter" had also already been distributed to almost six million Lotus Notes users, about half of whom were outside the United States. He quickly informed his bosses at Lotus, who immediately began pondering the consequences of having one of the most popular software programs in the world deemed a government secret.

Perhaps the best thing Ozzie did was to have a friend call the deputy director of the NSA, Bill Crowell, who reportedly laughed when he heard of the news, and told the friend he'd look into it. On January 9, Crowell called Ozzie. It was all a mistake, he said. Everything would be fixed. Indeed, the next day, when IBM attorneys got in touch with the Patent Office, they got a verbal confirmation that the order had been rescinded, and later got a fax to that effect. No longer were Ray Ozzie, his coinventor, and IBM liable for about six million violations of the patent secrecy act. But after everyone had some time to breathe, questions remained. If this was the fate that welcomed someone trying to serve his customers in the spirit of key escrow, what would happen to those who outright challenged the government?

Jim Bidzos could answer that question. As he took the most public stance possible in opposition to the government—he even distributed posters urging people to "Sink Clipper"—the relationship between his company and the NSA had gotten more contentious. Though Bidzos had no hard evidence of having been wiretapped, he assumed that he was under surveillance. Perhaps the most egregious confrontation came in April 1994, during a meeting with three NSA export officers, all of whom Bidzos had been grappling with for years. Two were women he'd come to trust to some degree, but the third was a man who clearly despised Bidzos and his company.

Since the NSA reps didn't open the meeting with any specific issues, Bidzos used the opportunity to lecture them about Clipper: no one would use it, it was a flawed system, yadda yadda. Bidzos noticed the man from the NSA getting more and more agitated. Finally the official spoke. If I see you in the parking lot, he said, I'll run your ass over.

Bidzos recalls being stunned but finally he replied. "I'll give you an opportunity to retract that or apologize," he said. But the man kept pressing. I'm serious, he raged. You don't understand me, do you? Was Bidzos getting an official warning, sort of a Triple Fence equivalent of a Mafia kiss on the lips? Should he avoid parking lots? Bidzos felt that most likely the guy was probably just venting, but he didn't want to let the threat go unchallenged. He told a newspaper reporter, and the story found its way into the local paper. Not long afterward Bidzos received a phone call from the NSA guy's boss. Bidzos got an apology. Even if his life wasn't at risk, though, Bidzos felt that the agency wanted him out of business.

But at least Bidzos wasn't under the threat of indictment. That fate was reserved for his sometime nemesis Phil Zimmermann.

Ever since the release of Pretty Good Privacy, Zimmermann had assumed that his biggest problem was the intellectual property dispute with RSA. Jim Bidzos thought nothing of publicly attacking Zimmermann, and at the drop of a fax button, he would zip journalists a copy of Zimmermann's (ambiguously) written promise to stop distributing PGP, a vow apparently not kept in spirit. But Zimmermann never thought that he would find himself under criminal investigation. So when two women from the U.S. Customs Service in northern California came to visit him in 1993, he assumed that they were there at Jim Bidzos's bidding.

Indeed, though the investigators wanted to know how PGP was distributed, many of the questions dealt with PGP's similarity to RSA's products. As far as technological expertise, the investigators seemed clueless. Zimmermann had to explain to them the very basic ideas of crypto and software distribution. When they left he felt that he had little to worry about. The whole thing was some Bidzos harassment, he figured. "I don't think that there will be action against me," he said at the time. "They raised questions about the [export regulations], but I diffused that."

Not quite. United States Attorney William Keane was indeed concerned about a possible export violation. After all, within hours of PGP's release on the Internet, the strong crypto program had found its way overseas. It's unclear whether pressure from Washington had anything to do with it, but some weeks later, Keane informed Zimmermann that he was under investigation for illegally exporting munitions. (Kelly Goen, who had identified himself to MicroTimes columnist Jim Warren as a Johnny Appleseed of PGP, was also a potential target.)

For the next three years, Zimmermann was in legal purgatory, investigated by a grand jury but unindicted. His lawyers advised him to lie low. But PGP's fame had given Phil Zimmermann a taste for speaking out loud. Besides, he felt that his best chance lay in taking the case to the public. Whenever he had talked to just plain folks about PGP and crypto issues, they had become outraged at the prospect of the government's limiting the ability of people to communicate privately. He suspected, with good reason, that even techno virgins would be equally indignant at this new atrocity: here was Big Brother himself, contemplating a prison cell for someone who freely distributed privacy software to freedom fighters, lovers, and those who simply felt that their secrets were nobody's business. What's more, the case against Zimmermann himself was weak; he wasn't even the one who'd posted his program to the Net. The guy who had had told Jim Warren that he scrupulously limited the uploads to American sites. Was the Justice Department actually asserting that export restrictions prohibited U.S. citizens from distributing legal materials to other U.S. citizens?

Oh, the export regulations. The more you looked at them, the weirder they appeared. One recent controversy involved Bruce Schneier's 1994 book, Applied Cryptography. It was a technical cornucopia of cryptological mathematical theory, explanations of popular cryptosystems, and all the algorithms that a security specialist or cypherpunk would ever need. The Millennium Whole Earth Catalog called it "the Bible of code hackers." But while anyone could ship the physical book overseas, the crypto restrictions seemed to ban the export of those same contents in digital form. At least that's what cypherpunk Phil Karn found out when he applied for a "commodities jurisdiction" (or CJ) to export the book, along with an accompanying floppy disk with the same contents on it. Officials confirmed that the book could be exported, but not the floppy. It seemed absurd.

So Zimmermann talked, and generated publicity. He seldom failed to note that Burmese rebels reportedly used PGP to avoid the deadly consequences of being discovered in antigovernment activities; in testimony to a congressional hearing in 1993 he also noted that he'd received an effusive thank-you from a Latvian patriot who claimed, "your PGP is widespread from Baltic to Far East and will help democratic people if necessary." When confronted with the charges from law enforcement agencies that PGP was particularly useful to criminals—in one Sacramento case, the cops couldn't read a pedophile's diary encrypted with Zimmermann's software—he argued that all technology has trade-offs. Perhaps the highlight of Zimmermann's odd celebrity came one day in San Francisco when some businesspeople decided to take him for an evening on the town that wound up at a North Beach strip club.

The young lady lap dancing in proximity to Zimmermann asked casually what he did. "I'm a cryptographer," he said. "I wrote a program called PGP."

The lap dance stopped in midgyration. "You're Phil Zimmermann?" she asked in awe. "I know all about PGP!"

True, cypherpunk sex workers were not everyday occurrences. But PGP's audience was beginning to extend beyond techies and privacy nuts. The Wall Street Journal described how PGP was used by lawyers maintaining electronic confidentiality with clients, authors protecting their works in progress from copyright infringers, and an astronomer staking his claims to his celestial discoveries. In order to entice commercial audiences, Zimmermann had licensed the code to a company called ViaCrypt. Since ViaCrypt already had paid a licensing fee to RSA, it could sell PGP to business customers without fear of a lawsuit. (Supposedly paying two license fees was worth it, since PGP had become, by virtue of its underground following, a wonderful brand.) Beginning in 1994, the main distribution point for the much more popular freeware version was an unexpectedly mainstream ally, the Massachusetts Institute of Technology. Some there, notably professor Hal Abelson and network manager Jeff Schiller, believed that the Institute should be allowed to provide Americans with programs that they were legally permitted to use—and do it on the Internet, which was by far the most expedient method of software distribution. So MIT stored the latest versions of PGP on its Internet server and allowed anyone to download it—after asserting that they were, indeed, Americans.

The honor system obviously wasn't what the government had in mind when establishing the export laws. So flimsy was the MIT protection against export that copies of PGP downloaded from its site were spotted outside the country two days after the program was made available. Still, the citizenship restriction apparently was sufficient for MIT to avoid official complaints, let alone a criminal investigation. Not that the government officially approved of the arrangement. In one memorable session at a 1995 conference, MIT's Jeff Schiller and NSA counsel Ronald Lee (who replaced Stewart Baker in 1994) faced off. Despite repeated pleas to make some sort of statement about whether MIT's restrictions were sufficient, Lee refused to draw even the vaguest guidelines for what was permissible and what could land you in jail. Meanwhile, the MIT Press published a book (those analog dead-tree artifacts were still around) that contained nothing but hundreds of pages of C source code—the entire PGP program, formatted so that computer scanners and character recognition software could easily transform the printed hard copy into a real-life industrial-strength crypto product. It seemed almost surreal that such a scheme could be legal while a grand jury still contemplated indicting Phil Zimmermann, but that was the shaky state of crypto export policy in 1995.

Another crypto rebel faced with intrusions from the nasty real world was Julf Helsingius, the Finnish programmer who ran one of the first, and certainly the most popular, remailers in the world. By 1995, his operation called Penet was a shining example of crypto anarchy, stripping identification from thousands of messages each week, and sending them off on their merry anonymous way. Its operator was himself becoming well known in certain circles—and reviled by government doomsayers who warned that such services would prove the end of civilized society itself. But when the real trouble came it was not instigated by a government, but a private group: the Church of Scientology.

Scientologists had been routinely incensed by the criticisms of unhappy former members on Internet discussion groups. In some cases, these apostates had obtained church documents and were posting them on the Net. Scientology officials wanted to charge these people with violating the church's copyright and trade secrets. But since the addresses of the critics were laundered through the cypherpunk remailer system—very often on Penet, as it turned out—there

was no easy way to find who was responsible for the messages.

Then it turned out there was a way. Penet—unlike many of the cypherpunk remailers—was "two way," enabling people to respond directly to anonymous postings. This required a means for Julf's system to keep track of who was sending messages. First, church lawyers wrote a letter to Helsingius, formally notifying him that his service was forwarding mail that violated their copyright. Julf politely replied that his policy was to keep hands off the traffic going through his computers. Didn't they "get" remailers?

The lawyers wrote back, threatening legal action. Helsingius, in Finland, figured that the chances were slight that these faceless attorneys in California could do any such thing. Then Julf Helsingius's phone rang. It was a representative of the Church of Scientology, in person. In Finland.

Would Julf like to be taken out for dinner?

No sense in turning down a meal, Julf figured. He suggested a Thai joint. The man was friendly, saying that he was a retired policeman, and that all he wanted was two things: for the messages to stop, and for Helsingius to let him know who was sending them.

"I'm sorry," said Helsingius, "I can't do that."

But the Scientologists were not relying on Julf Helsingius's good will to cough up a name. They filed a complaint with the Los Angeles police, charging that their stolen property was being shipped over the Internet, and fingered Julf as someone willfully withholding the identity of the thieves. In Finland, that's a grave crime, sufficient to get a search and seizure warrant.

About a week after apologetically turning down the retired cop, Julf Helsingius got another call—from the Helsinki police. We have a court order, they told him, and must take your computer away so it can be searched. Helsingius's heart sank—he knew that he had to comply. (Ironically, if Helsingius had used readily available crypto software to encrypt his data and protect his customers, such a search would have proven useless. But because of "performance reasons"—"the database is huge," he explains—he did not encrypt the contents of his disk.)

But while Helsingius knew that he had to give up the single customer whom the Scientologists wanted, he didn't want to put thousands of others at risk. Fortunately, in keeping with the cordial relations Finns have with their police, he was able to negotiate a transfer that would not require him to turn over the contents of his entire database. Helsingius simply copied the e-mail address of the offending party onto a floppy disk, and set it on the table, allowing the police to take possession of that disk. "I was not too happy, but it was a compromise," he says.

Helsingius's troubles were not over, however, because another institution of the real world was about to rain on his crypto anarchy parade: the media. The same day he handed over the disk to the police, a story ran in a Swedish newspaper claiming that the majority of all child pornography on the Internet was routed through a server in Finland. Obviously it was referring to Penet. But Julf knew that his service did not distribute such materials, since he blocked "binaries" (digital photographs). Not that people cared to check. When he tracked down the source of the information, it turned out that some child pornography ring had forged the headers on porno binaries, making it look as if the stuff came from his site when it actually was posted from a location in the United Kingdom. Still, the publicity was damaging, and became worse when a British newspaper repeated the charge, this time citing Helsingius personally as the evil middleman of Internet kiddie porn.

Meanwhile, the Scientology civil case wasn't going away; Helsingius was called to a Finnish court to explain why he shouldn't turn his names over. By then he had taken measures to protect the security of the 700,000 e-mail addresses on his server. The names still weren't encrypted, but hidden: he'd moved the computer out of his home to a storage room at a secret location. And he'd hired lawyers, though God knows he didn't have the money for that sort of thing. He claimed to the Finnish court that those who used his services were entitled to privacy. But to his dismay, the judge ruled that e-mail shouldn't have the same protections as physical mail. The whole thing had taken cyberspace a step backward, at least in Finland.

That was it for Julf Helsingius. "The decision was quite clear," he said. "There's no way you can run a server like mine in Finland." So on August 30, 1996, he shut down Penet. The ineluctable lesson was that while technology can provide crypto freedom, the real people who use it must live in the real world— where governments and regulators have the means to track them down. The real world can make things very, very complicated.

But David Chaum could have told you that, too.

The maverick inventor of anonymous digital cash—and the holder of important patents on electronic money—was having a difficult time keeping his company Digicash afloat. Though he had assembled a terrific staff of enthusiastic programmers and cryptographers at his Amsterdam headquarters, there was increasing unrest within the team. Chaum wasn't completing the important alliances he needed to get his ideas into the mainstream. The intrigue in his little group intensified when one of his former students, Stefan Brands, claimed to have devised an alternative means to produce anonymous cash, and began exploring ways to license these ideas. Chaum insisted that Brands's work was dependent on his. (Brands obtained valid patents.) Meanwhile, Digicash was still looking for the big deal.

Digicash had begun an experimental pilot program on the Internet called E-Cash. It used a form of scrip, digital Monopoly money. But it really was a test run for the prospect of true digital cash on the Net, a form of currency that would one day usurp folding bills and metal coins. For now, though, a user could get 100 "cyberbucks" simply by asking. The digital tokens could be e-mailed to friends or used to "buy" things from any merchants who decided, in the spirit of experimentation, to accept cyberbucks. All of this was done anonymously. Though one participating merchant was the Encyclopedia Britannica, which took Chaum's pretend money in exchange for its articles, most of the extremely limited universe of E-Cash merchants was ad hoc operations like "Big Mac's Monty Python Archive Shop," which offered unauthorized transcriptions of that comedy group's routines for various increments of cyberbucks.

When Chaum finally did break some news, it was with a Midwestern institution with a name more familiar to literature students than international financiers: the Mark Twain Bank. The idea was to deliver a version of E-Cash where the units finally could be exchanged for real money, backed by Mark Twain.

Then, perhaps, larger institutions would jump in. At that point Chaum's critics—one of whom dismissed his ideas as Walden Pond meets the Internet—might shut up. But the Mark Twain scheme never took off.

It wasn't just Chaum who was having difficulties establishing crypto cash as an Internet standard.

Electronic commerce hadn't taken off quickly enough, and the still-evolving standards of the Net made any sort of crypto-cash scheme relatively hard to use. Chaum's competitors were unfettered by the moral obligation to provide anonymity to their digital money—they generally felt that people really didn't demand it. But those companies were falling short of expectations as well, among them the well-funded start-up Cybercash and Mondex, which allowed consumers to download money on credit-card-sized smart cards (think of a bank cash machine on your personal computer). But those disappointments paled

beside Chaum's. It was Chaum who had the patents for anonymous digital cash. And when Digicash finally filed for bankruptcy in 1998, it was Chaum who lost the patents.

Yet despite the problems and harassments suffered by the crypto revolutionaries in the mid-1990s, their larger cause kept advancing. Skirmishes and setbacks to the contrary, it was the government that was on the run. After Al Gore first retreated by promising to amend the Clipper scheme in the letter to Representative Cantwell, the administration offered to negotiate a compromise with industry, and several meetings were held at NIST's Maryland headquarters to try and reach a consensus. Hopes were high that some scheme would be reached whereby export standards were liberalized and any key escrow would be truly optional. Some of the things that the government was saying seemed quite reasonable. But when the administration's officials unveiled the final rules, there were devils in the details. Bottom line: the export restrictions would continue as they always had and Clipper's rules were only partially relaxed (for instance, users would be offered a choice of escrow agencies). The plan earned its sobriquet of Clipper II.

Inevitably, it was followed by Clipper III, in 1996. That plan had a new angle. The idea was to give cooperating companies a carrot—if companies promised to build escrow into their future products, they'd be allowed to export unescrowed DES-strength crypto now. But in practice, this proved no more attractive than the earlier versions. The obvious relief would have been a blanket export exemption of reasonably strong crypto. Instead the government tinkered with variations of its same old policy.

One continuing problem for the administration was that foreign countries regarded any American escrow scheme with suspicion. At one point, a "crypto ambassador" was sent off to try to convince the world community that such a global solution could work for all. But since he could offer no implementation where all countries had equal access to keys, his failure was a foregone conclusion. Some members of the administration considered this shortcoming the death blow to the entire policy.

Meanwhile, spurred by complaints that American industry was losing business to foreign firms selling crypto software, Congress was reconsidering a legislative solution. In 1996, Senator Conrad Burns of Montana introduced the Security and Freedom through Encryption (SAFE) bill, designed to lift export restrictions on programs that offered a "generally available" level of crypto. (Presumably, this included DES and domestic-strength RSA.) The bill also addressed fears that the government might one day declare that Clipper technology would be the only permissible crypto: SAFE would specifically forbid mandatory key escrow. Burns, a crusty Westerner who felt more comfortable seated on a saddle than in front of a computer screen, was tickled at his new reputation as a high-tech privacy crusader. But the bill itself sat bottled in committee, as legislators still swayed by NSA's well-orchestrated briefing stifled what the spooks continued to warn them was a threat to national security. "Some people here fully understand the issue," complained Senator Patrick Leahy, an early SAFE supporter. "But with others, they're talking like it was ten years ago, about an industry where ten days is an eternity."

If the government's goal was simply to stall—each day the dike doesn't crack, we win—then its approach could be considered a success. But as the cypherpunk attacks against export-strength crypto demonstrated—and the interception of unencrypted cell phone conversations, including the House Republican leadership, dramatized—such a policy had its perils. The country lacked a strong electronic security system, a vulnerability that became more serious as the Internet wound itself more deeply into the fabric of American life.

That, at least, was a key conclusion of a major study by the National Research Council (NRC). That organization, the research arm of Congress, undertook a comprehensive examination of the national crypto policy, and recruited a panel of experts from all sides of the issue, including former cabinet members, officials from the NSA, and critics from business and academia like Ray Ozzie and Marty Hellman. Their report, "Cryptography's Role in Securing the Information Society," was a surprisingly strong criticism of government policy, and recommended continued freedom for domestic encryption, relaxed export controls, and, above all, "a mechanism to promote information security in the private sector." In other words, more crypto.

Perhaps the most interesting observation of the study came as a result of the classified briefings its members had received. (Three of the sixteen members declined clearances and did not attend.) Though they could not of course reveal what they had heard in the briefings, they could—and did—evaluate the importance of that secret knowledge in determining national policy. Answer: not much. "Those [classified] details . . . ," the report stated, "are not particularly relevant to the larger issues of why policy has the shape and texture that it does today nor to the general outline of how technology will and policy should evolve in the future." So much for the "If you only knew what we know" argument.

Some people in the administration chafed at that conclusion. (In the NSA, there was even some unhappiness that the title of the report could be read as an acronym, CRISIS.) They conceded that the classified briefings given the NRC participants were thorough, but contended that to really understand the issue, you have to live and breathe intelligence. Sure, Marty Hellman or Ray Ozzie understood in theory that it was important to wiretap a crook or intercept a terrorist's call on a cell phone. But every morning the president and the vice president got nice thick books that zeroed in on the world's pressure points—everything from cracked diplomatic dispatches to the car-phone conversations of Russian mafiosi. The Clinton people knew damn well that if crypto was universal, significant hunks of those books would disappear.

But that fine point was lost on the general public—and indeed on much of Congress, which commissioned the study. Instead, the NRC report stood as a call to arms to drop the silly restrictions against crypto and start using it to strengthen our own systems. After all, it argued, the genie's out of the bottle. And quietly, some of the staunchest defenders of government's control of crypto were themselves admitting it, too.

Then another front opened in the crypto wars. For the first time, export regulations were facing a serious challenge in the courts. A decade earlier, the NSA's Bobby Ray Inman felt that he had successfully fended off the 1978 opinion of a Justice Department lawyer that the export regulations violated the First Amendment. But no judge had ever addressed the issue. Many legal experts thought that if a ruling did come on the question, it might not be to the liking of the crypto community. Indeed, a recent decision involving cypherpunk Phil Karn's legal challenge to export the floppy disk version of Applied Cryptography ended in flames. Rejecting the idea that the same information permitted for export in hard copy should be provided the same privilege in digital form, a federal judge had not only denied the request but also delivered a withering opinion on Phil Karn's request, virtually accusing him of an immoral attack on national security. But that was a sideshow to a more important suit: that of Daniel Bernstein.

Bernstein was a graduate student at Berkeley. He'd become interested in crypto and security after someone hacked his own computer account in 1987, and thereafter wanted to include crypto algorithms in his course work. As a reflection of how times had changed, courses focusing on cryptography were now almost mainstream. Technically, though, regulations seemed to forbid anyone from placing a crypto concoction somewhere a foreigner might see it. Which was exactly what Bernstein wanted to do.

Bernstein's project was inspired, coincidentally, by something Ralph Merkle had produced at Xerox PARC in 1989: a hash function called Snefru. Written in 1990 when he was an undergraduate at NYU, Bernstein's addition to Snefru playfully tweaked the illogic of the export codes. He knew that while encryption programs were subject to restrictions, hash functions like Merkle's (which don't scramble information per se) were not. So Bernstein wrote a program that transformed the hash function Snefru into something that could perform encryption and decryption. (Think of Snefru as a banned automatic weapon shipped

through customs without a trigger, and the new program as a kit that installs the missing part.) “It takes any good hash function and turns it into a good encryption function,” he later explained of his creation. He called his crypto package Snuffle and wrote a paper to describe what he’d done. But he was worried about publishing it, figuring, he later said, that “the government might not be too happy about me pointing this out.” So he put Snuffle on the shelf.

But at Berkeley in 1992, he reconsidered. Why not publish Snuffle? After all, it was not a commercial product but an academic exercise. Since the actual encryption relied on an already-published hash algorithm—he introduced no original encryption algorithms of his own—it presented no threat to the republic, so why would publishing it be a problem? The obvious place to release it was the sci.crypt discussion group on the Internet. But before uploading Snuffle to sci.crypt, he decided to take one final precaution to make sure he wasn’t violating any laws. He would ask someone in the government if such a step was permissible.

That little step kept Snuffle off the Internet for the rest of the twentieth century.

Bernstein’s first problem was identifying the proper government office to handle his request. After a series of queries he finally wound up at something called the Office of Defense Trade Controls. He sent his letter off in June 1992. To his dismay, the reply, signed by William B. Robinson, the director of that mysterious office, asserted that distributing Snuffle without a license would indeed put Bernstein in legal jeopardy.

Okay, Bernstein figured, I’ll go through the formality of getting the commodities jurisdiction—the “CJ.”

First, though, he hoped that the Office of Defense Trade Controls would clarify what his rights were, and what appeals he might have if he disagreed with a government decision. It took him until March 1993 to get someone to talk to him. Finally he got Charles Ray, the special assistant to William B. Robinson, on the horn. (Bernstein taped his conversations, with permission.) Basically, Ray told him that his rights were, well, nonexistent. If he posted Snuffle on the Net without clearance, and some foe of the United States downloaded his program from a terrorist base in Afghanistan or an apartment in Paris, Bernstein might have to scope out a jail cell for his next home. “There are no exempt groups,” Ray told him. “If you’ve got something considered technical information covered by the Munitions List . . . then being a member of the press [or an academic] does not provide you with any sanctuary. . . . You can still be prosecuted.” But what about the First Amendment? he asked.

“That freedom carries with it a responsibility to comply with the existing legislation and regulations” was Charles Ray’s interpretation of the U.S. Constitution.

A month later, Bernstein finally reached Ray’s boss, William Robinson, who confirmed that a CJ would be required before Bernstein could distribute his work. Subsequent conversations with government officials were even more frustrating. Not only was Internet posting forbidden, but Bernstein might be prosecuted even if he placed a copy of his paper in a public library. Of course, the National Security Agency became involved, as it always does in export cases of new crypto systems. Eventually, Bernstein managed to have some conversations with NSA representatives, learning that behind the Triple Fence some people considered Snuffle “strategic.” This meant, he inferred, that it was not trivial to break. “They offered to help me rewrite it to make it not strategic,” says Bernstein, but he deemed such a move counterproductive.

So he’d play the game. In September 1992, Bernstein filed for five separate CJs. He’d broken the problem up into different versions—ranging from English-language descriptions of the system to mathematical formulas—“to see where they’d draw the line.” Could the government consider each one a “defense article”? He still maintained a belief that at some point the fog would clear from a bureaucrat’s eyes and he would finally realize that Snuffle was simply one graduate student’s academic work, not a weapon. But in October 1993, the government replied that yes, each one of his mathematical formulas was a weapon, “subject to the licensing jurisdiction of the Department of State.”

Bernstein hadn’t begun the process as a rabble-rouser, but now he was himself thoroughly roused. He continued to pursue the case with a methodical patience that would prove devastating to the U.S. government’s eventual defense of its export regulations as they applied to Snuffle. He appealed the first CJ. When months passed without a response, he decided that he needed help.

His benefactor was John Gilmore, no stranger to court battles against the government. The senior cypherpunk already had accumulated a file cabinet’s worth of documents with Freedom of Information requests originally withheld but later kicked loose by legal appeals. Gilmore referred Bernstein to a lawyer named Cindy Cohn, who took the case pro bono (the Electronic Frontier Foundation helped with the costs and coordinated the effort with supplementary counsel). In early 1995, Bernstein and the EFF filed a complaint against the State Department, charging that the export laws were unconstitutional. At the center of the case was the contention that Bernstein’s computer source code was a form of speech, and that by preventing its publication, the government was denying Bernstein’s right to express himself.

That 1978 opinion—that the regulations might flout the First Amendment—was finally about to be tested. But few thought that a judge would resist the government’s inevitable claim that the export laws were crucial to national security, and that striking them down would unleash the modern-day version of the Four Horsemen of the Apocalypse: drug dealers, kidnappers, child pornographers, and terrorists. The case was tried before Judge Marilyn Patel in the Northern California District Court. One of her first acts did not seem promising for the plaintiff: she ordered the trial exhibits sealed, since the export rules forbade their distribution. But as the case progressed, Judge Patel proved to be more than sympathetic to Bernstein’s claims. Perhaps sensing this, the government tried a number of tactics to get the suit out of her court. It reversed itself on two of the five CJ determinations, admitting that those particular mathematical decisions were simply “technical data.” It argued that Judge Patel’s court had no jurisdiction in matters involving export law. It filed for immediate dismissal. But on April 27, 1996, Patel decided the case should proceed. The reason was enough to make a government regulator’s blood run cold: Judge Marilyn Patel had determined that at least part of the encryption export control rules was indeed unconstitutional. Furthermore, she accepted the Bernstein team’s assertion that computer source code could be considered a form of speech. Which meant that the much stricter First Amendment rules regarding prior restraint applied to Snuffle. As far as Judge Patel was concerned, this wasn’t about keeping a weapon within our borders. It was about illegally suppressing an opinion. That summer, Patel officially affirmed her preliminary decision.

The government appealed to the higher Ninth Circuit court. By then Bernstein had received his doctorate and was teaching at the University of Chicago. He wanted to teach a course involving cryptography, but because of the continuing case, he required a government waiver to do so. It took another judicial ruling before he was finally permitted to distribute materials about his work—and then only to his students. The course was taught without discernible damage to the nation.

But still the case dragged on. Oral arguments before a three-judge panel were scheduled for December 1997. Conventional wisdom had it that the appeals court would strike down what was seen as an impudent ruling from a judge who, after all, sat on the bench in wacky San Francisco. But in the packed courtroom, a rather harried government lawyer, a man of baby-boom vintage with experience before higher courts, was questioned harshly by the judges. The panel seemed more impressed with Bernstein’s advocate, Cindy Cohn, a diminutive woman in her early thirties, who, despite an occasional wavering in

her voice, presented her arguments forcefully. One unexpected point she made was that by preventing publication on the Internet, the government was failing to heed the recent Supreme Court decision that struck down a law known as the Communications Decency Act: the court had ruled that the Net was a beacon of democracy entitled to the highest level of First Amendment protection. Cohn also urged the judges to consider the implications of not allowing crypto to thrive: was it proper for the government to deny the tools that citizens might use to safeguard their privacy?

The three-judge panel pondered the case for more than a year, not handing down their ruling until May 1999. For Daniel Bernstein, it was worth the wait. By a two to one margin, they issued a broad opinion that not only affirmed Patel, but also went even further in celebrating cryptography itself as a vital component of democracy. Crypto should not be merely a state secret, they wrote, but also a protector of the people's privacy. Somehow these two technologically unschooled jurists had gotten it. "Government attempts to control encryption . . . may well implicate not only First Amendment rights of cryptographers," wrote Judge Betty Fletcher, "but also the constitutional rights of each of us as potential recipients of encryption's bounty."

Encryption's bounty? Judge Fletcher was a cypherpunk in robes!

The afternoon that the decision came down, Bernstein was proctoring a calculus exam in Chicago. Only afterward, when he checked his e-mail, did he learn that he had clobbered the government.

The government appealed of course—but the export rules it was defending were looking less and less likely to survive. For years, the crypto dike had held admirably. But now it was crumbling. It was endgame for the government.

Oddly, the NSA no longer appeared to be the prime obstacle to a solution—behind the Triple Fence one could discern a sense of resigned acceptance of the new crypto reality. Clint Brooks himself was no longer on the front lines, but ultimately the institution he served had come to accept his idea of change.

Maybe its leaders recognized that instead of trying to hold back progress, their efforts might be better spent trying to prepare for the inevitable. Probably, when the NSA cipher wizards had really thought about it, the putative nightmare of crypto everywhere was something they felt they could handle—if they were granted more funding, of course. Perhaps, as Robert Morris hinted in his Crypto '95 speech, and the cypherpunk-cracking effort had indicated, these shiny, "uncrackable" programs created by the private sector really weren't so uncrackable after all, and the NSA was satisfied at its ability to get plaintext when it needed to. One caper funded by the Electronic Frontier Foundation had been particularly telling: a team of engineers led by John Gilmore and Paul Kocher had built a DES-cracking machine for $210,000.

(DES, of course, was still deemed a munition too hazardous to send abroad in normal circumstances.) In a demonstration at a 1998 crypto conference, the device produced the plaintext to a DES message in less than twenty-four hours. Obviously, if such machines were produced in bulk, obtaining such keys would be dirt cheap. One had to assume that the NSA had plenty of similar units in its basement.

In any case, it was the FBI, particularly its director Louis Freeh, that kept urging a hard line—even to the point of continuing to insist that the bureau should have access to plaintext even at the cost of regulating crypto within U.S. borders. Freeh had finally managed to get a version of the Digital Telephony bill passed, presumably forcing the telecommunications industry to design its products to be wiretap friendly. (Congressional opponents of the concept, however, had foiled its intent by refusing to budget the hundreds of millions of dollars needed to implement the effort.) But Freeh continued to fear that crypto would be the death of wiretapping. Since 1994, he had been demanding publicly that if his agents were unable to get plaintext from their wiretaps, Congress should institute a new era of prohibition by banning unescrowed strong encryption. "The objective is to get those conversations, whether they're [conducted] by alligator clips or [by] ones and zeros," he said. "Whoever they are, whatever they are, I need them."

But Freeh was no longer a Clinton administration favorite, and White House officials shrugged off his remarks.

Not that the administration had given up its hopes of stemming the cipher tide. It's just that with each iteration, its anticrypto vision got flimsier and flimsier. White House apparatchiks insisted that the changes were all in the spirit of Al Gore's willingness to work with stakeholders in the crypto world to find the proper balance between codes and snoops. But the only direction that Clinton's people were going was backward. "The boat was getting shelled," Mike Nelson admits. The surest sign that a policy is in big trouble is when the words used to describe it are so discredited that they require euphemisms. By 1997, the word "escrow" became verbum non gratum, despite the fact that thousands of Clipperequipped phones had now been purchased, their keys gathering digital dust in the prescribed escrow facilities. Now the stated goal was called key recovery. A policy that began with the firm controls of Clipper—secret algorithms in tamperproof hardware, government-controlled escrow facilities—had been modified to a software-based scheme where users could choose their own, privately run escrow facilities. Another compromise: the formerly top-secret Skipjack algorithm was finally made public.

"We're not stupid," one administration official later explained. "We listened to the marketplace." But the marketplace—meaning real people trying to buy, sell, and use crypto—didn't want any part of an escrow scheme.

Meanwhile, Congress was discovering the confidence to follow that market, rather than fall prey to the administration's doomsday scenarios. Probably the most important factor was the rise of a well-organized lobbying effort by the computer industry. Since (now former) Representative Maria Cantwell's kamikaze run at the export laws, the high-tech crowd had learned a lot about what the white-shoe contingent could do for them. Regulatory warriors like Bruce Heiman of the Business Software Alliance had made crypto their cause célèbre. Their alliances with civil liberties groups like the Electronic Privacy Information Center, EFF, and the Center for Democracy and Technology gave them populist street cred. The lobbyists met with crucial administration officials so often that either side could flawlessly complete the other's sentences. And they cleverly identified the legislators who would promote procrypto bills, not so much in anticipation of actually passing them, but to increase the already considerable pressure for strong-crypto détente. The lobbyists' prize converts were a conservative Republican from Virginia, Robert Goodlatte, and a new-economy Democrat representing Silicon Valley, Zoe Lofgren. Goodlatte in particular was a firebrand on the issue, a newly born crypto head in pinstripes. "The first thing we did was have him spend time with the NSA on this, so he could hear the point of view from the other side," says Heiman. After being inoculated by a full-contact classified briefing, Goodlatte then was served the alternative reality: crypto was already abroad, industry was in danger of losing billions, and so on. Once the congressman adopted the outsider's vision, he appeared so often with Internet industry leaders that it was a shame he was ineligible for stock options.

Helped by a newly formed industry group called Americans for Computer Privacy (those "Americans" were thirteen corporations including RSA, IBM, Novell, Sun, and Microsoft), Goodlatte and Lofgren educated their colleagues on the political benefits of supporting strong crypto. In the Senate, the unlikely crypto crusader Conrad Burns of Montana took on the administration, backed by privacy-savant Patrick Leahy and the senator from Microsoft, Washington's Patty Murray.

A dramatically different variation on The Briefing was coming into vogue in congressional hearing rooms. Instead of shrouded conversations about maintaining our successes in codebreaking, witnesses were warning of potential disasters caused by outsiders screwing up our own systems—which were vulnerable, in part, because the world's most advanced technological nation had failed to adopt strong crypto to protect those systems. Every corruption of

a Web site and theft of on-line credit-card numbers seemed to reinforce those fears; the conclusions of the National Research Council were finally resonating.

Even the FBI's Web site got hacked! Capitol Hill was suddenly abuzz with the prospects of a "digital Pearl Harbor," where hackers, terrorists, and hostile nations would grind our society to a halt by shutting down computer-controlled functions like the electrical grid or weapons systems. And though there was no magic bullet that might shore up our defenses, we did have a powerful tool to protect ourselves: strong crypto, the very thing that the administration had been trying to suppress!

By 1999, an emboldened Congress was finally rallying around the SAFE bill, the three-year-old proposed legislation to relax the export rules. In fact, a majority of the House—258 members—had signed on as cosponsors. In the Senate, the news for the administration was no better. Its leader in the fight against relaxed export controls had been John McCain, the former Vietnam prisoner of war whose credibility on such matters was unimpeachable. A bill McCain and Senator Bob Kerry had introduced in June 1997 would deny the services of any future government-sponsored "certificate authorities" (agencies to distribute and authenticate public keys, a necessary component in a full-blown crypto infrastructure) to those who refused to escrow their keys—potentially giving citizens the choice of either using Clippertype schemes or losing their ability to participate in the electronic society. But by 1999, McCain had looked more closely at the issue (and perhaps its impact on his pending presidential run). In a stunning switcheroo, McCain suddenly turned into Mr. Crypto, a vocal supporter of the SAFE bill.

Was it time for the administration to finally toss its export forms in the air and yell "ciphertext"?

Apparently so. Even though the administration never really believed that Congress would pass a bill demanding liberalized exports—the system was too convoluted to tackle, the risk of compromising national security too dicey, and in any case there was always the promised presidential veto—the White House was distressed and anxious that votes in the subcommittees kept the issue alive. More to the point, the Clinton people began pondering the potential consequences of a national disaster resulting from a lack of crypto—for which they could be blamed. Sure, allowing crypto exports could be dangerous, they figured, people may die . . . but on the other hand, if someone attacked an unprotected digital infrastructure . . . people may die! As one White House policy maker later explained, it came down to how they would die: "Do you want them shot out of the sky with a surface-to-air missile, or do you want the floodgates on the Grand Coulee Dam to be rewired?" If the whole issue boiled down to six of one against half a dozen of the other, what was the sense of fighting such a thankless, uphill battle?

In September 1999, Al Gore—himself preparing for a run at the White House—announced that a new set of regulations would be unveiled in December: the net result of which would be permission to export consumer-directed crypto products in any key length. So drastic a change was this that upon being briefed on the policy, Curt Weldon, a Pennsylvania congressman who had carried serious water for the administration in fending off the SAFE bill, could not contain himself. How can you be implementing this policy? he shouted. For years, you've been telling us that exports of strong crypto will compromise security and empower criminals. And now you're telling us you've changed your minds?

"It's over," concluded Stewart Baker, who since leaving the NSA in 1994 had returned to his law firm to practice cyberlaw. Some suspected that the whole thing was yet another government stalling tactic; at the last moment, the regulators would unveil a plan loaded with fine print that represented very little change. Just like Lucy snatching away the football when Charlie Brown was ready to boot it, they imagined, the NSA and the FBI would once again deny the crypto community the ability to export strong keys. But by now it was clear that the game could have fewer and fewer iterations before Charlie would finally, inevitably put toe to pigskin.

This time, in fact, the government made good. The first draft of the regulations seemed to dictate an alarming amount of red tape before strong crypto could be granted an "automatic" exemption—but tactful yet firm opposition from the Goodlatte-Lofgren faction and the industry led to a more commodious second draft. Not perfect, but sufficiently straightforward to assure even the paranoid that this time the good stuff could be sent abroad. No longer was a 56-bit DES key, or even keys of 64, 80, 128, or more bits, regarded as a deadly weapon.

If was official: public crypto was our friend.

A few days into the new millennium, it was time for the tenth-anniversary gathering of RSA's annual cryptography conference. The gathering now had outgrown San Francisco's largest hotels and was held at the mammoth San Jose Convention Center. It had become a huge crypto bazaar with a conference program with five separate tracks of seminars and over ten thousand people in attendance.

Almost every year at the show, one of the keynote sessions tracked the progress, or lack of progress, of cryptography in the political realm. It would play out almost like Kabuki theater, with aggrieved representatives from the commercial, academic, or civil liberties world griping about the intransigence of the government. Then some unlucky emissary from the administration—an assistant attorney general, an NSA lawyer, a White House techno-policy wonk—would lecture an unforgiving crowd about the ineffable balance between privacy and national security, perhaps inflaming the gathering by an ill-placed "If you knew what we know" reply to one of the inevitably hostile questions. But this year it was different. Jim Bidzos came to the podium with a bottle of champagne, offering it to the people from Justice and the NSA on the panel. The fight is over, he was saying, and our guys won.

Bidzos himself was no longer working full time, partly as a consequence of the June 1996 acquisition of RSA Data Security by an East Coast computer security firm called Security Dynamics. (Weeks before the January conference, the purchasing company decided to change its name and was now called RSA Security, Inc.) The price tag was around $300 million, of which Bidzos himself took in $40 million. Some think that the sum might have been even higher—or RSA might have been able to pull off its own billionbuck Internet IPO—had it not been for the acrimonious breakup of Public Key Partners, when lawsuits flared between RSA Data Security and its partner Cylink. The people at Cylink had become unhappy with the arrangement, and also frustrated that the original agreement did not allow them to exploit RSA technology freely in their own products; they went so far as to challenge the validity of the MIT patent on the breakthroughs of Rivest, et al. (A remarkable action, since Cylink, through PKP, received a share of the royalties from that patent.) Bidzos and his colleagues, meanwhile, were livid that Cylink had developed an RSA-based product for the global transaction clearinghouse SWIFT. The suits were finally settled in late 1996, with the assistance of a federal judge. Both sides claimed victory at the complicated settlement (Bidzos noted that there were no findings that RSA had acted improperly) but valuable energies had been expended—while the patents themselves inched closer to their expiration dates.

Not long after the sale, Bidzos figured he'd be happier with less involvement in the firm. He'd moved into a Marin County mansion, owned a sleek posse of BMW motorcycles, sampled exotic bottles of wine, practiced classical guitar, flew his minifleet of airplanes, and checked on his impressive stock portfolio.

Investments had made him a millionaire many, many times over—his personal stake in the VeriSign digital certificate company alone (which he cofounded) was worth more than the money he cleared in the RSA sale (a stake that had itself now grown to over $100 million). His main job was now as a quasiambassador of the commercial crypto cause, and his main visibility came at the annual conference. Diffie was there, of course. Still unrepentantly

longhaired and strikingly bearded, he cut a startling figure in one of his bespoke suits. Though not wealthy by Silicon Valley standards, the few million dollars he had received from his patents and RSA stock made him quite comfortable. He and Mary Fischer were still together, still very much in love, though their one-time petting zoo was now down to two Tibetan mastiffs.

Rivest, Shamir, and Adleman attended as well. Rivest was now a well-respected graybeard, still on the MIT faculty but wealthy from his RSA holdings. He was still doing original crypto research. Shamir was even more active in the field, brainstorming everything from systems for digital cash micropayments to a new computer that could factor huge numbers. But Len Adleman was pretty much out of crypto, working instead on schemes that combined mathematics with organic chemicals, like DNA computers. Some key cryptographers and figures in the struggle didn't make it to San Jose for the event. Ralph Merkle, too busy with his work at Xerox PARC in the field of nanotechnology, couldn't find the time to accept an award bestowed by RSA for significant contributions in the field. And Ray Ozzie was immersed in the development of his first major project since Notes: within weeks he would receive— fifteen years after his first frustrating contacts with the NSA—export clearance to ship 2048-bit RSA keys, 256-byte RC-4 (yes, byte—eight times more than bits!) keys, and, by the way, clearance for plain old DES as well.

Another unfortunate no-show was David Chaum. Had he attended, he might have seen plenty of things he liked. Anonymous crypto solutions like Chaum's were increasingly cited as an antidote to the unwanted transmission of personal data. One start-up prominently displaying at the conference trade show was a Canadian company called Zero Knowledge that sucked up millions in venture capital to launch its "Anonymizer," a Web site that allowed people to surf the Net without leaving their digital footprints behind.

And though Julf Helsingius didn't venture from Finland for the conference, his ideas still flourished. At the monthly cypherpunks meeting held the weekend before the event, there was the usual discussion of a new generation of remailers called "mixmasters," which used an improved technology to make encrypted anonymous Internet messaging easy to use and devilishly difficult for governments to unravel.

Phil Zimmermann, however, did manage to attend the conference. On January 11, 1996, the government had officially dropped its investigation of him and his co-target, Kelly Goen. To celebrate, Zimmermann's wife had tossed a "Phil Got Off the Hook" party at the Rocky Mountain Peace Center. Not long afterward, Zimmermann decided to move to Silicon Valley and start a company, Pretty Good Privacy, Inc., to produce the software commercially. (An RSA lawsuit filed against the new company for copyright infringement was eventually settled, with PGP paying normal royalties for public key protocols.) But PGP, Inc. was short-lived. Admittedly the kind of guy who couldn't balance his own checkbook, Zimmermann turned over the operations of his company to businesspeople who went through millions of dollars in barely the time it takes to calculate a long prime. The new company acquired other firms, had splashy displays at trade shows, and pursued an overly ambitious plan of transforming itself into a fullservice security giant. Finally, the nearly broke company was sold to an established personal computer security firm, Network Associates. Zimmermann was kept on as the official head of PGP, but his contribution came not so much as a software developer but as a living symbol of strong cryptography. It was in that iconic role that Phil Zimmermann attended the 2000 RSA conference; his best moment came at a Network Associates party on the event's second night. Standing at a computer keyboard, he made a big show of mouse clicking a file transfer that launched a copy of commercial PGP abroad. Only a few years earlier, the government wanted to throw him in jail for the same alleged act.

Later in the conference came a series of sessions focused on a so-called crypto bakeoff run by NIST to choose a successor to the now-ancient Data Encryption Standard. In contrast to the selection of DES, which was made after closed-door meetings with its creators and agreements to keep its design principles secret, the Advanced Encryption Standard was being run as an open competition, with the winner to be chosen by 2001. Not only the algorithms themselves but also the design considerations were completely public. All, as required by NIST, were much stronger than DES, with minimum 128-bit keys. It would have been difficult to argue for strong restrictions against the export of the algorithm in any case, since more than half of the contenders were written by cryptographers outside the United States.

It had taken more than twenty years since Whit Diffie's discovery—so long, in fact, that in just a few months into the new century, the suite of patents covering public key and RSA would one by one reach their expiration dates—but the era that Diffie had dreamed of was finally beginning. In a keynote speech following Bidzos, a vice president at Microsoft announced that its new operating system, Windows 2000 —variations of which would undoubtedly find their way into almost every personal computer sold in the new century—would have 128-bit crypto built in, with government clearance to export it. And Apple Computer was already shipping strong crypto in its new operating system.

And, of course, crypto was already a component in every Web browser, enabling the secure transfer of credit-card numbers and financial information. In 2000, there would be over $80 billion worth of ecommerce transactions—a number that was estimated to eventually shoot into the trillions; virtually all of that was protected by RSA crypto. And later that year, a national digital signature bill would be passed, finally clearing the way out of the logjam caused by the administration's foot-dragging back in 1992.

President Clinton would sign the bill electronically.

The once-forbidden technology was suddenly the new panacea. It was envisioned that the solution to the pirated, downloading of music and films would be . . . crypto. In addition, crypto was the secret sauce of protected corporate discussions used in "virtual private networks," a hot business trend that allowed snoop-proof conferencing. The movement of medical records to the on-line world would be possible only with crypto. And crypto was expected to be an essential component in the next generation of the Internet, where all of us would communicate with non-personal-computer "devices" ranging from palmtops to phones to kitchen appliances. We would be wired and wirelessed up the wazoo, and crypto would be our privacy safety net.

To be sure, its revolutionary impact would be stealthy. The hundreds of millions already using it in browsers and operating systems, for instance, knew nothing of Whit Diffie and the others, even as their machines silently made key exchanges and scrambled, unscrambled, and successfully completed transactions with secrecy that would stagger the medieval occultist Trithemius, stun autokey wizard Vigenère, and perhaps bring a wistful smile to Lucifer's creator, Horst Feistel. Why didn't it happen sooner, as Diffie had expected? Because it wasn't until the Internet that it had to happen.

So there was reason to celebrate at the 2000 RSA conference. But those wondering why the turnaround had come so quickly would have found a succinct answer one year earlier—same season, same place, at the 1999 conference. That event had opened with the soaring vocalists of the Oakland Interfaith Gospel Choir. Decked out in electric blue robes, they filed onstage, booming out a holy-roller version of the rock song "I Still Haven't Found What I'm Looking For." The lyrics had been changed to refer to the long struggle for widespread, strong encryption. But when Jim Bidzos himself hit the stage, similarly berobed, his preacherlike testimony presciently claimed that the clouds were parting, the rainbow just ahead. If not crypto anarchy, he knew, crypto ubiquity was on the way. He realized that for all those years he'd been flogging the public key dream, he'd been pushing a boulder uphill. But the problem hadn't been only the government or the export regulations, but the product itself. Public key cryptography was a mathematical marvel, but it had actually been born too soon. Twenty years ago, it was a solution whose problem hadn't fully materialized.

No more. Not when every desktop had a computer on it and was connected to the Internet. Not when nearly every lap had one of the things, too. Not when phones were beginning to get hooked to the World Wide Web, along with set-top television boxes, and even videogame consoles. Certainly not when all those Net-connection devices were being used to shuttle everyone's private information, and even their credit cards. Especially their credit cards.

Jim Bidzos looked at his audience and made his own joyful gospel sound: "We've found the problem to the solution," he said, ". . . and it's e-commerce!"

Gordon C. Culp came out of Auburn, Washington, during the Great Depression, and never forgot his roots or his old friends. He went on to become a counsel to United States Senator [**Henry Martin "Scoop" Jackson (born 1912)**] ,co-founder of the Culp, Dwyer, Guterson & Grader law firm in Seattle, influential Pacific Northwest power-utilities attorney, University of Washington Regent, University of Washington Medical Center board member, and the key

Pacific Northwest power utilities attorney, University of Washington Regent, University of Washington Medical Center board member, and the key negotiator in bringing together the Seattle Cancer Care Alliance. He attributed his success in life to luck. In the words of one of his obituaries, "He had great credibility with public power leaders, federal officials and Washington's congressional delegation" (Shaw). Culp was content to be an out-of-the-spotlight negotiator, bringing disparate groups together in common cause. A former law partner said, "His roots were so deep, his comfort with himself was so deep, he didn't have to pander to people" (Marritz). He was a wordsmith, raconteur, and debater who relished discourse but had little patience for uninformed opinion. He was devoted to public service, and to the University of Washington.

Rural King County Roots

Gordon C. Culp was born on February 17, 1926, in Auburn, Washington, to Norman and Cara Virl Carter Culp, the third of four children. His father was 45 and his mother was 37. His siblings were sisters Shirley, who died in 1949, Audrey, and Wilda. Norman Culp's ancestors were religious refugees, Swiss Mennonites, and Tories who settled first in Pennsylvania, then moved to Canada, which was politically more compatible for them. Norman first came to the United States in 1906, moved back and forth a few times and in 1930 brought in a herd of polled (hornless) Herefords. He settled with his wife, children, and cattle on a rented ranch in King County's Soos Creek area, between Auburn and Black Diamond, just in time for the Great Depression.

Culp once recalled: "He saved for years and years ... and then you couldn't give (the cattle) away. He lost the whole thing, a life's work, for a $500 feed bill" (Whiteley). Norman found work as an accountant for the federal Public Works Administration, but the experience had a debilitating effect on Gordon, for years after. Whether because of it or in spite of this, young Culp excelled in school. He was a straight-A student, class president, and otherwise active in student affairs, including the debate team, drama club, and cheerleading. "I was always mouthy," Culp explained (Whiteley).

He was christened Calvin Carter Culp, but his mother disliked the name and called him Gordon. He changed his name legally in 1953.

Culp had a newspaper route and won a bicycle for obtaining the most new subscriptions. Auburn was a railroad hub, telephones were far from universal, and he also worked as a call boy, sent out to wake engineers for their shifts. Years later, he would occasionally don his old, distinctive, blue-and-white railroad engineer's cap. He regularly visited his old Auburn buddies throughout his life. Culp never lost touch with those roots.

Discovering Law

Shortly before graduating from Auburn High School in 1944, he joined the Navy, which made more sense to him than waiting to be drafted into the Army. He served as an Electronic Electricians Mate in the United States and the Philippines until 1946. His father died that year and his mother died in 1969.

He entered the University of Washington under the GI Bill, the Servicemen's Readjustment Act of 1944 that put higher education within the reach of millions of veterans of World War II and succeeding wars. Culp had enjoyed his Navy experience and was considering engineering or prelaw. "Culp remembers, 'There were lots of girls to be met and beer to be drunk,' and prelaw offered more flexibility for doing that." He majored in philosophy and economics as an undergraduate, and found time and enthusiasm to be a cheerleader. He enjoyed law school, because "It was fun to argue all day long" (Whiteley).

Culp served on the *Law Review*, was president of the Alpha Tau Omega fraternity, and graduated from the UW School of Law in 1952, with the modest expectations of a Depression child. He reflected, "I was going to get a hot job as an insurance adjuster. I was going to end up making $10,000 a year ... That was the extent of my planning" (Whiteley). That $10,000 a year was the dream for thousands of young men entering the work force in the wake of World War II.

Instead Culp joined the Seattle law firm of Ferguson and Burdell for two years, then opened his own practice. In 1957, Culp wanted to take time off to work on the U.S. Senate Subcommittee on Territories and Insular Affairs, chaired by **Senator Henry M. "Scoop" Jackson** (1912-1983). In the meantime, an old law school friend, William L. "Bill" Dwyer (1929-2002), had gone on to earn his law degree from New York University, complete a U.S. Army tour in West Germany, and was working as law clerk for state Supreme Court Justice Charles Donworth. Vasiliky Dwyer, Bill Dwyer's widow, recalled, "Gordy talked to Bill about taking over his practice, which was very little. Gordy said, 'When I get back, we can talk about maybe going into practice together.' Bill took over, got close to Charlie Burdell, who was in the same building, Charlie then brought Bill into the Dave Beck case, and that was the beginning, really, of Bill's career" (Dwyer).

Working for Scoop Jackson

Senator Jackson and other Washington state politicians strongly supported statehood for the territories of Alaska and Hawaii, though powerful interests, especially southern segregationists, opposed both. As counsel for Jackson's subcommittee, Culp was a major contributor to the crafting of both measures. The Alaska statehood bill was signed in 1958 and the Hawaii statehood bill in 1959.

By chance, another subcommittee assignment involving a plan to increase Pacific Northwest salmon runs led Culp to the region's power industry, where he would spend his professional career.

Marriage to Joan Procter Culp

While working for Senator Jackson, Culp became friendly with the senator's appointments secretary, Joan Proctor (1930-1996), and they married in 1958. When they returned to Seattle that year, she managed Jackson's Seattle office, worked on Jackson's presidential campaigns, and continued working for him until 1974. She was a Ballard native, daughter of a union organizer, and a major bulwark for Culp, her family, and others. Joan was a skilled cook who provided everything from elaborate four-course gourmet meals for 12 to whipping up gourmet delights for the gang of Husky football tailgaters that the Culps hung with.

Both Gordon and Joan Culp were voracious readers and inveterate travelers. During their 39 year marriage (until her death in 1996 after a long battle with emphysema) he and Joan enjoyed many sojourns both exotic and mundane. They traveled all over the Pacific Northwest, went fishing in New Zealand, cruising to Antarctica, riding the Trans-Siberian Express; and they were left on the beach by a cruise ship at al Àqabah, Jordan, part of their odyssey around the world. Along the way, the Culps met people who became lifelong friends -- a German military pilot wedded to a Japanese woman, a Burmese student, and many others. Culp's travel tales were always punctuated with the amazement of a boy only recently out of Auburn.

Seattle Law Firm

In 1958, Culp and William Dwyer teamed up as a law firm, with offices in the Hoge Building, the endeavor set forth in a one-page contract. Murray Guterson, another old UW School of Law classmate, joined them shortly. George Grader joined the firm in 1964, when Dwyer took a sabbatical to write *The Goldmark Case: An American Libel Trial* about a landmark suit Dwyer pursued to the United States Supreme Court.

Culp, Dwyer, Guterson & Grader began making news in a range of other high-profile cases -- some *pro bono* and highly controversial, others involving high-stakes gambles -- cheeky antitrust suits that ultimately earned the firm multimillion-dollar fees and made the *pro bono* work possible.

Culp, meanwhile, was establishing himself out of the public eye, orchestrating complicated, politically sensitive power projects and finding common ground among sometimes disparate interests -- tricky work, which he mostly shrugged off as "magoozling." (Seattle author Bill Speidel defined a *magoozle* as "a method by which we get things done in America. It's neither legal nor illegal, but it gets the job done" [Magoo website].)

Power Treaties

Culp's first major success was a landmark treaty signed with Canada in 1964 to enhance Columbia River hydroelectric potential. Robert Marritz, a lawyer who worked with Culp on energy issues, said: "They were looking for someone with political savvy, someone who knew power, and knew how to put this together -- the politics of it -- on both sides of the border. Culp had much to do with putting this complicated deal together, and the millions of dollars in benefits that flowed from it." Under the treaty, the Canadians built three dams on the upstream reaches of the Columbia River and both Canada and the United States shared the downstream benefits of the added firm power created by the new dams. The Canadians at first didn't need their share of power, so they sold their entitlement to utilities in the United States, under an arrangement known as the Columbia Storage Power Exchange (CSPE), which Culp was also instrumental in creating.

The treaty and CSPE, along with differences in West Coast geography and climate, prompted another inter-regional contract. Peak power demand in California and other Southwest states came during the summer air-conditioning season, when the Pacific Northwest enjoyed a surplus. This led to development of the West Coast interties (high voltage lines traveling great distances to link two or more electric power systems), connecting the Pacific Northwest to California energy markets. The interties permitted large seasonal exchanges of power, mostly surplus sales from the Northwest.

Culp was in the middle of it all. There were some bumps in the road, however. With development of the interties, Northwest utility lawyers became concerned about potential antitrust suits by third parties, so Culp and others, working with the offices of Senators Jackson and Warren G. Magnuson (1905-1989), crafted a bill that would exempt from the antitrust laws utilities already under federal regulation. Marritz was working for the rural electric co-ops in Washington at the time, and wondered "who's behind this thing? It was Culp and Grinstein." Working with Culp was Gerry Grinstein, a top aide for Magnuson who went on to become president and CEO of Western Airlines, chairman and CEO of Burlington Northern, and then CEO of Delta Airlines. This was the first time Marritz had heard Culp's name, never dreaming he would later become his law partner. "The bill was brilliant in its simplicity," Marritz recalled, "but it was too broad." Rather than stir up a hornet's nest, Culp and Grinstein decided to drop the bill.

Power Politics

The offices of Jackson and Magnuson were major forces in Pacific Northwest power politics -- as they were in *all* regional politics -- and former staffers, in addition to Culp and Grinstein, were scattered influentially throughout the industry. Longtime Jackson chief-of-staff Sterling Munro (1932-1992), for instance, was administrator of the Bonneville Power Administration from 1978 to 1981. One-time Magnuson aide Eric Redman represented industrial customers of BPA at Seattle's Preston, Thorgrimson, Ellis law firm, where his boss was Gerry Grinstein.

According to Egil "Bud" Krogh, a Seattle lawyer who worked for the Culp Dwyer firm and who also specialized in energy issues, the CSPE and the intertie "transformed the energy infrastructure of the Northwest. It all took root in the fertile mind of Gordy Culp ... . When this was first put together, there was an ability on the part of public power, the investor-owned utility community, the direct-service customers of Bonneville, the governments of Washington, Oregon, Idaho, Canada, BC Hydro, the U.S., and Canadian regulators, to work together. Culp was absolutely crucial because he had an ability to bring people together and get them to see the common good, and back off from very narrow interests" (Krogh).

Culp also was instrumental in developing the Pacific Northwest Utilities Conference Committee (PNUCC) into a significant industry forum-cum-lobbying group. PNUCC was formed in 1946 "as a voluntary, informal organization of public and private utilities to assess regional power supply in the West Group Forecast and to support federal appropriations for power projects in the region" (PNUCC website). The direct-services industries (DSIs) -- aluminum manufacturing firms -- which consumed one-third of the power from the federal dam system on the Columbia, became members in 1971.

Lou Nawrot, a former Culp Dwyer attorney, recalled: "Public and private power companies had their own lawyers, but they didn't speak to each other very much. Whenever there was something of common interest, they had trouble getting to a position where they could agree on anything." Robert Marritz added, "There was a need to coordinate conflicting, overlapping interests: public power -- itself diverse -- private utilities, aluminum companies, and the public interest. Culp was the titular head of the power industry legal community, figuring out these problems, trying to get the parties together to get more kilowatts out of the resource."

Politics Beckons

In 1960, Culp took a leave of absence to return to politics. He and wife Joan hit the road as an advance team for Jackson, then National Democratic Chairman and a leading vice-presidential candidate to run with John F. Kennedy (1917-1963). Kennedy, counting potential votes in the conservative-leaning South, instead chose Texas Senator Lyndon B. Johnson (1908-1973). The Culps also worked on Jackson's own presidential campaign in 1972, Gordon as scheduler. On the eve of this eagerly awaited new adventure, Culp had said, "This train only passes once." And an adventure it was. In late April 1971, with Gordon already in Washington, D.C., scheduling and writing speeches, Joan drove across the country in her 1968 Mustang – she liked sporty cars – with her 11-year-old nephew Don Devan for company, and arrived in time for the May Day anti-war riots, which shut down the nation's capital. The Culps also worked on Jackson's second attempt at the presidency in 1976.

Meanwhile, fear of an energy shortage was beginning to permeate the Pacific Northwest power industry. When the first Columbia River hydroelectric dams were built in the early 1930s, critics claimed they would produce more electricity than the region could ever use. But 20 years later, industry analysts, including the Bonneville Power Administration, were projecting that the region's demand for electricity would double every 10 years, beyond the capacity of the hydropower resource. The solution would be nuclear and "economies of scale" -- the plants of the Washington Public Power Supply System (WPPSS), created by the state Legislature in 1957, and privately funded nuclear or coal-fired plants as well.

Nuclear Power

"Culp was pro-nuclear and believed in economies of scale. It was the conventional wisdom ... and I don't think there was any credible information at the time that was contrary to that" (Krogh). Indeed, it not only was "conventional wisdom," but official state policy. **In 1969, Governor Daniel Jackson Evans (born 1925) announced plans "to make Washington the nation's leader in nuclear energy development**" [...]

By the late 1970s, however, WPPSS was rapidly approaching disaster. Inflation, design changes, contractor boondoggling, and mismanagement by WPPSS

officials and managers had pushed costs far beyond original estimates. Energy shortages driven by the 1973 oil embargo, and a rising tide of environmentalism also were reducing demand and fueling a conservation ethic.

But the industry and state and federal officials were still operating under "a politics of scarcity" (Morgan). The political battle was coalescing in Washington, D.C., where a centralized Pacific Northwest power overseer was being hammered into shape. "The first bill, introduced by Jackson in 1977, was written largely by PNUCC" (Morgan). Actually, that bill was largely the result of a consensus developed by Culp and his associates at Culp Dwyer.

"Culp was really comfortable in that milieu. Culp was just Culp. He was a man of Auburn, the U-Dub [University of Washington]. So sharp, so tuned in, and yet so regular. There was not a phony bone in his body. His roots were so deep, his comfort with himself was so deep, he didn't have to pander to people. Some said he was in the pockets of the private power companies, but that was never true" (Marritz).

George Grader recalled: "Gordy mingled at ease and as an equal with the giants of his day, yet never lost that impish-kid quality, always ready with a shaggy-dog story, told with a conspiratorial grin."

Susanne Tsoming, Culp's secretary at the law firm, also remembered her boss fondly. "He was a great mentor and always a gentleman. Even when I made a mistake, he treated me with kindness ... . He liked puzzles and challenges. He looked at a problem from every angle, upside down, and sideways. Other people would have given up, but he would turn it over in his mind as if looking at a Rubik's Cube for a solution."

Three years from the time that first bill was introduced, the disparate parties and virtually all politicians in the four-state region agreed on the Northwest Power Act of 1980, which created what became known as the Northwest Power and Conservation Council. The addition of *Conservation* to the agency's name summed up the evolution of conventional wisdom in Pacific Northwest power over the ensuing 20 years.

Meanwhile, WPPSS was en route to a $2.25 billion meltdown – the largest default in municipal bond history. The collapse, in 1983, was the result of "bad judgment and bureaucratic bungling on an unprecedented, almost unimaginable scale" (Time). "They came to Culp and our firm, and it was a natural choice," Marritz said. "They wanted someone who was knowledgeable about the business and skilled litigators, and in that firm you found both -- power expertise and terrific litigators."

WPPSS lost, however, when the state Supreme Court decided that the WPPSS participants' contracts -- "take-or-pay" contracts that were standard throughout the industry -- were not valid. "The Supreme Court made a very political decision," Marritz said.

New Challenges

In 1977, in the middle of this regional upheaval in energy, Governor Dixy Lee Ray (1914-1994) named Culp to the University of Washington Board of Regents, a prestigious *pro bono* appointment. Some assumed that his pro-nuclear beliefs influenced the vociferously pro-nuclear Ray, but in fact they had never met. According to Culp, "I got a call out of the blue" (Whitely).

The man whom Culp would later recruit as UW president, William P. Gerberding (1929-2014), said, "I always thought he was an insider with Ray, this odd character who suddenly became governor. [But] Gordon was very surprised." Some of Ray's appointments to the UW Board of Regents may have been fishes-out-of-water, but Culp was "a fish *in* water ... . He was ideally suited for it. He took no easy answer and he was very shrewd."

A year after Culp was appointed, UW President John R. Hogness (b. 1922) announced he was stepping down and in June 1978, Board of Regents President [Mary Maxwell Gates (born 1929)] named Culp to head the search committee to find a successor. Mary Gates, a highly respected philanthropist, was the wife of [William Henry Gates II (born 1925)], another old UW law school classmate of Culp, mother of Microsoft founder [William Henry Gates III (born 1955)], and had known Culp for many years. According to Gerberding, "Gordon and Mary became very close right away. A power center, certainly ... . Gordon and Mary were distinctive. Not only were they great regents, ambitious for the university, but almost irrationally fond of the university. Gordon was a very proud citizen of the Pacific Northwest" (Gerberding).

Recruiting a University President

Relations between Governor Ray and the UW were testy at best and the assignment had a high potential for disaster. But at the time, Culp was described as "the kind of guy who gets things done without being conspicuous about it ... . Culp will have the delicate job of keeping the selection ... free of politics at a time when the Board of Regents is politicized and subject to the possible maneuvering by Gov. Dixy Lee Ray" (Emery).

Governor Ray had taught zoology at the UW from 1945 to 1960. "She had unhappy memories of the university and didn't hide that," Gerberding reflected

Governor Ray had taught zoology at the UW from 1945 to 1960. "She had unhappy memories of the university and didn't hide that," Gerberding reflected. "But she made some very good appointments, with Gordon as exhibit A. Hans Lehmann also was very good. I had a decent relationship with Ray, but she was not a friend of the university, budgetarily or otherwise" (Gerberding).

For Culp, the assignment was something of a crusade. "This is a Gordon-type story," Gerberding said, by way of introduction. "By then, anyone in the university or business world looking for a CEO would hire a headhunter. Gordon said, 'We'll do it ourselves.' He didn't trust their judgment or motives." The committee included Regents **Robert Philip, president and co-founder of the *Tri-City Herald*,** and **R. Mort Frayn (1906-1993), onetime Speaker of the state House of Representatives**. "Both were Republicans, but that was not an issue. There was no partisanship. **One of Mort Frayn's closest friends, in fact, was Maggie [Senator Magnuson]**, back in the days when those things could happen." The committee also included representatives of the university's administration, faculty, students, and alumni association. "It was the usual Noah's Ark committee, which Gordon had to manipulate" (Gerberding).

William P. Gerberding had been on the job as chancellor of the University of Illinois Urbana-Champaign (UI) only a few months when he first met Culp for a couple of hours at Chicago's O'Hare Airport in December 1978. Ostensibly, Culp was picking the chancellor's brain about other candidates. Gerberding didn't consider himself a possibility because of his relatively brief tenure at UI, "but about two months later, Culp called and said, 'What about you?,' " Gerberding recalled.

Gerberding and his wife, Ruth, visited Seattle in March 1979 for interviews, and he accepted the job offer. "I liked the spirit of it, the mood of it. I said Seattle was San Francisco populated by Minnesotans," he recalled.

Gerberding was inaugurated UW's 27th president in January 1980. He became fast friends with Culp, as well as others on the board. With Culp he shared the Navy experience, a major in philosophy, an intense interest in political affairs, and stints as congressional staff. Gerberding had served on the staff of Senator Eugene McCarthy (1916-2005), D-MN.

His honeymoon was short-lived. The state's budget went deep red about seven months after he took office: Departments were cut, hundreds of faculty and staff jobs were lost, and all programs scaled back. "We lost at least 10 percent of our core budget in that process. It was very severe, and not anticipated," Gerberding said.

While Gerberding was busy lobbying the Legislature and Ray (and later Governor John Spellman) for more money, in 1981 Culp "was in the forefront of the UW's campaign to win more autonomy from the Legislature" (Schaefer).

In 1982, Governor John Spellman (1926-2018), a Republican, reappointed Culp to another six-year term. Said Gerberding: "If Gordon was involved in something, people who were serious-minded quickly came to respect him" regardless of party. Culp had a reputation for detail beyond the pale. "We'd be at a board meeting or some other setting, talking through a difficult issue, and think we'd come to a kind of consensus. And about that time, Gordon would want to spin it around one more time, or two more times. He was a philosophy major and a lawyer, a wordsmith. Nothing was obvious to him."

Health Care and Cancer Care

When Culp's two terms on the Board of Regents ended, Gerberding appointed him to the UW Medical Center board, where he would serve until 1998, one term as president. Culp was a founding chairman of the board of the Seattle Cancer Care Alliance. In the summer of 2006 the new board room of the Cancer Care Alliance was dedicated as the Gordon C. Culp Board Room.

Culp was also active in the UW Physicians Network (Neighborhood Clinics) and a member of the Fred Hutchinson/University of Washington Cancer Consortium Strategic Planning Committee.

And he had been a founding board member of the Henry M. Jackson Foundation, established in 1983 to continue the senator's work. Culp "played an influential role in shaping the organization's strategic direction" (*The Jackson Legacy*). In 2004, he was awarded the Henry M. Jackson Award for Distinguished Public Service.

A Husky Fanatic

Culp retired from his law firm in 1990, but continued to answer the public-service call. In 1992, he was appointed chairman of a panel asked to investigate allegations of racism on the part of UW basketball coach Lynn Nance. The panel -- two African American members and two Caucasian -- cleared Nance of the racism allegations, but questioned his coaching style. Nance resigned a year later, after the university agreed to buy out the final year of his contract.

Culp's devotion to Husky football was legendary. He not only attended all home games, but videotaped them -- as well as all away games -- for future viewing. According to Gerberding, **"The two biggest Husky football fanatics that I ever encountered -- and boy, that's a high standard -- were Dan Evans and Gordon Culp" (Shaw)**. And, again proving that he had no problem rowing against the tide of popular opinion, he remained a defender and champion of Rick Neuheisel (b.1961), UW football coach fired in 2003.

In 1993, a year after the Nance investigation, the "taxpayer revolt" had wended its way up from California and Initiatives 601 and 602 were threatening the already beleaguered state budget -- and the state's colleges and universities. Culp was instrumental in forming Citizens for Higher Education, a political action committee to raise money to fight the anti-tax initiatives on the fall ballot, and was its treasurer and spokesman. Supporters included regents and trustees, administrators and faculty members who were alarmed by the damaging effects of tax revolts on higher education in Oregon and California. Culp said: "The University of California system was the pride of this country for generations. It's been decimated. Now the Oregon system is approaching shambles. The same thing would happen here" (Hadley).

End of the Law Firm

Throughout the years of Culp's public service, the law firm, Culp, Dwyer, Guterson & Grader, had continued to prosper. Bill Dwyer had established a reputation as an outstanding antitrust lawyer and civil libertarian, and was appointed a U.S. District Court Judge by President Ronald Reagan (1911-2004). Culp had retired in 1990, and in 1995, the remaining 40-odd members of the Culp Guterson & Grader voted to disband.

Culp was philosophical about the end of the firm he founded. He told a reporter, "Times change. It doesn't do all that much to me ... Bill and I and George Grader and Murray were there 35 years, and we developed it as we wanted. Others can decide how to go forward" (Miletich).

Lawyer Bud Krogh reflected: "Gordy and Bill were the animating spirit of a law firm that was ... and I don't want to overstate it, but in a way it was Camelot when the two of them were there. Not only were they super competent and extraordinarily effective lawyers and litigators, but they had a social conscience. They really felt strongly about making their community better, and contributed enormous amounts of their time to it" (Krogh).

Marriage to Kathie Werner

A year or so after Joan Culp's death, Gordon met Kathie Werner (b. 1947), a Seattle editor (mostly for Microsoft) and writer who'd had a career as a bookseller and publisher's rep. They had many things in common, including Auburn, where Kathie's father had run a variety store and been a fellow Rotary Club member with John Peckenpaugh, one of Culp's oldest friends. Werner, who grew up in Tacoma, was also a formidable debater: She had won several of the same debate tournaments Culp had won 20 years before. She had attended the University of Washington, becoming a Husky fan and ASUW President Thom Gunn's paid speechwriter. She graduated in 1971.

After meeting in 1997, Gordy and Kathie became a couple and they married in 2002. They were enthusiastic travelers, going to Vietnam and Singapore, taking the Silk Road tour of China, and traveling also to Italy and Germany. Kathie Werner says, "Gordy reminded me of a line from a Theodore Roethke poem: 'The right thing happens to the happy man.'"

A Passion for Discourse

Culp was "mouthy," loved discourse, repartee, argument, didn't suffer fools gladly, and didn't trust the media. " 'If they ever call ... say nothing,' " his former secretary Susanne Tsoming said, recalling his instructions. "'You have to be very careful when you talk to them. They're only human and they may have a bias.' I was very young then. I thought what they said was the truth."

Culp made no secret of his political passions, or any others, as long as he could draw a breath and put pen to paper. In a letter in the *Seattle Post-Intelligencer*, March 30, 2003, only 10 days after the Iraq War began, Culp rejected the conventional wisdom of the time that finding weapons of mass destruction would have justified the invasion in the eyes of the world. He was prescient.

"Not so," he wrote:

> "Even if we discover such supplies, our choice of war and the death of innocent people have forever precluded the world from knowing whether the ongoing, universally supported disarmament procedure would have worked.
>
> "Many friends of the United States (as well as all who already dislike, fear and distrust us) will not soon exonerate us from destroying the possibility of a peaceful solution. That cannot bode well for our future safety and comfort, not to mention our self-respect."

Last Years

Gordon Culp was diagnosed with cancer in 2003, and the disease became terminal in 2006. The end in sight, he held court for friends and family, with "courage and characteristic forthrightness," said an encomium signed by University of Washington leaders past and present -- Bill Gates Jr., Gerberding, Philip, and Grinstein among them. Grader recalled a final visit with Culp, along with Murray Guterson, Lou Nawrot, and another law firm partner, Jerry McNaul: "As we trooped up the stairs, having said our goodbyes, he called out and waved and yelled, as best he could, 'It's been a great ride, hasn't it boys?'"

Gordon Culp died on April 23, 2006. His memorial service was held at the University of Washington's Kane Hall, and was filled with representatives of Washington state's power structure, from former governors Evans and Mike Lowry on down. Jackson Foundation Executive Director Lara Iglitzin, in her remarks at the service, recalled: "Gordy gave Kathie strict orders about the reception: 'I want *very good* food,' he said, and '*fairly good*' wine."

I joined the Institute of Zoology in 1988 as Veterinary Pathologist for the Zoological Society of London; a job which involved carrying out diagnostic pathology on zoo and wild animal species. Since 2001 I have led a team of researchers at the Institute of Zoology who work on wildlife diseases, with particular reference to biodiversity conservation, on a wide range of animal taxa: from snails to whales.

Research Interests

My main area of interest is the study of disease threats to wildlife conservation, although I am also interested in host-parasite interactions and co-evolution, and in wildlife disease and comparative pathology per se. One of my main projects is the investigation of catastrophic vulture declines in India with colleagues at the Royal Society for the Protection of Birds , the Bombay Natural History Society , the Venkateshwara Hatcheries Poultry Diagnostic and Research Centre and the National Bird of Prey Centre. Much of this work has been funded by the RSPB and we recently won a grant from the Darwin Initiative for the Survival of Species to further our studies on this major ecological and socio-economic problem.

A Report of Intestinal Sarcocystosis in the Bullsnake (*Pituophis melanoleucus sayi*) and a Re-evaluation of *Sarcocystis* sp. from Snakes of the Genus *Pituophis*

Peter Daszak[1] and Andrew Cunningham,[2] [1] School of Life Sciences, Kingston University, Kingston-u-Thames, Surrey KT1 2EE, United Kingdom and [2] Veterinary Science Group, Institute of Zoology, Regent's Park, London NW1 4RY, United Kingdom

ABSTRACT: We report a severe enteric infection of *Sarcocystis* sp. from a wild-caught bullsnake (*Pituophis melanoleucus sayi*). The animal was collected in October 1988 by a commercial dealer, imported into the United Kingdom during November 1988 and purchased by the London Zoo, in December 1988. The animal was not fed after capture and was anorexic from the time of purchase to the time of death in January 1989. On necropsy, the animal was emaciated and the mucosa of the proximal intestine was markedly thickened. The lamina propria was packed with oocysts, and enterocytes were parasitized by an organism which closely resembled *Sarcocystis roudabushi* and *Sarcocystis idahoensis*, two bisporocystid coccidia described previously from *Pituophis melanoleucus*. We propose that *Sarcocystis idahoensis* and *Sarcocystis roudabushi* are synonymous since both occur in the same host species, both invade the intestinal lamina propria and enterocytes, and sporocyst measurement ranges of both species overlap. This is the first report of death believed to be due to sarcocystosis in a naturally-infected definitive host.

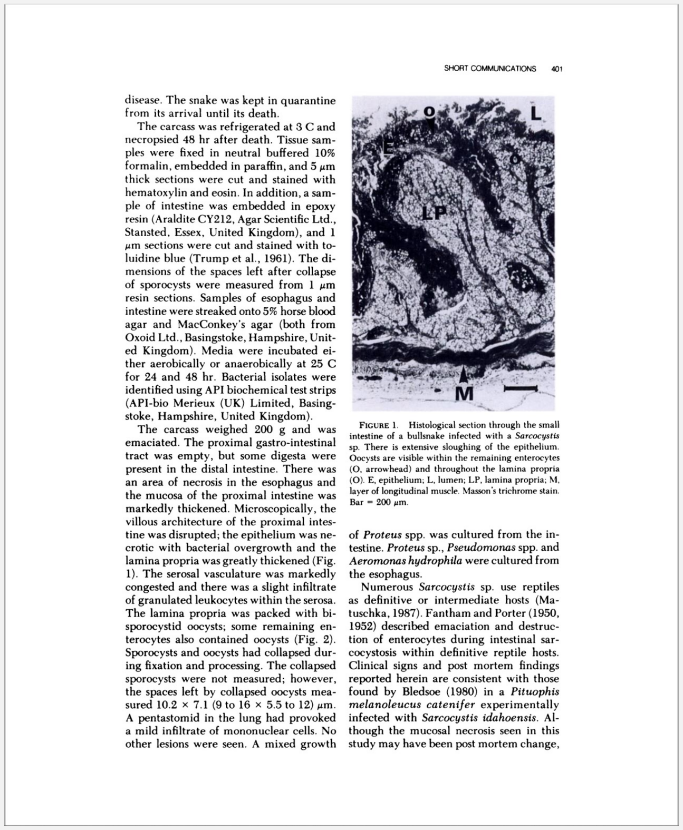
Key words: *Pituophis melanoleucus*, *Sarcocystis*, *Isospora*, sarcocystosis, pathology, taxonomy.

Sarcocystosis is an important disease of livestock caused by the asexual developmental stages of *Sarcocystis* spp. within non-intestinal tissues of the intermediate host (Dubey et al., 1989). In the definitive host, the parasite reproduces sexually within the intestinal mucosa. Reports of intestinal sarcocystosis causing clinical signs are rare, but occasionally symptoms of vomiting, diarrhea and anorexia have been reported in humans (Bunyaratvej et al., 1982). Here we report disease associated with an enteric infection of a *Sarcocystis* sp. in a wild-caught bullsnake (*Pituophis melanoleucus sayi*).

Identification of intestinal *Sarcocystis* spp. is complicated by the similarity of their oocysts and sporocysts to those of *Isospora* spp. and *Toxoplasma* spp. However *Sarcocystis* spp. undergo merogony in the intermediate host only (Dubey et al., 1989). The presence of fully sporulated oocysts within the host (endogenous sporulation) is another distinguishing characteristic (Upton et al., 1992). Only three coccidia with *Sarcocystis* sp. or *Isospora* sp. types of oocysts have been described in snakes of the genus *Pituophis*: *Sarcocystis roudabushi* Levine and Tadros, 1980, (Roudabush, 1937; Pellerdy, 1974) *S. idahoensis* Bledsoe, 1980 and an unnamed *Sarcocystis* sp. Upton et al. 1992 (Wacha and Christiansen, 1975). All are found in subspecies of *Pituophis melanoleucus*. In this paper we describe lesions associated with a *Sarcocystis* sp. in a wild-caught bullsnake, and propose that *S. roudabushi* and *S. idahoensis* are synonymous using the criteria by which they were originally described.

An adult male bullsnake (*Pituophis melanoleucus sayi*) was captured in northern Illinois within the area 39° to 42°N, 88° to 90°W, by a Tennessee dealer in October 1988. The snake was exported to the United Kingdom within 2 wk of capture, collected immediately upon arrival by a British dealer, who then sold the snake to London Zoo in mid-December 1988. Based on all available information, we believe that the snake was not fed in the USA between capture and export. The snake was not fed during or after import into the United Kingdom on 13 December 1988; indeed the snake refused to eat following purchase by the zoo until its death on 18 January 1989. The animal had no other signs of

Page 400 : [HP004Y][GDrive]



disease. The snake was kept in quarantine from its arrival until its death.

The carcass was refrigerated at 3 C and necropsied 48 hr after death. Tissue samples were fixed in neutral buffered 10% formalin, embedded in paraffin, and 5 μm thick sections were cut and stained with hematoxylin and eosin. In addition, a sample of intestine was embedded in epoxy resin (Araldite CY212, Agar Scientific Ltd., Stansted, Essex, United Kingdom), and 1 μm sections were cut and stained with toluidine blue (Trump et al., 1961). The dimensions of the spaces left after collapse of sporocysts were measured from 1 μm resin sections. Samples of esophagus and intestine were streaked onto 5% horse blood agar and MacConkey's agar (both from Oxoid Ltd., Basingstoke, Hampshire, United Kingdom). Media were incubated either aerobically or anaerobically at 25 C for 24 and 48 hr. Bacterial isolates were identified using API biochemical test strips (API-bio Merieux (UK) Limited, Basingstoke, Hampshire, United Kingdom).

The carcass weighed 200 g and was emaciated. The proximal gastro-intestinal tract was empty, but some digesta were present in the distal intestine. There was an area of necrosis in the esophagus and the mucosa of the proximal intestine was markedly thickened. Microscopically, the villous architecture of the proximal intestine was disrupted; the epithelium was necrotic with bacterial overgrowth and the lamina propria was greatly thickened (Fig. 1). The serosal vasculature was markedly congested and there was a slight infiltrate of granulated leukocytes within the serosa. The lamina propria was packed with bisporocystid oocysts; some remaining enterocytes also contained oocysts (Fig. 2). Sporocysts and oocysts had collapsed during fixation and processing. The collapsed sporocysts were not measured; however, the spaces left by collapsed oocysts measured 10.2 × 7.1 (9 to 16 × 5.5 to 12) μm. A pentastomid in the lung had provoked a mild infiltrate of mononuclear cells. No other lesions were seen. A mixed growth

FIGURE 1. Histological section through the small intestine of a bullsnake infected with a *Sarcocystis* sp. There is extensive sloughing of the epithelium. Oocysts are visible within the remaining enterocytes (O, arrowhead) and throughout the lamina propria (O). E, epithelium; L, lumen; LP, lamina propria; M, layer of longitudinal muscle. Masson's trichrome stain. Bar = 200 μm.

of *Proteus* spp. was cultured from the intestine. *Proteus* sp., *Pseudomonas* spp. and *Aeromonas hydrophila* were cultured from the esophagus.

Numerous *Sarcocystis* sp. use reptiles as definitive or intermediate hosts (Matuschka, 1987). Fantham and Porter (1950, 1952) described emaciation and destruction of enterocytes during intestinal sarcocystosis within definitive reptile hosts. Clinical signs and post mortem findings reported herein are consistent with those found by Bledsoe (1980) in a *Pituophis melanoleucus catenifer* experimentally infected with *Sarcocystis idahoensis*. Although the mucosal necrosis seen in this study may have been post mortem change,

Virus linked to dying frogs

By LEIGH DAYTON
Science Writer

A plague that has killed tens of thousands of frogs in Britain has provided the first hard evidence that a deadly virus is implicated in the mysterious decline of the world's frog population.

The virus was discovered in British frogs by Dr Andrew Cunningham, a veterinary pathologist at the Institute of Zoology in London. In February he brought samples of the virus to the Australian Animal Health Laboratory (AAHL) in Geelong where virologist Dr Alex Hyatt and his colleagues have now identified it as an iridovirus.

Dr Hyatt said iridoviruses were known to cause diseases in some fish and insects, and one type of iridovirus, Bohle, is known to infect a Queensland burrowing frog.

"It is very tempting, very exciting, but [the link to disappearing frogs] is still unproven," a frog expert, Associate Professor Mike Tyler, of the University of Adelaide, cautioned yesterday.

According to Dr Cunningham, huge numbers of frog deaths were first reported in southern England in 1985. Since then between 7,000 and 8,000 deaths have been reported annually by the public.

"That's an underestimate of the actual number dying per year", he told the *Herald* last week before returning to London.

Dr Cunningham is now conducting "transmission trials" to confirm the virus is definitely the British culprit. "It is the likeliest candidate," he said, having ruled out toxins, pollution, parasites, bacteria "and so on" as causes of the British epidemic.

Meanwhile, the AAHL scientists have joined with Dr Rick Speare, a virologist at James Cook University in Townsville, biologist Dr Keith McDonald, of the Queensland Department of Environment and Heritage, and Professor Tyler to look for evidence of the British virus in Australian frogs.

If findings are positive, the international collaborators will have strong evidence that the virus is the final blow, killing animals already weakened by destruction of their habitat.

Scientists blame foreign killer for frog massacre in South-east

Alison Daniels

A VIRUS from overseas may be to blame for the lingering death of hundreds of thousands of frogs in South-east England, scientists revealed yesterday after a five-year study

The Institute of Zoology at London University and the Suffolk-based organisation, Frogline, investigated the reasons behind a noticeable increase in the number of frogs found dead at some 2,000 locations from Dorset to East Anglia.

The scientists, who have studied environmental factors as well as disease, believe that the most likely killer is an iridovirus.

It causes the common frog to develop a red rash, open sores, internal bleeding, skeletal and muscular wasting and loss of toes.

It is feared the virus could spread to the rest of Britain's 16 million frog population after isolated cases were discovered in Scotland and Wales.

The Frog Mortality Study, which is part-funded by the RSPCA and conducted by Frogline's Tom Langton and the Institute of Zoology's Andrew Cunningham and Peter Bennett, found that most of the frogs affected live in garden ponds.

Mr Langton said that in some areas the frog population had crashed to dangerously low levels. It was not yet clear if the numbers would recover.

Frog numbers have been affected by disease or pollution, but only in very localised incidents, said Mr Langton.

Research now had to be carried out into whether the virus was new, the consequence of some human activity or whether it had been imported and was similar to that found in other animals, such as the American bullfrog.

Scientists hoped to carry out a wide-scale study, and to research ways the virus may have been transmitted through the plant and fish trade.

A spokesman for English Nature said the organisation would be interested in the findings.

However he said that the biggest threat to frogs remained the destruction of their habitat.

Disease killing frogs is linked to goldfish from US

Frogs are prey to many things
Photograph: Graham Turner

Paul Brown
Environment correspondent

A disease epidemic is killing millions of Britain's most common and least studied amphibian, the frog — and the cause could be goldfish imported from the US.

Soon frogs should be engaged in the annual breeding frenzy which leads to the piles of frogspawn in garden ponds — to the delight of children and of gardeners, who rely on frogs to keep down the slug population.

But large areas of London and the south-east have seen a wiping out of the frog population on a scale reminiscent of myxomatosis in rabbits. The disease causes sores and sometimes the loss of whole legs as the frogs die slowly.

So far there have been 3,500 documented cases of the disease, with a body count of 62,000, the worst outbreak killing 2,000 frogs in a single incident.

Tom Langton, director of the Froglife Trust, who has been studying the spread of the disease, said it was killing populations south of a line between Dorset and Norfolk, but cases had been found in the Midlands, Wales and Scotland.

The disease was first noted in the early 90s but spread rapidly and began to threaten whole populations. He said: "They may be wild animals but people get attached to them and they are almost in tears when they ring to ask what to do. The frogs look so desperate with sores and toes falling off as they get weaker and weaker."

Mr Langton, with Andrew Cunningham and Peter Bennett of the Institute of Zoology at Regents Park, the research arm of London Zoo, has been looking for a cause of the epidemic.

A virus known to able to jump species has been identified as the cause. A ranavirus found in north America is the main culprit. This appears to have arrived in Britain from goldfish farmed in the US and brought to Britain to put in garden ponds. Goldfish and frogs both dying from ranavirus have been found sharing the same ponds.

The virus also affects the north American bullfrog, brought to this country as tadpoles to be sold in pet shops in the 80s. Another theory is that Americans with shotguns, shooting bullfrogs in fish farms, blasted the pieces into the ponds, which were eaten by the fish, which were subsequently imported to Britain bringing the infection with them.

Since the virus also attacks other reptiles, and a pet London tortoise has died of it, there are fears that other British species may also suffer population crashes.

A complicating factor in the study is the presence of large quantities of copper in the livers of frogs, which would damage their immune system and make them more susceptible to disease. Many of the dead frogs were recorded as having higher concentrations of copper than previously known to science.

The main culprit for this is slug pellets, which include copper to give them their characteristic blue colour designed to make them unattractive to birds. Frogs feasting on half dead slugs, some with slug pellets attached, could be destroying their own immune systems allowing them to fall victim to the virus.

Mr Langton said: "We have a fantastic amount of information on this disease and not the financial means to continue studying it. Foot and mouth cost £3bn and BSE even more, what we need is £1m to study the common frog and find out what is wiping it out."

A variety of colours and dangers

- The frog is Britain's most common amphibian, although no one has ever counted them
- Frogs hop up to 2ft, have webbed feet, and wet looking skin, unlike toads which mostly crawl, have claws and are warty
- They can be green, red, brown, grey or yellow
- Frogs grow all their lives, reaching 10cm (4in) in six or seven years, but most do not last that long, being eaten by herons, foxes, hedgehogs, domestic cats or grass snakes, or run over
- Frogs breed in still water, mostly in garden ponds. The young emerge in wet weather in mid-summer and return to breed two or three years later
- Most frogs are still hibernating, burying themselves in damp ground or in mud at the bottom of ponds
- Food includes slugs, worms and flies and many insects

Hurricanes spread plant diseases and ruin crops

The term "emerging infectious diseases" (EIDs) typically makes people think of HIV/AIDS, Ebola, or SARS. However, in a paper released today in the leading ecology journal *Trends in Ecology and Evolution*, an international team of researchers led by Wildlife Trust's Consortium for Conservation Medicine has highlighted a series of emerging plant diseases that are devastating crops globally, and impacting humans through agricultural and economic loss.

Nikkita Patel, Program Officer for the Consortium for Conservation Medicine, and lead researcher for the group, comments, "The recent spate of extreme weather events in Florida and elsewhere highlights the need to protect crops and wild plants from invasive pathogens that exploit the damaged environments following hurricanes." She notes that the reason these diseases are emerging is because we are changing the environment at such a rapid rate. Ms. Patel adds, "These highly evolved diseases are being given the chance of spreading into new regions, wiping out crops and wild plants as they go. Unless we radically change our approach and provide proper surveillance and control, these diseases have the potential to undermine the basis for our food security in the future."

The research team analyzed broad trends in emerging plant diseases and showed that:

·Extreme weather events, such as the hurricanes that hit Florida, are one of the leading causes of plant EIDs. This is due to the sensitivity of plants to fluctuations in moisture levels and the responses of plant pathogens to weather events. With projections that climate change will increase extreme weather events, disease-related die-offs will likely increase with time.

A series of key wild plant species are at risk of extinction due to emerging diseases. For example, the endangered cedar tree (*Torreya taxifolia*) is only found over a 154 square mile area of the Florida panhandle and is gradually being wiped out by a fungal disease and extreme weather events. This unique tree species once had a population of over 500,000, but is now reduced to only 1,500.

The underlying cause of most plant EIDs is the anthropogenic introduction of pathogens, or "pathogen pollution." This is related to changes in land use, global warming, and trade in plants and plant products.

Technological advances in agriculture are leaving global crops open to disease emergence. For example, in many developing countries the availability of year-round irrigation and declining market prices for staple crops has promoted increased intensity and acreage of non-traditional crop plants, thus promoting disease emergence.

The international trade in seeds is an estimated US $40-80 billion-per-year industry. Over 2,400 microorganisms are known to occur in seeds of 383 genera of plants. It is estimated that up to one-third of plant viruses are seed-borne. Improved surveillance and control of disease in this trade is urgently needed.

According to Peter Daszak, Executive Director of Wildlife Trust's Consortium for Conservation Medicine, "Not only are plant EIDs wiping out crops, they're threatening the biodiversity of plant life on our planet. With diseases like sudden oak death (*Phytophthora ramorum*) marching through our forests, we have an unprecedented risk for loss of ecosystems."

The team's results are part of a new approach to emerging diseases that stresses the need for predicting when and how diseases will emerge and dealing with them before they cause significant outbreaks. "If we can predict where diseases will occur, we'll be better equipped to handle them once they emerge," observed Mary Pearl, President of Wildlife Trust.

Pamela K. Anderson, Andrew A. Cunningham, Nikkita G. Patel, Francisco J. Morales, Paul R. Epstein and Peter Daszak. 2004. Emerging infectious diseases of plants: pathogen pollution, climate change and agrotechnology drivers. *Trends in Ecology & Evolution*

About The Consortium for Conservation Medicine

The Consortium for Conservation Medicine (CCM) is a unique collaborative institution that strives to understand the link between anthropogenic environmental change, health of all species, including humans, and the conservation of biodiversity.

About Wildlife Trust

Wildlife Trust is an international organization dedicated to innovative conservation science and conservation medicine, linking ecology and human health in the New York region and around the world. Wildlife Trust trains and supports a network of local scientists in over twenty countries in their efforts to save endangered species and their habitats and to protect the health of ecosystems that are vital to life on Earth.

Change in the pecking order

The vulture population in India is in rapid decline, leaving human and animal remains either to rot, or feed increasing numbers of rabid dogs, writes **Sanjida O'Connell**

'We passed thence to a scene of a different sort: from this glow of colour to those grim receptacles of the Parsee dead, the Towers of Silence ... we have no name that is so majestic as that one, or lingers upon the ear with such deep and haunting pathos." So wrote Mark Twain in Following the Equator.

The Parsees cannot cremate, bury or submerge their dead in water because they consider a corpse impure and their Zoroastrian faith does not permit them to defile any of the elements — air, earth, water or fire.

This desert ritual, which originated with their faith in Persia more than 3,000 years ago, dictates that the dead be left to vultures in stone citadels called Towers of Silence. The pathos now haunting these stone towers is a lack of vultures. India's vulture population has crashed, putting the Parsees in a difficult position, but also endangering India's fragile ecosystems, and her people.

The problem was noticed by Dr Vibhu Prakash, the Bombay natural history society's principal scientist, whose survey at Keolodeo National Park, Rajasthan, showed a decline of 96% in two species of vulture — the Indian white-backed, and the long-billed, vulture. A nationwide survey in 2000 confirmed his results. In one region, for example, the numbers of white-backed vultures had fallen from 21,000 to 2,000 within seven to 10 years.

White-backed vultures feed on dead buffalo
JOANNA VAN GRUISEN/ARDEA LONDON

"Most people think vultures evolved to steal bits off lion kills but, in fact, vultures take almost no meat from predators. They evolved to find carcasses — animals that died of old age, illness or malnutrition," says David Houston, a professor of zoology at the institute of biomedical and life sciences, Glasgow University.

Indian vultures grew to depend on dead livestock. Diminished numbers mean cattle are left to rot in the heat. The implications are serious. Feral dogs have increased rapidly in the absence of competition. Many carry rabies and already half of the world's rabies cases are found in India. Second, since dogs are predators as well as scavengers, they are likely to hunt ground-nesting birds and small mammals.

"We don't know what the long-term implications for India's wildlife could be," says Houston. Contamination from the carcasses could seep into the ground water, leading to widespread epidemics, including anthrax, which can be carried by cattle.

The problem may also go global: eurasian vultures have been migrating in increasing numbers to India, and the birds could spread anthrax and other diseases to the Middle East, Europe and Africa. Whatever has caused the decline of the vultures in India might be transmitted to the rest of the word's vultures.

Funded by a newly awarded Darwin Initiative, Dr Debbie Pain, head of international research at the RSPB, and Dr Andrew Cunningham, from the Institute of Zoology, London, have begun investigating what is causing the decline. In spite of the Parsees — of whom only 76,000 remain — vultures are frequently shot. Pesticides and herbicides, used liberally in India, also kill them.

However, Pain and Cunningham believe the birds have not been poisoned: numbers are as low in nature reserves as they are in unprotected areas, and post-mortems have not revealed traces of toxic chemicals. Instead, the researchers discovered that the vultures were suffering from severe renal and visceral gout, often associated with kidney failure, which will kill the birds within hours, as well as inflammation of the blood vessels and the brain.

It's precious little to go on, but a virus could be the culprit. "We are keeping our minds as open as possible," says Pain. "Although our findings indicate viral involvement, this may not be the case or may only be part of the story."

As Twain wrote: "The ring of vultures rose, flapping their wings, and swooped down into the Tower to devour the body. Nothing was left of it but a clean-picked skeleton when they flocked-out again a few minutes afterward."

This is hardly the case now. Approximately six vultures remain, instead of the 120 needed to cope with three corpses a day. The Parsees have installed eight giant solar reflectors in one of the 350-year-old towers to hasten decomposition. They have also enlisted the help of Jemima Perry-Jones, of the national birds of prey centre, near Gloucester, who is the only non-Parsee to have entered a Tower of Silence, she has now established a vulture-breeding programme.

2020 (March 29) - BBC - "Coronavirus: Pangolins found to carry related strains"

By Helen Briggs / BBC News / Published 26 March 2020

https://www.bbc.com/news/science-environment-51496830

2020-03-29-bbc-com-coronavirus-pangolins-found-to-carry-related-strains

Smuggled pangolins have been found to carry viruses closely related to the one sweeping the world.

Scientists say the sale of the animals in wildlife markets should be strictly prohibited to minimise the risk of future outbreaks.

Pangolins are the most-commonly illegally trafficked mammal, used both as food and in traditional medicine.

In research published in the journal Nature, researchers say handling these animals requires "caution".

And they say further surveillance of wild pangolins is needed to understand their role in the risk of future transmission to humans.

Two groups of coronaviruses related to the virus behind the human pandemic have been identified in Malayan pangolins smuggled into China, said lead researcher Dr Tommy Lam of The University of Hong Kong.

"Although their role as the intermediate host of the SARS-CoV-2 outbreak remains to be confirmed, sale of these wild animals in wet markets should be strictly prohibited to avoid future zoonotic [animal to human] transmission," he told BBC News.

Bats also contain coronaviruses, which are closer still to the human virus, except in one key area - the part that helps the virus invade cells.

"This tells us that viruses that look pretty adapted to humans are present in wildlife," said co-researcher, Prof Edward Holmes of the University of Sydney. "Bats are certainly involved, pangolins may be, but it is very possible that other animal species are involved as well."

Exactly how the virus jumped from a wild animal, presumably a bat, to another animal and then humans remains a mystery. The horseshoe bat and the pangolin have both been implicated, but the precise sequence of events is unknown.

Finding the virus in smuggled Malayan pangolins raised the question of where they contracted the virus, said Dr Lam. Was it from bats along the trafficking route to China or in their native habitats in Southeast Asia?

Calls to end illegal wildlife trade

Conservationists say it would be devastating if the discovery led to further persecution of the endangered mammal. The animal's scales are in high demand for use in traditional Chinese medicine, while pangolin meat is considered a delicacy.

"This is the time for the international community to pressure their governments to end illegal wildlife trade," said Elisa Panjang of Cardiff University, a pangolin conservation officer at the **Danau Girang Field Centre in Malaysia**.

China has moved to ban the consumption of meat from wild animals in the wake of the outbreak. Similar moves are being considered in Vietnam.

Prof Andrew Cunningham of Zoological Society of London (ZSL) said it was important not to jump to conclusions from the paper. "The source of the detected coronavirus really is unknown - it might have been a natural pangolin virus or have jumped from another species between capture and death."

And Dr Dan Challender, of the University of Oxford, said pangolins are known to host various strains of coronaviruses. "Identifying the source of SARS-CoV-2 is important to understand the emergence of the current pandemic, and in preventing similar events in the future," he said.

Norman Dahl; helped India go high-tech

By Gloria Negri, Globe Staff, 1/23/2004

When India's prime minister Jawaharlal Nehru asked the Massachusetts Institute of Technology for help in starting an institute of technology in 1961, MIT promptly turned to Dr. Norman C. Dahl.

A professor of mechanical engineering at MIT, Dr. Dahl had not only the intellectual skills required, but the human skills as well.

Dr. Dahl, who helped bring computer technology to Kanpur, India, died of Alzheimer's disease on Jan. 11 at Fairlawn Nursing Home in Lexington. The 85-year-old was a resident of Cambridge and Block Island, R.I. The success of the Indian Institute of Technology at Kanpur, with graduates now spanning the world as professors, engineers, computer scientists, and entrepreneurs, remains a tribute, friends said, to Dr. Dahl's diligence and ability to connect with people.

"Norman was a powerful servant of American international policy and practical effort and, in short, a serving citizen of not one but several countries in his time," said Harvard economist John Kenneth Galbraith, the US ambassador to India when Dr. Dahl was there from 1962 to 1964. "Perhaps the most spectacular achievement of the early days of the IIT/Kanpur was its contribution to the computer revolution of India -- now a commonplace," Galbraith said. "Not often, and perhaps not ever, has an economic and technical effort so rewarded both the donor country and the major recipient."

Dr. Dahl's wife, Dorothy (Sweet), said the gift by IBM to IIT/Kanpur in 1963 of a computer was "perhaps the first computer in a teaching institution in the subcontinent."

Four other technology institutes, established by India, Germany, Russia, and Britain, still flourish in India. But according to MIT professor Arvind Mithal, a graduate of IIT/Kanpur, "The American model dominates them all, and Norman was, perhaps, the most important to it."

While other engineering schools existed before the IITs, Mithal said, "the IITs revolutionized engineering education in India. The American model was different from the existing schools because it was not like [learning] a trade but was deeply embedded in science.

"Norman was a brilliant administrator and utterly charming," Mithal said. "He connected with people. His attitude was, `Let's see what works.' "

Under Dr. Dahl's setup, the IIT was run by Indians, instead of Americans.

Rama Dasari, associate director of an MIT laboratory, agreed. "Norman's particular talent was in delegating," he said. "He allowed the best to come out of the Indian administrators while the American professors stayed in the background."

Dr. Dahl, his wife, and their two young children stayed in Kanpur for two years. While there, his wife helped start a school for children of institute workers. **The family would return to India in 1968 for three years, when Dr. Dahl was appointed the Ford Foundation's deputy representative on projects dealing with over-population, education, agriculture, and urban planning.**

Dr. Dahl was born in Seattle, one of three sons of a Norwegian-born father who once panned for gold in Alaska and a Norwegian-American mother. In his senior year at the University of Washington, Dr. Dahl was the first engineering student and non-fraternity member to be elected president of the student body. He graduated with a degree in civil engineering.

At the start of World War II, Dr. Dahl was at Princeton University with the Passive Protection Against Bombing, a committee of the Office of Scientific Research and Development.

The Dahls were married in 1943, and Mrs. Dahl, also, took a position at Princeton. Later, Dr. Dahl became the only civilian assigned to the staff of General Curtis LeMay, head of the US Air Force Strategic Air Command on Guam, where air attacks on Japan were launched. "Norman was provided with a document giving him the rank of major in the event of his capture," his wife said.

In 1946, the Dahls moved to the Boston area when Dr. Dahl came to do graduate study at MIT. **He earned his doctorate of science in mechanical engineering in 1952 and stayed on at MIT to teach.** He was appointed professor in the department of mechanical engineering in 1959.

That same year, Dr. Dahl co-edited, with MIT professor Stephen Crandall, the textbook "An Introduction to the Mechanics of Solids," with chapters written by seven MIT professors. The text is still in use today around the world.

The book was five years in the making, said Crandall, now retired. "You can imagine that there might have been disagreement among the authors and it was because of the humanity and good grace of Norman Dahl that he was able to pour oil on rough waters. It was so typical of Norman's approach to a problem to get everyone involved."

Dr. Dahl left MIT in 1968 and worked as a consultant in mechanical engineering on projects that took the Dahls around the world. "If Norman had to make a choice," his wife said, "it was always the adventurous one."

In 1969, the Dahls bought a home on Block Island, where Dr. Dahl not only led a study of the island's water supply and its effect on the island's development but served as a member of its sewer commission. **He was also involved in a study of Lyme disease on the island.** Besides his wife, Dr. Dahl leaves a son, Christian, of King Ferry, N.Y.; a daughter, Sabra, of Cambridge; and three grandchildren.

A memorial gathering will take place at 5 p.m. Feb. 28 at the MIT Faculty Club. The family plans to bury his ashes in July on Block Island.

Peter Daszak is a British zoologist and an expert on disease ecology, in particular on zoonosis. He is currently president of EcoHealth Alliance, a nonprofit non-governmental organization that supports various programs on global health with headquarters in New York City. He is a researcher, consultant and public expert for media inquiries on the subject of virus-caused epidemics. In late April 2020, during the COVID-19 pandemic, the National Institutes of Health (NIH) "abruptly terminated" EcoHealth Alliance's research funding.[1][2]

Education

Daszak earned a B.Sc. in Zoology in 1987 at University College of North Wales (UCNW), and a Ph.D. in parasitic infectious diseases in 1994 at University of

Daszak earned a B.Sc. in Zoology in 1987 at University College of North Wales (UCNW), and a Ph.D. in parasitic infectious diseases in 1994 at University of East London. [3]

Career

Daszak worked at the School of Life Sciences, Kingston University, in Surrey, England in the 1990s. In the late 1990s Daszak moved to the United States and was affiliated with the Institute of Ecology at the University of Georgia and the National Center for Infectious Diseases, Centers for Disease Control and Prevention, in Atlanta, Georgia. Later he became executive director at a collaborative think-tank in New York City, the Consortium for Conservation Medicine. He holds adjunct positions at several universities in the U.S. and the U.K., including the Columbia University Mailman School of Public Health. [3]

He was one of the early adopters of conservation medicine. [4] The Society for Conservation Biology symposium in 2000, had focused on the "complex problem of emerging diseases".[4] He said in 2001 that there were "almost no examples of emerging wildlife diseases not driven by human environmental change...[a]nd few human emerging diseases don't include some domestic animal or wildlife component." His research has focused on investigating and predicting the impacts of new diseases on wildlife, livestock, and human populations, and he has been involved in research studies on epidemics such as the Nipah virus infection, the Hendra virus, SARS-1, Avian influenza, and the West Nile virus. [5]

Daszak has served on committees of the International Union for the Conservation of Nature, World Health Organization (WHO), National Academy of Sciences, and United States Department of the Interior. [3] He is a member of the National Academy of Medicine and Chair of the National Academies of Sciences, Engineering, and Medicine (NASEM)'s Forum on Microbial Threats and sits on the supervisory board of the One Health Commission Council of Advisors.[6]

Daszak is the president of the New York-headquartered NGO, EcoHealth Alliance,[7] known for its research on global emergent diseases such as Severe Acute Respiratory Syndrome (SARS), Nipah virus, Middle East Respiratory Syndrome (MERS), Rift Valley fever, Ebola virus, and COVID-19.

Publications

As of 2020 he has authored or contributed to over 300 scientific papers and been designated a Highly Cited Researcher by the Web of Science. In addition to citations in academic publications, his work has been covered in leading English-language newspapers,[8][9] television and radio broadcasts, documentary films[10] and podcasts.

Media coverage

During times of large virus outbreaks he has been invited to speak as an expert on epidemics involving diseases moving from animals to humans.[6][11][12] At the time of the Ebola outbreak in West Africa in 2014, Daszak said"Our research shows that new approaches to reducing emerging pandemic threats at the source would be more cost-effective than trying to mobilize a global response after a disease has emerged".[13]

In October 2019, when the federal government "quietly" ended the ten-year old program called Predict, operated by United States Agency for International Development (USAID)'s emerging threats division,[14] experts like Daszak, expressed concern that shutting Predict down, could "leave the world more vulnerable to lethal pathogens like Ebola and MERS that emerge from unexpected places, such as bat-filled trees, gorilla carcasses and camel barns."[14] Daszak said that compared to the $5 billion the US spent fighting Ebola in West Africa, Predict—which cost $250 million—was much less expensive. As well, Daszak said, "Predict was an approach to heading off pandemics, instead of sitting there waiting for them to emerge, and then mobilizing."[14]

COVID-19 Pandemic

On February 9, 2020, Newt Gingrich invited Daszak as a special guest along with Anthony Fauci on Newt's World to discuss the coronavirus.[15]

In his February 27, 2020 New York Times article, entitled "We knew Disease X was Coming", Daszak said R&D Blueprint group of experts to which he belonged, had warned the World Health Organization in February 2018 in Geneva, Switzerland, of the "next pandemic, which would be caused by an unknown, novel pathogen that hadn't yet entered the human population". The Blueprint group coined this hypothetical pathogen "Disease X" and was included it on a list of eight diseases which they recommended should be given highest priority in regard to research and development efforts, such as finding better diagnostic methods and developing vaccines.[16] He said, "As the world stands today on the edge of the pandemic precipice, it's worth taking a moment to consider whether Covid-19 is the disease our group was warning about."[8]

On March 20, 2020 Daszak was featured in a PBS Newshour special podcast "Understanding the coronavirus".[17]

In April and May 2020, during the COVID-19 pandemic, Daszak was interviewed by National Public Radio (NPR),[18] CNN, [19] NBC News,[20] CBS News, [1] and other outlets, refuting the idea that COVID-19 pandemic was caused by a virus resulting from a laboratory accident at the Wuhan Institute of Virology.

In his April 26 interview with CNN's Fareed Zakaria, Daszak said that conspiracy theories had emerged "pointing the finger at China". He said that "politicization" had resulted in "countries" cramp[ing] up" which was unfortunate because "what we need right now is open communication with scientists across the world. China has done a lot to deal with this virus before us. They know a lot about how to control it. We need access to that information and talking in political terms about this outbreak closes down the access."[19]

According to a May 9, 2020 news report by a number of media outlets, National Institutes of Health (NIH) "abruptly terminated" EcoHealth Alliance's "research grant, which was "focused on identifying and warning about coronaviruses dangerous to human health."[1][2]

Daszak was part a segment of the May 11, 2020 broadcast of 60 Minutes. [21]

Awards and Honors

In October 2018, Daszak was elected to the National Academy of Medicine (NAM),[22] which the New York Times has been called the "most esteemed and authoritative adviser on issues of health and medicine" whose "reports can transform medical thinking around the world."[23] In 2000 he received the CSIRO medal for work on amphibian disease.

Scientist Bio for "Dr. Peter Daszak" from EcoHealth Alliance Org

Source - Ecohealth Alliance Org - [HC000E][GDrive]

Dr. Peter Daszak is President of EcoHealth Alliance, a US-based organization that conducts research and outreach programs on global health, conservation and international development. Dr. Daszak's research has been instrumental in identifying and predicting the origins and impact of emerging diseases across the globe. This includes identifying the bat origin of SARS, the drivers of Nipah virus emergence, publishing the first global emerging disease 'hotspots' map, discovering SADS coronavirus, designing a strategy to identify the number of unknown viruses in wildlife, launching the Global Virome Project, identifying the first case of a species extinction due to disease, and discovering the disease chytridiomycosis as the cause global amphibian declines. He is one of the founders of the field of Conservation Medicine and has been instrumental in the growth of EcoHealth, One Health, and now Planetary Health.

A fundamental part of the Dr. Daszak's work on disease ecology is directed by the conviction that disease outbreaks are not just predictable, but preventable. This approach is informed by a perspective on emerging infectious disease research that sees problems of human and animal disease as intimately linked – exacerbated by ecological change. With this in mind, he led the researcher that produced the first ever global emerging disease 'hotspots' map to determine where in the world viruses with pandemic potential are most likely to emerge, and developed a strategy to identify just how many of those viruses currently exist.

Dr. Daszak is a member of the National Academy of Medicine and Chair of the NASEM's Forum on Microbial Threats. He is a member of the NRC Advisory Committee to the US

Understanding the Risk of Bat Coronavirus Emergence Novel zoonotic, bat-origin CoVs are a significant threat to global health and food security, as the cause of SARS in China in 2002, the ongoing outbreak of MERS, and of a newly emerged Swine Acute Diarrhea Syndrome in China. In a previous R01 we found that bats in southern China harbor an extraordinary diversity of SARSr-CoVs, some of which can use human ACE2 to enter cells, infect humanized mouse models causing SARS-like illness, and evade available therapies or vaccines. We found that people living close to bat habitats are the primary risk groups for spillover, that at one site diverse SARSr-CoVs exist that contain every genetic element of the SARS-CoV genome, and identified serological evidence of human exposure among people living nearby. These findings have led to 18 published peer-reviewed papers, including two papers in Nature, and a review in Cell. Yet salient questions remain on the origin, diversity, capacity to cause illness, and risk of spillover of these viruses. In this R01 renewal we will address these issues through 3 specific aims:

Aim 1. Characterize the diversity and distribution of high spillover-risk SARSr-CoVs in bats in southern China. We will use phylogeographic and viral discovery curve analyses to target additional bat sample collection and molecular CoV screening to fill in gaps in our previous sampling and fully characterize natural SARSr-CoV diversity in southern China. We will sequence receptor binding domains (spike proteins) to identify viruses with the highest potential for spillover which we will include in our experimental investigations (Aim 3).

Aim 2. Community, and clinic-based syndromic, surveillance to capture SARSr-CoV spillover, routes of exposure and potential public health consequences. We will conduct biological-behavioral surveillance in high-risk populations, with known bat contact, in community and clinical settings to 1) identify risk factors for serological and PCR evidence of bat SARSr-CoVs; & 2) assess possible health effects of SARSr-CoVs infection in people. We will analyze bat-CoV serology against human-wildlife contact and exposure data to quantify risk factors and health impacts of SARSr-CoV spillover.

Aim 3. In vitro and in vivo characterization of SARSr-CoV spillover risk, coupled with spatial and phylogenetic analyses to identify the regions and viruses of public health concern. We will use S protein sequence data, infectious clone technology, in vitro and in vivo infection experiments and analysis of receptor binding to test the hypothesis that % divergence thresholds in S protein sequences predict spillover potential. We will combine these data with bat host distribution, viral diversity and phylogeny, human survey of risk behaviors and illness, and serology to identify SARSr-CoV spillover risk hotspots across southern China. Together these data and analyses will be critical for the future development of public health interventions and enhanced surveillance to prevent the re-emergence of SARS or the emergence of a novel SARSr-CoV.

Public Health Relevance

Daszak, Peter Renewal: Understanding the Risk of Bat Coronavirus Emergence Project Narrative Most emerging human viruses come from wildlife, and these represent a significant threat to public health and biosecurity in the US and globally, as was demonstrated by the SARS coronavirus pandemic of 2002-03. This project seeks to understand what factors allow coronaviruses, including close relatives to SARS, to evolve and jump into the human population by studying viral diversity in their animal reservoirs (bats), surveying people that live in high-risk communities in China for evidence of bat-coronavirus infection, and conducting laboratory experiments to analyze and predict which newly-discovered viruses pose the greatest threat to human health.

1991 research - "Ultrastructural studies of the effects of the ionophore lasalocid onEimeria tenella in chickens" (P. Daszak, S. J. Ball, R. M. Pittilo & C. C. Norton)

Parasitology Research volume 77, pages224–229(1991)Cite this article

https://link.springer.com/article/10.1007%2FBF00930862

Abstract : The ultrastructural development ofEimeria tenella was studied in experimentally infected chicks fed 90 ppm lasalocid, an ionophorous anticoccidial antibiotic. Drug treatment was timed to target-specific endogenous stages. At 6 h after infection, many sporozoites within the epithelium showed degradation as a result of drug action. Only a few intact sporozoites were seen. The drug caused outer-membrane blistering, large surface swellings and enlarged mitochondria in both first-and second-generation merozoites. No effect on the gamonts was discerned.

A Report of Intestinal Sarcocystosis in the Bullsnake (*Pituophis melanoleucus sayi*) and a Re-evaluation of *Sarcocystis* sp. from Snakes of the Genus *Pituophis*

Peter Daszak[1] and Andrew Cunningham,[2] [1] School of Life Sciences, Kingston University, Kingston-u-Thames, Surrey KT1 2EE, United Kingdom and [2] Veterinary Science Group, Institute of Zoology, Regent's Park, London NW1 4RY, United Kingdom

ABSTRACT: We report a severe enteric infection of *Sarcocystis* sp. from a wild-caught bullsnake (*Pituophis melanoleucus sayi*). The animal was collected in October 1988 by a commercial dealer, imported into the United Kingdom during November 1988 and purchased by the London Zoo, in December 1988. The animal was not fed after capture and was anorexic from the time of purchase to the time of death in January 1989. On necropsy, the animal was emaciated and the mucosa of the proximal intestine was markedly thickened. The lamina propria was packed with oocysts, and enterocytes were parasitized by an organism which closely resembled *Sarcocystis roudabushi* and *Sarcocystis idahoensis*, two bisporocystid coccidia described previously from *Pituophis melanoleucus*. We propose that *Sarcocystis idahoensis* and *Sarcocystis roudabushi* are synonymous since both occur in the same host species, both invade the intestinal lamina propria and enterocytes, and sporocyst measurement ranges of both species overlap. This is the first report of death believed to be due to sarcocystosis in a naturally-infected definitive host.

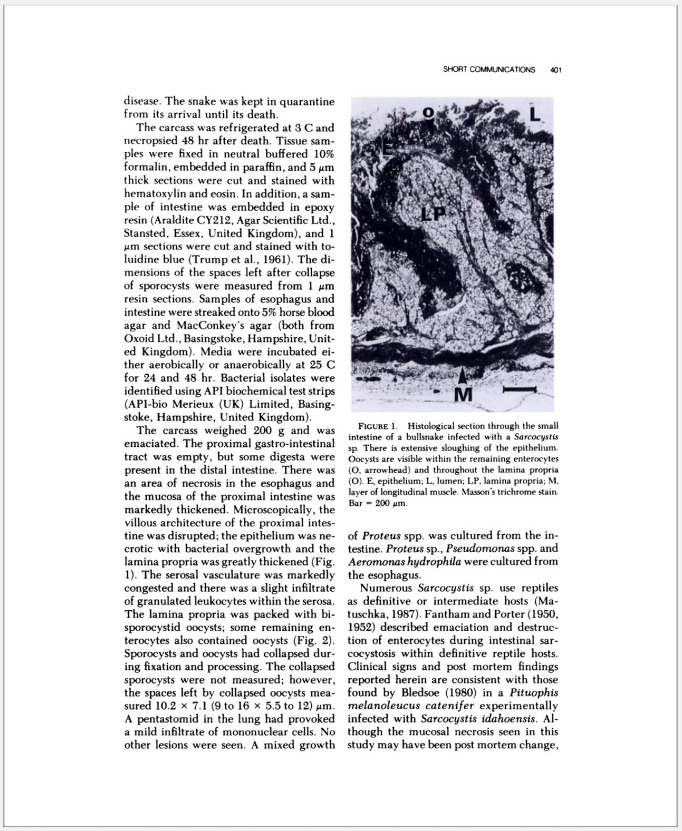
Key words: *Pituophis melanoleucus*, *Sarcocystis*, *Isospora*, sarcocystosis, pathology, taxonomy.

Sarcocystosis is an important disease of livestock caused by the asexual developmental stages of *Sarcocystis* spp. within non-intestinal tissues of the intermediate host (Dubey et al., 1989). In the definitive host, the parasite reproduces sexually within the intestinal mucosa. Reports of intestinal sarcocystosis causing clinical signs are rare, but occasionally symptoms of vomiting, diarrhea and anorexia have been reported in humans (Bunyaratvej et al., 1982). Here we report disease associated with an enteric infection of a *Sarcocystis* sp. in a wild-caught bullsnake (*Pituophis melanoleucus sayi*).

Identification of intestinal *Sarcocystis* spp. is complicated by the similarity of their oocysts and sporocysts to those of *Isospora* spp. and *Toxoplasma* spp. However *Sarcocystis* spp. undergo merogony in the intermediate host only (Dubey et al., 1989). The presence of fully sporulated oocysts within the host (endogenous sporulation) is another distinguishing characteristic (Upton et al., 1992). Only three coccidia with *Sarcocystis* sp. or *Isospora* sp. types of oocysts have been described in snakes of the genus *Pituophis*: *Sarcocystis roudabushi* Levine and Tadros, 1980, (Roudabush, 1937; Pellerdy, 1974) *S. idahoensis* Bledsoe, 1980 and an unnamed *Sarcocystis* sp. Upton et al. 1992 (Wacha and Christiansen, 1975). All are found in subspecies of *Pituophis melanoleucus*. In this paper we describe lesions associated with a *Sarcocystis* sp. in a wild-caught bullsnake, and propose that *S. roudabushi* and *S. idahoensis* are synonymous using the criteria by which they were originally described.

An adult male bullsnake (*Pituophis melanoleucus sayi*) was captured in northern Illinois within the area 39° to 42°N, 88° to 90°W, by a Tennessee dealer in October 1988. The snake was exported to the United Kingdom within 2 wk of capture, collected immediately upon arrival by a British dealer, who then sold the snake to London Zoo in mid-December 1988. Based on all available information, we believe that the snake was not fed in the USA between capture and export. The snake was not fed during or after import into the United Kingdom on 13 December 1988; indeed the snake refused to eat following purchase by the zoo until its death on 18 January 1989. The animal had no other signs of

Page 400 : [HP004Y][GDrive]



disease. The snake was kept in quarantine from its arrival until its death.

The carcass was refrigerated at 3 C and necropsied 48 hr after death. Tissue samples were fixed in neutral buffered 10% formalin, embedded in paraffin, and 5 μm thick sections were cut and stained with hematoxylin and eosin. In addition, a sample of intestine was embedded in epoxy resin (Araldite CY212, Agar Scientific Ltd., Stansted, Essex, United Kingdom), and 1 μm sections were cut and stained with toluidine blue (Trump et al., 1961). The dimensions of the spaces left after collapse of sporocysts were measured from 1 μm resin sections. Samples of esophagus and intestine were streaked onto 5% horse blood agar and MacConkey's agar (both from Oxoid Ltd., Basingstoke, Hampshire, United Kingdom). Media were incubated either aerobically or anaerobically at 25 C for 24 and 48 hr. Bacterial isolates were identified using API biochemical test strips (API-bio Merieux (UK) Limited, Basingstoke, Hampshire, United Kingdom).

The carcass weighed 200 g and was emaciated. The proximal gastro-intestinal tract was empty, but some digesta were present in the distal intestine. There was an area of necrosis in the esophagus and the mucosa of the proximal intestine was markedly thickened. Microscopically, the villous architecture of the proximal intestine was disrupted; the epithelium was necrotic with bacterial overgrowth and the lamina propria was greatly thickened (Fig. 1). The serosal vasculature was markedly congested and there was a slight infiltrate of granulated leukocytes within the serosa. The lamina propria was packed with bisporocystid oocysts; some remaining enterocytes also contained oocysts (Fig. 2). Sporocysts and oocysts had collapsed during fixation and processing. The collapsed sporocysts were not measured; however, the spaces left by collapsed oocysts measured 10.2 × 7.1 (9 to 16 × 5.5 to 12) μm. A pentastomid in the lung had provoked a mild infiltrate of mononuclear cells. No other lesions were seen. A mixed growth of *Proteus* spp. was cultured from the intestine. *Proteus* sp., *Pseudomonas* spp. and *Aeromonas hydrophila* were cultured from the esophagus.

FIGURE 1. Histological section through the small intestine of a bullsnake infected with a *Sarcocystis* sp. There is extensive sloughing of the epithelium. Oocysts are visible within the remaining enterocytes (O, arrowhead) and throughout the lamina propria (O). E, epithelium; L, lumen; LP, lamina propria; M, layer of longitudinal muscle. Masson's trichrome stain. Bar = 200 μm.

Numerous *Sarcocystis* sp. use reptiles as definitive or intermediate hosts (Matuschka, 1987). Fantham and Porter (1950, 1952) described emaciation and destruction of enterocytes during intestinal sarcocystosis within definitive reptile hosts. Clinical signs and post mortem findings reported herein are consistent with those found by Bledsoe (1980) in a *Pituophis melanoleucus catenifer* experimentally infected with *Sarcocystis idahoensis*. Although the mucosal necrosis seen in this study may have been post mortem change,

Abstract

AIMS: To determine the specificity of persistent measles virus infection in intestinal samples from Crohn's disease patients using quantitative immunogold electron microscopy. To compare the results with samples from ulcerative colitis, a granulomatous inflammatory control (tuberculous lymphadenitis), and a positive control. METHODS: Formalin fixed, paraffin embedded intestinal tissue from patients with Crohn's disease was reprocessed and stained with antimeasles nucleocaspid protein primary antibody followed by 10 nm gold conjugated secondary antibody. Tissue samples were taken from granulomatous and non-granulomatous areas of the intestine. Intestinal samples from patients with ulcerative colitis, tuberculous lymphadenitis, or acute mesenteric ischaemia were similarly processed. Brain tissue from a patient with subacute sclerosing panencephalitis (SSPE) was used as the positive control. Duplicate sections of all tissues were processed without the primary antibody. Stained specimens were examined by electron microscopy. RESULTS: In Crohn's disease patients, 8/9 foci of granulomatous inflammation and 0/4 foci of non-specific inflammation were positive for measles virus. Of controls, 0/5 non-inflamed intestinal tissues, 1/8 tuberculous tissues, 1/5 ulcerative colitis tissues, and 1/1 SSPE tissues were positive. Gold grain counts per nuclear field-of-view in both Crohn's disease granulomas (43.29) and SSPE (36.94) were significantly higher than in tissues from patients with ulcerative colitis (13.52) or tuberculous lymphadenitis (15.875), and nongranulomatous areas of Crohn's disease (4.89) ($p < 0.001$, $p < 0.001$, $p = 0.0006$, respectively), with no significant difference between Crohn's disease and SSPE ($p > 0.1$). In both SSPE and Crohn's disease staining was confined to a small population of cells exhibiting characteristic cytopathology. CONCLUSION: These data support a role for measles virus in the aetiology of Crohn's disease.

1998 (June 28) - NYTimes - "Newly Found Fungus Is Tied To Vanishing Species of Frog"

By Carol Kaesuk Yoon / [HN01HX][GDrive]

A newly discovered fungus appears to be the cause of an epidemic among amphibians that is killing off frogs and toads of a wide variety of declining species in rain forests in Australia and Central America, according to a new report by an international team of researchers. Scientists say the new study may help solve the mystery of why amphibians are vanishing around the world, often from pristine, isolated habitats.

Nineteen species of frogs, researchers report, are succumbing to a newly discovered fungus called a chytrid, a type of fungus known previously to live only on decaying matter and insects. Researchers say it remains to be seen how and why the fungus is killing frogs in such large numbers over such a wide area, as well as whether the fungus is doing its deadly work in areas other than Central America and Australia.

The research is described in a report to appear in next month's issue of the Proceedings of the National Academy of Sciences. The mystery of the vanishing amphibians has been plaguing scientists for a decade, ever since they began noticing that frogs were disappearing. At various times, researchers have proposed ultraviolet light, pollution and disease as the villains, but scientists lacked direct evidence that any of these factors was causing large, widespread declines.

Searching the tissues of dead frogs, biologists on the new study say, they found fungi as the clear culprit. When researchers scraped fungi off the skin of the dead frogs and infected the water of healthy frogs, within a couple of weeks all the exposed frogs were dead or dying. But while researchers described the new study as convincing, they noted that skin scrapes were not pure samples of fungus. To be sure that the fungus alone is killing the frogs, researchers must await the results of a last crucial test.

Dr. Joyce Longcore, chytrid fungal specialist at the University of Maine at Orono, said that she had grown a pure culture of the fungus and that she and colleagues at the National Zoo were in the process of doing the experiment find out whether the pure fungus can kill frogs.

Researchers say the new fungus is unlikely to be related to the limb deformities in Minnesota frogs.

The report that will appear next month provides a long-awaited answer for scientists, who had been mystified by the increasing reports of large numbers of dead frogs in rain forests in Central and South America and Australia. Quickly eaten by scavengers, wild frog cadavers are a rare sight, with biologists typically seeing no more than two or three in the wild in a lifetime. The numbers were "just stunning," said Dr. David Wake, amphibian biologist at the University of California at Berkeley. "When you find carcasses in a rain forest, you know you're only finding a tiny fragment of the number really there."

Researchers still do not know exactly how the fungus kills so many frogs, but say they suspect it is by suffocation. Frogs breathe not only through their lungs, but also by absorbing oxygen through their moist skin. As the fungus grows in the skin of frogs, the skin appears to grow more layers, making it more difficult for the frog to absorb oxygen.

While biologists say they are confident that the newly discovered fungus is the immediate cause of the death of these frogs, it is unclear whether the frogs were already weakened by other factors and so more susceptible. Researchers are now studying air, water and other samples from regions where the frogs died in a search for such factors.

Researchers agree that other factors are certainly at play in the amphibian deaths around the globe. For example, Dr. Wake said it was very likely that chemical contamination was involved in California and that ultraviolet light was a factor in Oregon.

"Nobody thinks there's a single answer to this problem," Dr. Wake said.

Researchers do not know why the fungal disease is emerging now. Dr. D. Earl Green, a veterinary pathologist who worked on the project at the Maryland Animal Health Laboratory, said the new fungus had been seen in healthy frogs from Maryland and Illinois, suggesting that the disease may be from more northern climes and made its way to the tropics recently, perhaps on the boot of a tourist or the net of a biologist. Once there, it might easily attack populations that had never been exposed to it before. Alternatively, the disease may have been around for years and is only now able to ravage populations weakened by other factors.

''It's one thing to go and look for frogs and say they're gone, but what we needed were the bodies to work on,'' said Dr. Peter Daszak, parasitologist at Kingston University in England and an author of the report. Now, with all the carcasses at their disposal, he said, ''at last we seem to be getting somewhere.''

Should scarce funds be used to build on world-beating research success or to boost ailing disciplines? **Lee Elliot Major** reports on a tough choice facing universities

Science friction

A battle between the sciences is in the offing. Universities are to be asked whether government funds should be focused on world-beating researchers in biology and biochemistry or used to bolster ailing disciplines such as engineering, where academics are falling behind researchers overseas.

University heads last week basked in praise for their researchers as Baroness Blackstone, the education and employment minister, trumpeted the UK's place as second only to the United States. With 1 per cent of the world's population, the UK carries out 5.5 per cent of the world's research effort, with an 8 per cent share of scientific publications and 9.1 per cent of all citations, she told the Committee of Vice Chancellors and Principals annual meeting in Manchester.

But in England hard questions will be prompted by a report soon to be published by the Higher Education Funding Council for England, which reveals a patchier picture than Baroness Blackstone painted. True, in most of the disciplines where international comparisons were made academics in English universities rank first in the world or second only to US researchers. But the strength in biological sciences is not matched on the international stage in engineering, concludes the report.

In England the funding council plans to consult universities on how the results of the study could be used to inform future allocations to different subject areas. Already the research councils, which fund specific projects in universities, are expected to channel more funds into the biological sciences following their funding boost in the government's Comprehensive Spending Review.

Yet the issue is a notoriously sensitive one. Sir Richard Brook, chief executive of the Engineering and Physical Sciences Research Council, thinks it a national requirement to maintain a research presence in engineering. "Engineering is a sine qua non if the country is to take full advantage of the opportunities made available by research in the sciences," he argued. But academic leaders representing the life sciences have been lobbying for extra support to make the most of their world lead, and ensure that their work is exploited by the country's pharmaceutical and biotechnology industries.

With new research fields constantly emerging and budgets frozen, the funding council is unable to satisfy all academic demands.

Commissioned by the funding council last year in an attempt to develop indicators of the international research strengths of different subject areas, the bibliometric study is unique in analysing published research papers and their citations in terms of the disciplines, or units of assessment, defined by the funding councils. The study finds that English researchers rank second or third in the world in terms of impact in 10 of 13 "super units of assessment" – clusters of similar disciplines.

In the medical sciences, England comes out only fractionally behind the world leader, the US, and far ahead of Germany in third place. In the biological sciences, the country is second to the US, but far ahead of other international competitors. In mathematics, the impact of English researchers is on a par with those in Germany, and in the physical sciences, the country ranks consistently third in the world.

In engineering, despite a healthy share of the world's published papers, the impact of England is found to rank below the world average and "is well behind its European competitors". Business studies is also found to perform poorly.

The report, produced by the Centre for Policy Studies in Education at the University of Leeds, has already provoked controversy when a first draft appeared earlier in the year. A report by the Science Policy Research Unit at the University of Sussex appeared to completely contradict the findings.

Yet in an introduction to the report, the Government's chief scientific adviser, Rob May, says that the key findings match those of an earlier analysis carried out by a team at the Office of Science and Technology.

Lee Elliot Major is deputy editor of Research Fortnight.

CLASS ACTS

New spawn: Bill Clinton and other frog lovers will be grateful to Peter Daszak of Kingston University, who has identified a fungus killing amphibians in remote areas of Australia and Central America. Vice-President Al Gore, perhaps mindful of his colleague's enthusiasm, has promised to push for funding from Congress to combat the global threat.

New era: You can't tell it's cool because you haven't a clue what the artists are doing. Next week, at the Institute of Contemporary Art, students from London, Paris, Dublin and Mallorca are showing multimedia displays including 3-D immersive interfaces and parallel storytelling on DVD. Just look knowingly and murmur: "Cutting edge, darling."

New vigour: Viagra makers Pfizer have the wonder cure for potent academic performance, too — money. The firm has just (we) endowed a chair of Exploratory Drug Delivery at Strathclyde University.

New home: After Kosovo is in the grip of ethnic cleansing, Stoke-on-Trent must have seemed heavenly to refugee Halit Kadiri. He even found someone in Staffordshire University's school of engineering who spoke Albanian when he applied to continue his studies.

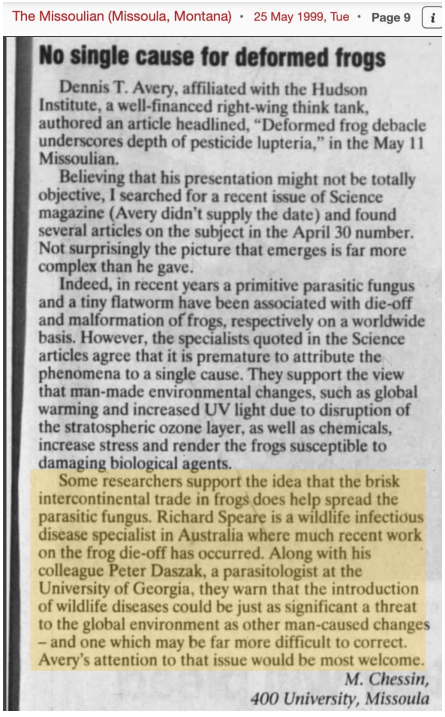
1999 (May 25) - Now a "parasitologist" at the University of Georgia

Full newspaper page : [HN01I0][GDrive]



The Missoulian (Missoula, Montana) • 25 May 1999, Tue • Page 9

No single cause for deformed frogs

Dennis T. Avery, affiliated with the Hudson Institute, a well-financed right-wing think tank, authored an article headlined, "Deformed frog debacle underscores depth of pesticide lupteria," in the May 11 Missoulian.

Believing that his presentation might not be totally objective, I searched for a recent issue of Science magazine (Avery didn't supply the date) and found several articles on the subject in the April 30 number. Not surprisingly the picture that emerges is far more complex than he gave.

Indeed, in recent years a primitive parasitic fungus and a tiny flatworm have been associated with die-off and malformation of frogs, respectively on a worldwide basis. However, the specialists quoted in the Science articles agree that it is premature to attribute the phenomena to a single cause. They support the view that man-made environmental changes, such as global warming and increased UV light due to disruption of the stratospheric ozone layer, as well as chemicals, increase stress and render the frogs susceptible to damaging biological agents.

Some researchers support the idea that the brisk intercontinental trade in frogs does help spread the parasitic fungus. Richard Speare is a wildlife infectious disease specialist in Australia where much recent work on the frog die-off has occurred. Along with his colleague Peter Daszak, a parasitologist at the University of Georgia, they warn that the introduction of wildlife diseases could be just as significant a threat to the global environment as other man-caused changes – and one which may be far more difficult to correct. Avery's attention to that issue would be most welcome.

NATION / WORLD

Disease on the rise among wildlife

WASHINGTON (AP) — While concern about newly evolving diseases has focused on humans, scientists warn that wildlife face the same threats as animals are forced into more crowded conditions and moved to new locations.

The causes of emerging diseases in animals are the same as for humans, explained Peter Daszak of the University of Georgia. "Basically, it's the globalization of the planet, things are taken abroad from one country to another and you spread diseases that way as well.

"We call it pathogen pollution," said Daszak, lead author of a paper appearing in today's edition of the journal Science.

Emerging infectious diseases can cause local extinctions among wild animals and in some cases even lead to total extinction of a species, he said.

"We need to take this issue seriously, especially if we are to take biodiversity seriously," Daszak said in a telephone interview.

He urged scientific research on the emerging diseases and social efforts to prevent their spread. He mentioned legislation to try to prevent the importation of diseases that affect wild animals; such steps now are taken to block foot and mouth disease, rabies and other diseases.

Emerging infectious diseases among wildlife not only threaten the future of the animals but also may form a reservoir of germs that could harm people and domestic animals, his team warns.

This kind of transmission may have been a factor in the emergence of the virus that causes AIDS as well as the newer Marburg and Ebola viruses, the paper notes.

The international transport of livestock and current agricultural practices have helped spread rinderpest in Africa and mad cow disease in Europe, for example.

'We need to take this issue seriously, especially if we are to take biodiversity seriously.'

Peter Daszak, author

Even the seemingly most innocent act can pose problems.

"Recent analysis suggests that 15,000 tons of peanuts are fed annually to United Kingdom garden birds. This form of provisioning has led to the emergence of infection by salmonella and E coli in Britain ... because of the high density and diversity of birds at feeding stations," the scientists reported. Similar reports have occurred in the United States.

As humans encroach on animal territory diseases can move back and forth between domestic and wild animals.

The paper notes that wild dogs became extinct in Africa's Serengeti in 1991, at the time canine distemper was raging among domestic dogs in the region.

Chickens first line of defense against West Nile virus

CHRISTOPHER A. RECORD / Associated Press
In Charlotte, Mark O'Donoghue holds a chicken that serves as one of the South's virus monitors.

By M.A.J. McKenna
mmckenna@ajc.com

Hendersonville, N.C. — The best defense against West Nile virus, the Third World pathogen that has unexpectedly invaded the East Coast, sits in a swampy corner of a county park in the heart of North Carolina's apple country.

And clucks.

Five white chickens brood in an improvised battery cage perched 4 feet off the ground to protect them against predators. Every day, Henderson County engineer Jerry Robinson feeds and waters thems and collects their eggs. Every two weeks, he draws a tablespoon of blood from a vein beneath one wing. Back at the county health department, the blood is centrifuged and refrigerated, then shipped to a lab in Raleigh to check whether the birds are infected.

The African virus that in 12 months has killed seven people, sickened 56 and killed thousands of wild birds from Massachusetts to Maryland — and for which there is no vaccine — has not yet turned up in Henderson County's chickens, nor in 57 other "sentinel flocks" across the state.

But health officials in North Carolina — and in Georgia and other states that are watching North Carolina for the first signs of virus in the South — don't expect that to last.

"West Nile virus will probably reach North Carolina late this year," said Dr. Nolan Newton of North Carolina's Department of Environment and Natural Resources. "If not, we will see it next summer."

West Nile virus is this summer's scary disease. Like hantavirus in 1993, Ebola in 1995 and the Hong Kong avian influenza in 1997 — and a new rodent-borne virus, announced Thursday, that appears to have killed three women in California — it is a reminder of how easily pathogens that infect animals can leap across species and take humans by surprise.

Among public health experts, though, it is a reminder of a second phenomenon as well: the frequency with which infectious diseases that once were thought confined to the Third World are menacing developed countries, too.

"West Nile virus shows us that new diseases can emerge at any time, unexpectedly," said Dr. Peter Daszak of the University of Georgia, a specialist in diseases of wildlife. "It is a sign of our globalized planet, with humans, animals and their products being transported internationally at an unprecedented rate."

The discovery last summer that

➤ PLEASE SEE Virus, E2

Virus: Chickens guard South

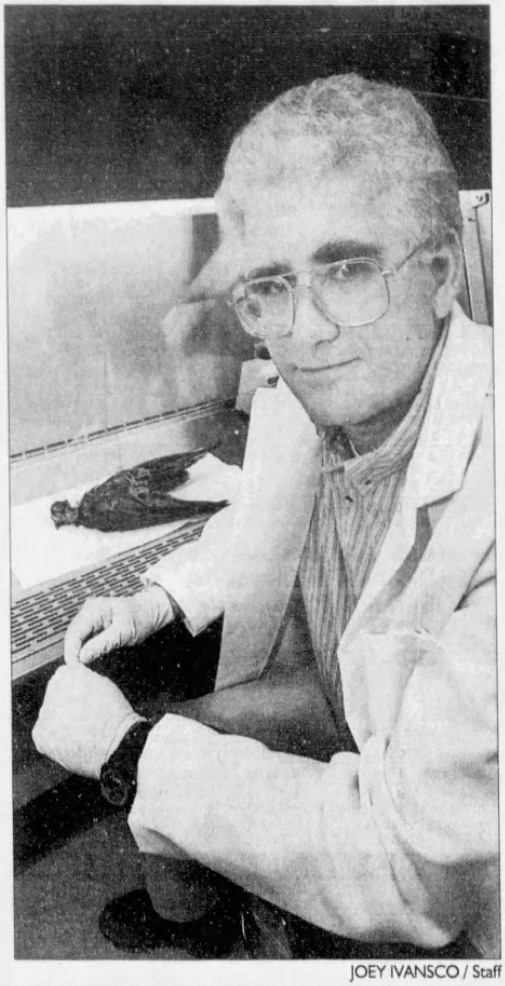
➤ Continued from E1

West Nile had arrived in New York, coupled with confirmation this month that the virus is circulating in at least three other states — New Jersey, Connecticut and Massachusetts — has triggered an extraordinary national effort to track the microbe. Led by the Centers for Disease Control and Prevention, the initiative has enlisted health departments in 17 at-risk states, including Georgia, which are collaborating to detect the disease as it migrates across borders.

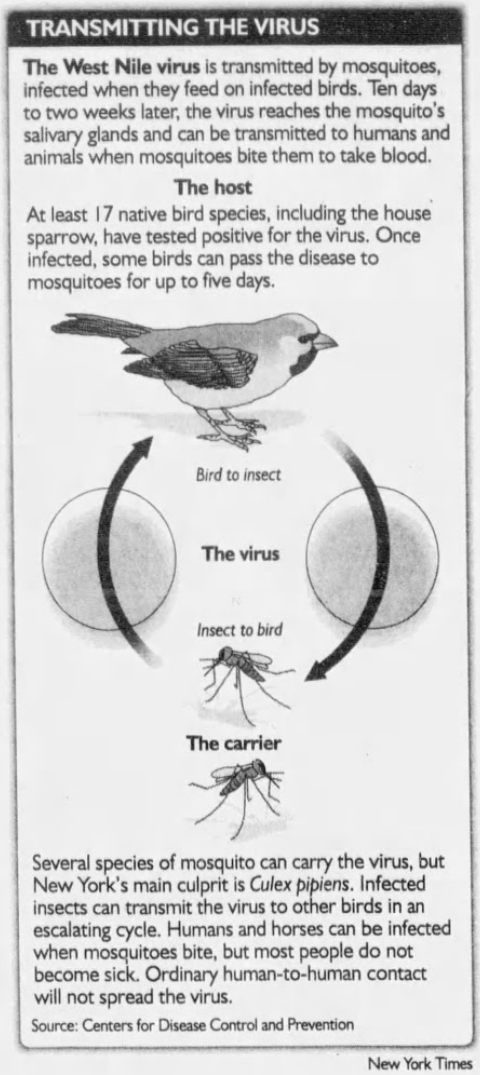
Like their counterparts in North Carolina, Georgia public health officials expect that West Nile virus will be detected here sometime in the coming months. Meanwhile, they are dealing with other insect-borne diseases that are less familiar to the public, pose potentially higher risks of illness and death, and — like West Nile — represent troubling new trends in infectious diseases.

"There is cause for awareness of West Nile virus," said Dr. Cathy Rebmann, head of Georgia's West Nile detection effort for the Division of Public Health, "but not for panic over it."

Humans acquire West Nile from mosquitoes, which transmit it from birds. Some bird species, such as chickens, can be infected without showing signs of illness: North Carolina's chicken flocks are the above-ground equivalent of canaries in a coal mine.



JOEY IVANSCO / Staff
This year in Georgia, blood samples from more than 1,000 geese, crows, pigeons and boat-tailed grackles have been analyzed, microbiologist David Stallknecht says, and none has shown signs of the West Nile virus.



New York Times

Wild birds also analyzed

Georgia maintains one sentinel-chicken flock, part of the Chatham County mosquito control program in Savannah. At the moment, detection in the rest of the state depends on analyses of dead and living wild birds performed by an independent agency in Athens, the Southeast Cooperative Wildlife Disease Study, funded by governments of South-

mosquitoes. When the birds land to rest or feed, they could be bitten by local mosquitoes, which would then transmit the virus to other birds and on to humans. So many migrating birds cross the Southeast that a new CDC study suggests South Georgia could actually become a significant site for the virus: The coastal plains of Georgia, northern Florida and

if not detected early. Since 1996, two Georgia residents were infected with malaria without leaving the state; until recently, public health authorities believed the disease had been eliminated from the United States.

There have also been two fatal cases of viral encephalitis, transmitted by mosquitoes, in North Carolina this summer, one not far

1.7 times by 2020.

Despite alarm over West Nile and other unrecognized diseases, public health experts stress that the potential for infection is largely under individuals' control. Insect-borne diseases cannot imperil humans unless the insects are given the chance to bite.

"We recognize, in public health, that people are often will-

ern states.

So far this year, the group has inspected blood samples from more than 1,000 geese, crows, pigeons and boat-tailed grackles, according to David Stallknecht, a scientist who is also assistant professor of medical microbiology at the University of Georgia College of Veterinary Medicine. None has shown signs of West Nile.

"We're also analyzing dead birds that are turned in by the public to county health departments," Stallknecht said. "We haven't had a lot of submissions so far — maybe 30, statewide — but we haven't had any virus isolations."

Public health experts predict that West Nile will arrive in Georgia in the bloodstream of migrating birds that were bitten somewhere north of here by infected

Alabama are winter habitat for some species that move through New Jersey and New York.

West Nile is the latest exotic to show up on Georgia's disease radar, but not the only one. Other insect-borne diseases already exist here or in nearby states: Eastern equine encephalitis, St. Louis encephalitis, La Crosse encephalitis, erlichiosis, Rocky Mountain spotted fever, malaria and dengue. Unlike West Nile, they have mostly not attracted public attention, though in some cases they pose a greater risk of illness or death.

So far this year, according to state statistics, there have been at least three cases of human monocytic erlichiosis and potentially 100 cases of Rocky Mountain spotted fever — two illnesses caused by ticks that can be fatal

from the Georgia border. And South Florida, along with southern Texas, is consistently recording cases of dengue, a mosquito-borne tropical disease.

Warm weather a factor

Authorities tracking the spread of emerging diseases fear the situation could get worse. Many insect-borne diseases are kept under control by the arrival of cold temperatures, because most mosquitoes don't survive winter. But the planet is warming: A study done by malaria experts at Maastricht University in the Netherlands suggests that temperate parts of the planet, including the Eastern U.S., will become friendlier environments for mosquitoes, and more vulnerable to the diseases they carry. Georgia's risk of malaria, they say, will rise

ing to take risks, for instance smoking, that they themselves can control, and unwilling to accept risks where they feel they don't have any control, such as potentially being bitten by a mosquito," said Dr. Susan Lance-Parker of the Georgia Division of Public Health. "So I try to encourage people to know that the diseases are out there, that their chances of contracting them are small, and that there are things they can do to lower the risk further.

"They should put screens on their windows . . . cover themselves when they go outside if they can and use repellents if that is not possible. And they should try to avoid being outside for extended periods during the time when the disease-bearing mosquitos are most likely to bite."

Contact with people making some wild animals sick

By Joan Lowy
Scripps Howard News Service

From seals in Europe suffering from flu to mountain gorillas in Africa laid low by measles, too much contact with people may be making wild animals sick.

While the threat to human health from diseases like AIDS and Ebola — which appear to have originated with wild animals — has garnered international attention, conservationists are increasingly concerned about the less well-known problem of people transmitting diseases to wild animals.

The problem is so acute for some animals that conservationists worry that a single epidemic could push species on the brink of extinction over the edge. Particularly at risk are primates because their close biological relationship with man makes them more susceptible to human illnesses and because the increasing destruction of their habitats throughout the world has brought them into closer and closer contact with people.

Mountain gorillas have suffered outbreaks of measles, while neighboring lowland gorillas have contracted yaws, a severely disfiguring skin disease historically found among some peoples native to Africa.

Chimpanzees have experienced polio outbreaks and annual outbreaks of respiratory ailments that look suspiciously like the flu. Orangutans captured in Borneo and Sumatra have contracted human malaria and tuberculosis.

Even some non-primate species may have been affected. Earlier this year, researchers at the University of Rotterdam reported discovering the influenza B virus — previously thought to have been strictly a human ailment — in seals washed up on the coast of the Netherlands. They estimated that from 0.5 percent to 2 percent of seals in the region were infected.

The strain found in seals was very closely related to an influenza B outbreak that swept through humans in Europe a few years ago, the researchers said.

Scientists call the problem "pathogen pollution," and they suspect it is far more widespread than previously thought.

"This is the thin end of the wedge," said Peter Daszak, a parasitologist with the University of Georgia who has examined the problem. "There is a lot more out there that we just haven't yet found out.

"I'm sure that over the next few years we will find more cases of human diseases or diseases that are present in our community with domestic animals that are spreading to wildlife. It's a huge problem."

The issue brings into question whether some of the people working the hardest to protect endangered species are inadvertently harming them as well. Scientists who study animals in the wild bring germs with them. Governments that promote ecotourism as an economic alternative to hunting and habitat destruction help bring historically isolated animals in contact with people from all over the world. Conservationists who care for endangered animals that have been illegally captured and try to return them to the wild may be sending them back to their homes harboring human or livestock disease germs.

"I think this is one of the giant sleeping issues in conservation," said Steve Osofsky, a wildlife veterinarian and director of field support for the World Wildlife Fund. "If you talk to most of the major conservation organizations, virtually none of them are routinely addressing disease issues as they plan and implement projects."

Scientists have known about the problem for a long time — naturalist Jane Goodall documented polio among chimpanzees in Gombe in Tanzania two decades ago — but only recently has there been a heightened awareness of the problem's seriousness.

"Traditionally, nobody bothered to look or nobody thought about the risk," said William Karesh, head of the field veterinarian program for the Wildlife Conservation Society. "A hundred years ago it was less significant, although it has probably led to the extinction of some species we don't know about."

Karesh headed an expedition to Africa earlier this year to gather evidence about which diseases lowland gorillas have been exposed to in the past, and which they have not.

Globalization speeds dangerous species' migration

By RICK MONTGOMERY
Knight Ridder Service

In the global economy, like it or not, mosquitoes can be big players, too.

The Asian tiger mosquito reached out to Western markets in 1985 when it jumped aboard a shipment of used tires headed to Houston. Water that had collected inside the tires provided a nice suite for the insect's journey to the other side of the world.

After the Asian tiger mosquito arrived in the United States, it spread from Texas to at least 20 other states, biting hard and carrying potentially lethal diseases such as encephalitis, which makes brains swell. U.S. health officials, unable to stop it, have been keeping an eye on the critter ever since.

No serious outbreak of human illness in this country has yet been linked to the imported pest. Still, its travels underscore an ancient truth: As people and products move around the globe, so do microscopic threats.

"In an increasingly globalized society, all sorts of wildlife diseases are getting through the net, moving from one country to another," said Peter Daszak, a wildlife-disease researcher at the University of Georgia. "It's impossible to prevent these invasions completely."

That is because infectious foreign agents – whether they're spreading the mysterious, such as mad cow disease, or bringing back old-time menaces, such as foot-and-mouth disease – have always been savvy hitchhikers.

Some move with people, some stow away in cargoes of fruit, some even catch long-distance rides on wind currents and ocean waves.

A few examples:

◆ A ferocious maple tree-eater from China, the Asian long-horned beetle, surfaced in Brooklyn in 1996. Scientists believe it immigrated by burrowing inside wooden shipping pallets.

> **"Certainly we're not going to stop every dangerous organism from coming into the U.S."**
> Dana DeWeese, Department of Agriculture

Within two years the coal-black bug had made its way to the Chicago area, where residents were ordered to destroy infested trees.

◆ New York City last year found itself in a war with the West Nile virus, which apparently had traveled by way of an African bird, an Asian mosquito and U.S. boats. Several persons died from encephalitis before the city conquered the intruder by spraying streets and storm drains with larvicide and urging people to rid their gutters of standing water.

◆ Toxic algae surfing the Pacific Ocean camped in California's Monterey Bay in 1998, killing hundreds of sea lions.

◆ Zebra mussels from Europe suddenly appeared in the Midwest in 1987, having hitched a ride in the ballast water of a ship that docked in the Great Lakes. Lacking natural predators in the United States, the striped invaders have been multiplying ever since, affixing themselves in bunches onto boat hulls and piers and clogging underwater pipes.

◆ "Whirling disease" has shown up in trout from California to New York. Thought to have been first brought to the United States in fish shipments from Denmark in the 1950s, parasites that cause the disease can travel on boots, remaining viable in dried mud for up to 30 years.

The foot-and-mouth virus is a weakling by comparison, scientists say. Though it quickly spreads among hoofed animals, it dies within a week outside a host. International travelers can rid themselves of it with soap and water.

The job of keeping U.S. borders safe from immigrant microbes rests with the Department of Agriculture's Animal and Plant Health Inspection Service. Its inspectors check cargo and passengers at airports and other points of entry.

They seize mangoes, fumigate cut flowers, hunt crates for fruit flies. They destroy 2 million pieces of contraband food a year. Last week, in an effort to protect against the spread of foot-and-mouth, they disinfected the shoes of travelers flying in from Europe.

"Certainly we're not going to stop every dangerous organism from coming into the U.S.," said Dana DeWeese, a plant health director for the service. "But we can take a risk-assessment approach" to reduce the threat of known viruses wreaking havoc on "the most economically important species," such as cows, pigs and sheep.

Although recent infections have raised concerns, the inherent dangers of globalization have lurked for centuries. And the results have been far more catastrophic.

It happens when foreign cultures meet: Spanish conquistadors introduced smallpox and measles to the Americas half a millennium ago, causing the deaths of tens of millions of South American natives. World War I helped unleash the 1918 influenza pandemic that killed more than 20 million people before the virus burned itself out.

Rather than erecting barriers between nations, a global approach is needed to ward off the dangers swirling in today's world marketplace, said researcher Daszak.

"We need to invest in more research, more inspectors, more communication and monitoring between countries," he said. "Increased surveillance is expensive. But it's much less than the cost of, say, foot-and-mouth spreading through U.S. livestock. That expense would be astronomical."

In 1998, health officials in Hong Kong acted swiftly to halt an unprecedented flu strain that had spread from poultry to people. Fears of a worldwide outbreak spurred the slaughter of every poultry bird in Hong Kong. The death toll among people was limited to a half-dozen.

Few experts are yet calling for steps as drastic as those advocated by Germany's new minister for agriculture, Renate Kuenast, who has suggested that nations shut down trade and rely only on products that can be locally grown.

"No country wants to be quarantined," said former U.S. Agriculture Secretary Dan Glickman. "What we're facing doesn't give us a reason to stop trade. But there is a reason to spend more money on prevention."

Some have learned to make the most of a bad situation. In Marshall, Texas, the residents throw a FireAnt Festival every October in honor of their pesky cohabitants – red imported fire ants – which accidentally arrived in Mobile, Ala., from South America more than 50 years ago.

The biting ants now infest more than 260 million acres in nine Southern states. In Marshall, however, they have their own mascot – Freddy the FireAnt – and people compete in fire-ant calling contests.

"We just can't get rid of these critters," said Phyllis Bryan, a Chamber of Commerce official who coordinates the celebration with a pesticide company. "So we've decided to relax a little and have a good time."

Birds of prey: W. Nile carriers are here to stay

BY ALAN BAVLEY
Knight Ridder News Service

KANSAS CITY, Mo. — In the forested lowlands of the Dominican Republic, University of Kansas biologists have found cuckoos, thrushes and a quail dove infected with West Nile virus.

Researchers from the Smithsonian Environmental Research Center have found the antibodies for the virus in more than a dozen native birds in Jamaica. There also have been reports of West Nile in horses and birds in Mexico.

These recent discoveries are testimony to just how rapidly West Nile virus has spread through the Western Hemisphere since it first appeared in New York four years ago.

But even more importantly, they are among the reasons scientists now say West Nile virus is here to stay, and that it may prove dangerous to people and devastating to wildlife for years to come.

'PERMANENT'

"The long and short of it is all of North America will have West Nile virus in the next two years," said biologist Andrew Townsend Peterson of KU's Natural History Museum and Biodiversity Research Center, which discovered West Nile in the Dominican Republic.

"It will become a permanent part of the landscape," Peterson said. "I think that's clear."

Last summer, the United States had the largest epidemic of severe West Nile illness on record anywhere. The disease spread across most of the country, making more than 4,000 people ill with fevers, headaches or body aches. It caused nearly 300 deaths. The virus also killed thousands of birds, horses and other animals.

West Nile is spread by mosquitoes that pick up the virus when they feed on the blood of infected birds. Infected mosquitoes then pass the disease to other birds, or to people or animals.

Scientists have found that some mosquitoes that carry West Nile can endure cold winters and possibly spread the virus again when the weather warms up.

The discovery of West Nile in the American tropics means the disease is now in areas where mosquitoes thrive year-round.

That opens the possibility that some of the hundreds of millions of migratory birds wintering in the Caribbean or Latin America may become infected and bring the virus with them when they return to their summer homes in the United States.

NONENDING CYCLE

"What we can think of as a possibility," Peterson said, "is a continuous cycle of West Nile virus in the tropics and an annual infusion in North America when the birds arrive in the spring."

Even if migratory birds do not catch the virus during their tropical sojourns, they may pick it up when they reach the Southeast. In February 2002, cases of West Nile were reported among horses and birds in four Florida counties.

Migratory birds that travel up the East Coast or into the Midwest may be largely responsible for spreading the disease across North America, said Peter Daszak, executive director of the Consortium for Conservation Medicine in Palisades, N.Y.

"More and more, the evidence points to migratory birds," he said. "That's going to be a big source of reintroduction of the virus. We're going to get outbreaks every year."

Daszak's consortium includes scientists who study how emerging diseases affect people and wildlife.

Daszak said we can expect large numbers of West Nile cases in the United States until people and animals develop immunity.

When that happens, the situation may become similar to that in Egypt where West Nile virus is common, but not considered a threat. People commonly become infected in childhood when the disease is usually mild and maintain immunity as adults.

The virus had spread rapidly since it first appeared in New York 4 years ago.

"But you have to be realistic," Daszak said. "I think it will take decades for this to happen here. It's going to be a bad problem for a long time. And it's going to stay with us forever."

Daszak also is concerned about what will happen as West Nile spreads farther south.

"It still has the whole of South America to conquer," he said. "Some South American cities will be badly hit."

So will a lot of endangered birds. Species that do not produce many offspring, or that live within a small geographical range will be particularly vulnerable, Daszak said.

SOME UNCERTAIN

Not every scientist is convinced that migratory birds are playing a significant role in the steady advance of West Nile virus.

John Rappole, a research scientist at the Smithsonian Conservation and Research Center in Front Royal, Va., was one of the first to suggest several years ago that migratory birds would keep West Nile an active threat despite any efforts to control mosquitoes.

Now he is not so sure.

If migratory birds were responsible for spreading West Nile, the virus should have spread faster, Rappole said.

"You could expect the disease to show up in South America in 1999," he said.

One reason why the evidence for migratory birds is not clear-cut is that no one has been able to find a migrating bird with an active West Nile infection.

"If I had to lay my money on something, it would be migratory birds," said Peter Marra, an animal ecologist with the Smithsonian Environmental Research Center in Edgewater, Md., who was involved in the discovery of West Nile in Jamaican birds.

"But we don't have a smoking gun yet," Marra said. "It's hard to catch a bird with the virus because they die so quickly."

Rappole said evidence now favors nonmigratory birds, the common house sparrow in particular, as the animals more likely responsible for spreading West Nile.

While the sparrows are considered "resident" birds that stay put all year rather than migrate, they can travel distances of 10 miles or more. And unlike crows and blue jays that often sicken and die when infected with West Nile, sparrows stay healthy. Sparrows also stay infectious longer than most other birds, researchers have found.

But finding evidence that nonmigratory birds are maintaining West Nile virus over the winter also may prove elusive.

Since January, Alex Bermudez of the University of Missouri-Columbia College of Veterinary Medicine has tested more than 440 birds for West Nile virus. The birds are captured and released from the James A. Reed Memorial Wildlife Area in Lee's Summit.

Most of the birds are nonmigratory Missouri natives; some have been migratory. So far, none has shown signs of the virus. Bermudez said he is not surprised.

"I was looking for something you wouldn't expect," he said. "But the birds acted as you'd expect they would."

ENVIRONMENT

Hurricanes spread plant diseases and ruin crops

The term "emerging infectious diseases" (EIDs) typically makes people think of HIV/AIDS, Ebola, or SARS. However, in a paper released today in the leading ecology journal *Trends in Ecology and Evolution*, an international team of researchers led by Wildlife Trust's Consortium for Conservation Medicine has highlighted a series of emerging plant diseases that are devastating crops globally, and impacting humans through agricultural and economic loss.

Nikkita Patel, Program Officer for the Consortium for Conservation Medicine, and lead researcher for the group, comments, "The recent spate of extreme weather events in Florida and elsewhere highlights the need to protect crops and wild plants from invasive pathogens that exploit the damaged environments following hurricanes." She notes that the reason these diseases are emerging is because we are changing the environment at such a rapid rate. Ms. Patel adds, "These highly evolved diseases are being given the chance of spreading into new regions, wiping out crops and wild plants as they go. Unless we radically change our approach and provide proper surveillance and control, these diseases have the potential to undermine the basis for our food security in the future."

The research team analyzed broad trends in emerging plant diseases and showed that:

·Extreme weather events, such as the hurricanes that hit Florida, are one of the leading causes of plant EIDs. This is due to the sensitivity of plants to fluctuations in moisture levels and the responses of plant pathogens to weather events. With projections that climate change will increase extreme weather events, disease-related die-offs will likely increase with time.

A series of key wild plant species are at risk of extinction due to emerging diseases. For example, the endangered cedar tree (*Torreya taxifolia*) is only found over a 154 square mile area of the Florida panhandle and is gradually being wiped out by a fungal disease and extreme weather events. This unique tree species once had a population of over 500,000, but is now reduced to only 1,500.

The underlying cause of most plant EIDs is the anthropogenic introduction of pathogens, or "pathogen pollution." This is related to changes in land use, global warming, and trade in plants and plant products.

Technological advances in agriculture are leaving global crops open to disease emergence. For example, in many developing countries the availability of year-round irrigation and declining market prices for staple crops has promoted increased intensity and acreage of non-traditional crop plants, thus promoting disease emergence.

The international trade in seeds is an estimated US $40-80 billion-per-year industry. Over 2,400 microorganisms are known to occur in seeds of 383 genera of plants. It is estimated that up to one-third of plant viruses are seed-borne. Improved surveillance and control of disease in this trade is urgently needed.

According to Peter Daszak, Executive Director of Wildlife Trust's Consortium for Conservation Medicine, "Not only are plant EIDs wiping out crops, they're threatening the biodiversity of plant life on our planet. With diseases like sudden oak death (*Phytophthora ramorum*) marching through our forests, we have an unprecedented risk for loss of ecosystems."

The team's results are part of a new approach to emerging diseases that stresses the need for predicting when and how diseases will emerge and dealing with them before they cause significant outbreaks. "If we can predict where diseases will occur, we'll be better equipped to handle them once they emerge," observed Mary Pearl, President of Wildlife Trust.

Pamela K. Anderson, Andrew A. Cunningham, Nikkita G. Patel, Francisco J. Morales, Paul R. Epstein and Peter Daszak. 2004. Emerging infectious diseases of plants: pathogen pollution, climate change and agrotechnology drivers. *Trends in Ecology & Evolution*

About The Consortium for Conservation Medicine

The Consortium for Conservation Medicine (CCM) is a unique collaborative institution that strives to understand the link between anthropogenic environmental change, health of all species, including humans, and the conservation of biodiversity.

About Wildlife Trust

Wildlife Trust is an international organization dedicated to innovative conservation science and conservation medicine, linking ecology and human health in the New York region and around the world. Wildlife Trust trains and supports a network of local scientists in over twenty countries in their efforts to save endangered species and their habitats and to protect the health of ecosystems that are vital to life on Earth.

Smuggled birds could bring avian flu

BY M.A.J. MCKENNA
COX NEWS SERVICE

ATLANTA — The small suitcase being carried through the Brussels airport by the traveler from Thailand looked unremarkable. But when customs officials opened it Oct. 18, they found a surprise: two rare small eagles, weak but healthy-looking, taped inside lengths of PVC pipe.

Their surprise turned to horror when tests on the eagles came back four days later: The smuggled birds were infected with avian influenza H5N1, the Southeast Asian virus that health authorities fear could blow up into a pandemic and kill millions.

The finding launched a frantic hunt for the man who carried the eagles, the officials who inspected them and the 135 passengers who shared the man's two flights. Twenty-three people were tested; 652 birds that had been in the airport, including the eagles, were destroyed.

The episode did not spark an outbreak, but it shook international health authorities. It demonstrated that the multibillion-dollar trade in smuggled wildlife could become an inadvertent and efficient ally in moving a lethal disease out of its home region, across oceans and around the world.

Underscoring that fear, three weeks later, customs officials in Taipei found 28 parrots packed into PVC pipe in a piece of hand luggage. The bag had been carried from Indonesia, another country grappling with H5N1 flu.

"Those are the ones that were caught. There are almost certainly others that have not been caught," said Dr. Peter Daszak, the executive director of the Consortium for Conservation Medicine in New York. "The global trade in wildlife is potentially a major source of imported disease."

So far this year, avian influenza H5N1 has sickened 44 humans in Thailand and Vietnam, killing 32 of them, as well as causing the slaughter or death from illness of more than 100 million birds - but it has not moved beyond eight countries in Southeast Asia.

Its potential for causing a pandemic, a devastating worldwide epidemic, will be discussed in Atlanta this morning by the American Medical Association's visiting House of Delegates. Speakers will include Dr. Julie Gerberding, director of the Centers for Disease Control and Prevention, and Dr. David Johnson of Aventis Pasteur, which became the United States' sole supplier of injectable flu vaccine for this winter after rival Chiron Corp.'s contaminated vaccine was impounded.

The ability of smuggled wildlife to cause wildlife disease has long been recognized: In 1971, a batch of parrots infected with a strain of Newcastle disease and brought illegally from Mexico, killed millions of poultry in California, causing $65 million in damage.

Eyeing early signs of bird flu

From veterinarians to bird-watchers, hundreds patrolling U.S. in effort to thwart arrival of virus

BY DONALD G. MCNEIL JR.
New York Times

DAVIS, Calif. — Bang! Inside an improvised duck blind – her parked car – Grace Lee presses a switch and her gun blasts a square of light volleyball net over the dirt road she is watching.

One of the two magpies she has baited into range with cornbread, cheese-flavored rice snacks and dog food is snagged, flopping furiously around.

"We mostly catch the young ones," Lee said. "These birds are too smart to be caught again. We get them once, and they don't shop here anymore."

With the country waiting nervously for avian flu to arrive, catching wild birds is no hobby. It has become part of a national early detection effort, and Lee, a researcher at the University of California in Davis, is a sentry on the country's epidemiological ramparts.

She is one of hundreds of ornithologists, veterinarians, amateur bird-watchers, park rangers and others being recruited by the National Wildlife Health Center to join a surveillance effort along the major American migratory flyways. They will test wild birds caught in nets; birds shot by hunters on public lands, who must check in with game wardens; and corpses from large bird die-offs in public parks or beaches.

The plan also calls for sampling bodies of water for the influenza virus, which is shed in bird feces. And it is designating some ducks and geese – like those in backyard flocks or living year-round in park ponds – as "sentinels" to be captured, tested, released and periodically retested.

Surveillance of poultry is already in place. Long-standing federal and state laws require farmers to report deaths of birds from any flu strain. The surveillance system was worked out this summer by the Agriculture Department, which oversees poultry, and the wildlife health center in Madison, Wis., part of the Interior Department. The Interior Department oversees wildlife including migratory birds, which are thought to be the most likely entry route for the flu virus.

Dr. Christopher Brand, the center's research chief, estimated the cost at $10 million. On Nov. 1, President Bush announced a $7.1 billion plan to guard against a flu pandemic; Brand said he hoped money for the surveillance system would come from that.

The sampling plan had a small test run this fall in Alaska, which Brand said was the obvious choice because of the flu's surprise appearance in Siberia in July. Birds from there mingle in the summer Arctic nesting grounds with birds that migrate down the North American coast.

Now the flu's recent crossing of Europe "has opened up more eyes," Brand said. It is unlikely that infected birds will cross the Atlantic, because most migrate north-south and the birds detected in Eastern Europe were from species that migrate to Africa. Still, Brand said, there is now talk of setting up a surveillance network for Greenland, eastern Canada and the East Coast.

The threat of avian flu has also sped a transformation that was begun by the fear of bioterrorism and fueled by the fight against West Nile virus: Veterinarians and doctors, as well as the agencies overseeing them, are joining forces.

Previously, said Dr. William Karesh, head of the field veterinary program at the Wildlife Conservation Society, which runs the Bronx Zoo, the two fields almost never worked in tandem.

"Human medicine and veterinary medicine have advanced beautifully in the last 30 years, but they were not linked," Karesh said. That has always frustrated him, he said, because "diseases don't care which way they flow; there is a whole world of bacteria, viruses and fungi that move between wild animals, domestic animals and humans."

Karesh described once trying to get a research grant for surveillance of animal diseases that infect humans, known as zoonoses. The National Institutes of Health told him to apply to the Department of Agriculture, he said, and officials there sent him to the Fish and Wildlife Service, which told him it had no mandate to study disease.

"Then we went to Homeland Security, and they understood what we were talking about," Karesh said. "But they said: 'You're an orphan. No one does this.' And in their rankings, we're lower than people trying to blow up the subway in New York."

Now, instead of sharing information haphazardly and getting into jurisdictional disputes – problems that cropped up during the 2003 monkeypox outbreak and in surveillance for mad cow disease – health officials are writing plans that emphasize teamwork.

The U.S. still does far better at animal surveillance than most other countries because its medical and veterinary systems are each excellent and because outbreaks cannot be hushed up – as, for example, the SARS outbreak was in China.

But zoonoses fall into a gray area, and the 2003 monkeypox outbreak in the Midwest is a perfect example of what can go wrong, said Peter Daszak, director of the Consortium for Conservation Medicine at the Wildlife Trust, a group specializing in human-animal diseases.

The disease, related to smallpox but less deadly, arrived in a shipment of 18 Gambian giant pouched rats imported for a Chicago pet store, where they infected prairie dogs. By summer's end, there were 37 confirmed human cases – none fatal, but some scary – mostly among prairie-dog owners.

"Millions of live animals come into the country each year, and very few have really good surveillance," Daszak said. "Fish and Wildlife checks cargoes to see if they have endangered species, but it's the USDA that does health checks, and they don't go unless it's an agricultural product, so the pet trade tends to get a pass."

"The CDC does a great job with outbreak investigation, but that's after the fact," he said of the federal Centers for Disease Control and Prevention. "After monkeypox, they put a blanket ban on rodents from some West African countries. But who's looking at rodents from other places? Nobody. And that's a gap."

2005 (Nov 06) - NYTimes - "Sentries in U.S. Seek Early Signs Of an Avian Flu"

By Donald G. McNeil Jr. / [HN01HV][GDrive]

DAVIS, Calif. - Bang! Inside an improvised duck blind -- her parked car -- Grace Y. Lee presses a switch, and her gun blasts a square of light volleyball net over the dirt road she is watching.

One of the two magpies she has baited into range with cornbread, cheese-flavored rice snacks and dog food is snagged, flopping furiously around.

"We mostly catch the young ones," Ms. Lee said. "These birds are too smart to be caught again. We get them once, and they don't shop here anymore."

With the country waiting nervously for avian flu to arrive, catching wild birds is no hobby. It has become part of a national early detection effort, and Ms. Lee, a researcher at the University of California here, is a sentry on the country's epidemiological ramparts.

She is one of hundreds of ornithologists, veterinarians, amateur bird-watchers, park rangers and others being recruited by the National Wildlife Health Center to join a surveillance effort along the major American migratory flyways. They will test wild birds caught in nets; birds shot by hunters on public lands, who must check in with game wardens; and corpses from large bird die-offs in public parks or on beaches.

The plan also calls for sampling bodies of water for the influenza virus, which is shed in bird feces. And it is designating some ducks and geese -- like those in backyard flocks or living year-round in park ponds -- as "sentinels" to be captured, tested, released and periodically retested.

Still, Dr. Brand said, there is now talk of setting up a surveillance network for Greenland, eastern Canada and the East Coast.

The threat of avian flu has also sped a transformation that was begun by the fear of bioterrorism and fueled by the fight against West Nile virus: veterinarians and doctors, as well as the agencies overseeing them, are joining forces.

Previously, said [**Dr. William Bamberger Karesh (born1955)**], head of the field veterinary program at the Wildlife Conservation Society, which runs the Bronx Zoo, the two fields almost never worked in tandem.

"Human medicine and veterinary medicine have advanced beautifully in the last 30 years, but they were not linked," Dr. Karesh said. That has always frustrated him, he said, because "diseases don't care which way they flow -- there is a whole world of bacteria, viruses and fungi that move between wild animals, domestic animals and humans."

[**Dr. William Bamberger Karesh (born1955)**] described once trying to get a research grant for surveillance of animal diseases that infect humans, known as zoonoses. The National Institutes of Health told him to apply to the Department of Agriculture, he said, and officials there sent him to the Fish and Wildlife Service, which told him it had no mandate to study disease.

"Then we went to Homeland Security, and they understood what we were talking about," Dr. Karesh said. "But they said: 'You're an orphan. No one does this.' And in their rankings, we're lower than people trying to blow up the subway in New York."

Now, instead of sharing information haphazardly and getting into jurisdictional disputes -- problems that cropped up during the 2003 monkeypox outbreak and in surveillance for mad cow disease -- health officials are writing plans that emphasize teamwork.

The United States still does far better at animal surveillance than most other countries because its medical and veterinary systems are each excellent and because outbreaks cannot be hushed up -- as, for example, the SARS outbreak was in China.

But zoonoses fall into a gray area, and the 2003 monkeypox outbreak in the Midwest is a perfect example of what can go wrong, said Peter Daszak, director of the Consortium for Conservation Medicine at the Wildlife Trust, a group specializing in human-animal diseases.

The disease, related to smallpox but less deadly, arrived in a shipment of 18 Gambian giant pouched rats imported for a Chicago pet store, where they infected prairie dogs. By summer's end, there were 37 confirmed human cases -- none fatal, but some scary -- mostly among prairie-dog owners.

"Millions of live animals come into the country each year, and very few have really good surveillance," Dr. Daszak said. "Fish and Wildlife checks cargoes to see if they have endangered species, but it's the U.S.D.A. that does health checks, and they don't go unless it's an agricultural product, so the pet trade tends to get a pass."

"The C.D.C. does a great job with outbreak investigation, but that's after the fact," he said of the federal Centers for Disease Control and Prevention. "After monkeypox, they put a blanket ban on rodents from some West African countries. But who's looking at rodents from other places? Nobody. And that's a gap."

Surveillance for diseases in wild animals is particularly difficult, since they do not come to hospitals, are not watched by veterinarians and do not like to be caught.

In the case of the magpie in Davis, it took Ms. Lee and her boss, Dr. Walter M. Boyce, director of the university's Wildlife Health Center, more than 30 minutes to disentangle the bird, set up a lab table, zip themselves into disposable coveralls and get a beak swab, a feces swab and a blood sample before releasing the miffed-looking bird, which high-tailed it for the nearest tree.

Dr. Boyce also gets swabs from hunters' ducks, and his colleagues at the state-run agriculture laboratory on campus get them from poultry farms and from

dead crows, jays and robins collected by city health departments on the watch for West Nile virus, which arrived in California earlier this year.

During the test run in Alaska, Dr. Jonathan Runstadler, a biology professor at the University of Alaska in Fairbanks, said he had collected nearly 5,000 fecal samples from ducks, geese, gulls and other shorebirds, owls and other raptors, and even songbirds.

With limited money, Dr. Runstadler could not mount his own bird-catching efforts, but university ornithologists and dedicated amateurs who study migratory patterns run what he called "ring and fling" leg-banding operations. "Our technicians and grad students go out with them, pull out a Q-Tip and say, 'Excuse me, can I take a sample here?' " he said.

Another difficulty is deciding which species to pursue. [**Dr. William Bamberger Karesh (born1955)**] expressed frustration that no country with birds dead of flu, from China to Romania, had noted which healthy species were nearby, because survivors were the more likely carriers, he said.

Which explains why Ms. Lee was netting birds that live year-round in Davis.

It's "a bit of a maverick approach," Dr. Boyce admitted, but his theory is that scavengers like magpies, crows and cattle egrets are the most likely vectors for moving the virus from the millions of ducks flying down California's Central Valley each fall to domestic chicken farms.

American industrial farms have high levels of biosecurity, penning thousands of birds in hangar-size barns "that no self-respecting duck or goose is looking to get into," Dr. Boyce said, "but there's a lot of free food there for an opportunist."

Since scavengers also bathe in the ponds where ducks stop over and hang around humans' garbage cans, he said, "we're looking for flu in species that can make the link between wildfowl, poultry and people."

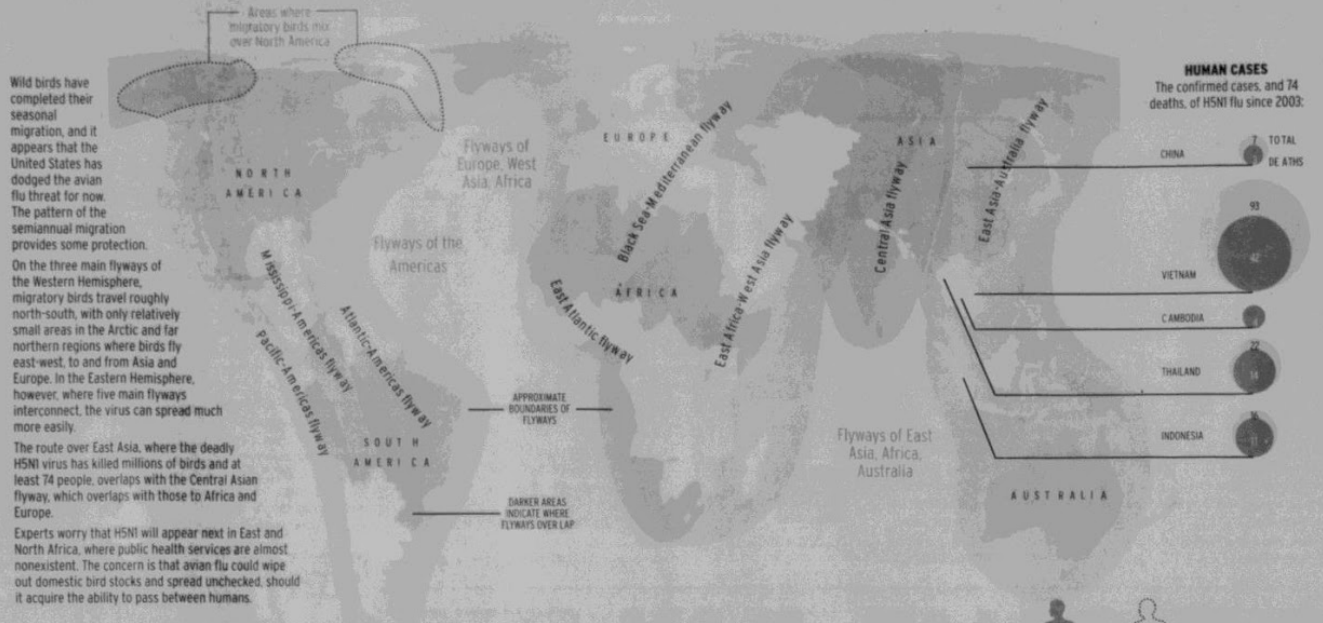
Dodging the avian flu

The only places where Asian, European and American migratory birds commingle is over northern and Arctic regions. But there is little mixing of flocks over these vast areas. The deadly form of the H5N1 strain in Asia has not been found in North America.



Wild birds have completed their seasonal migration, and it appears that the United States has dodged the avian flu threat for now. The pattern of the semiannual migration provides some protection.

On the three main flyways of the Western Hemisphere, migratory birds travel roughly north-south, with only relatively small areas in the Arctic and far northern regions where birds fly east-west, to and from Asia and Europe. In the Eastern Hemisphere, however, where five main flyways interconnect, the virus can spread much more easily.

The route over East Asia, where the deadly H5N1 virus has killed millions of birds and at least 74 people, overlaps with the Central Asian flyway, which overlaps with those to Africa and Europe.

Experts worry that H5N1 will appear next in East and North Africa, where public health services are almost nonexistent. The concern is that avian flu could wipe out domestic bird stocks and spread unchecked, should it acquire the ability to pass between humans.

Questions and unknowns

Is the risk to wild birds the same as it is to domesticated poultry?
H5N1 spreads easily among tightly confined domestic birds, but far more of these are deliberately killed to stop the spread of the flu.

Can some birds carry the virus and not get sick?
Only domesticated ducks are known to carry it without showing signs of sickness.

Can migrating birds carry the deadly form of the H5N1 virus for long periods?
It may kill some birds quickly, reducing chances to pass it to domestic birds; other birds may live for a week or two. Its effect on bird health is unknown.

Is the threat to domesticated birds in the United States different from the risk in Asia?
Most flocks of farmed birds in the United States are raised in "biosecure" complexes where they cannot mix with wild birds.

Will the H5N1 virus develop the ability to be transmitted from human to human? If so, how virulent will it be?
When the virus can move among humans, the question of migratory and domestic bird infection becomes moot and the pandemic risk is great.

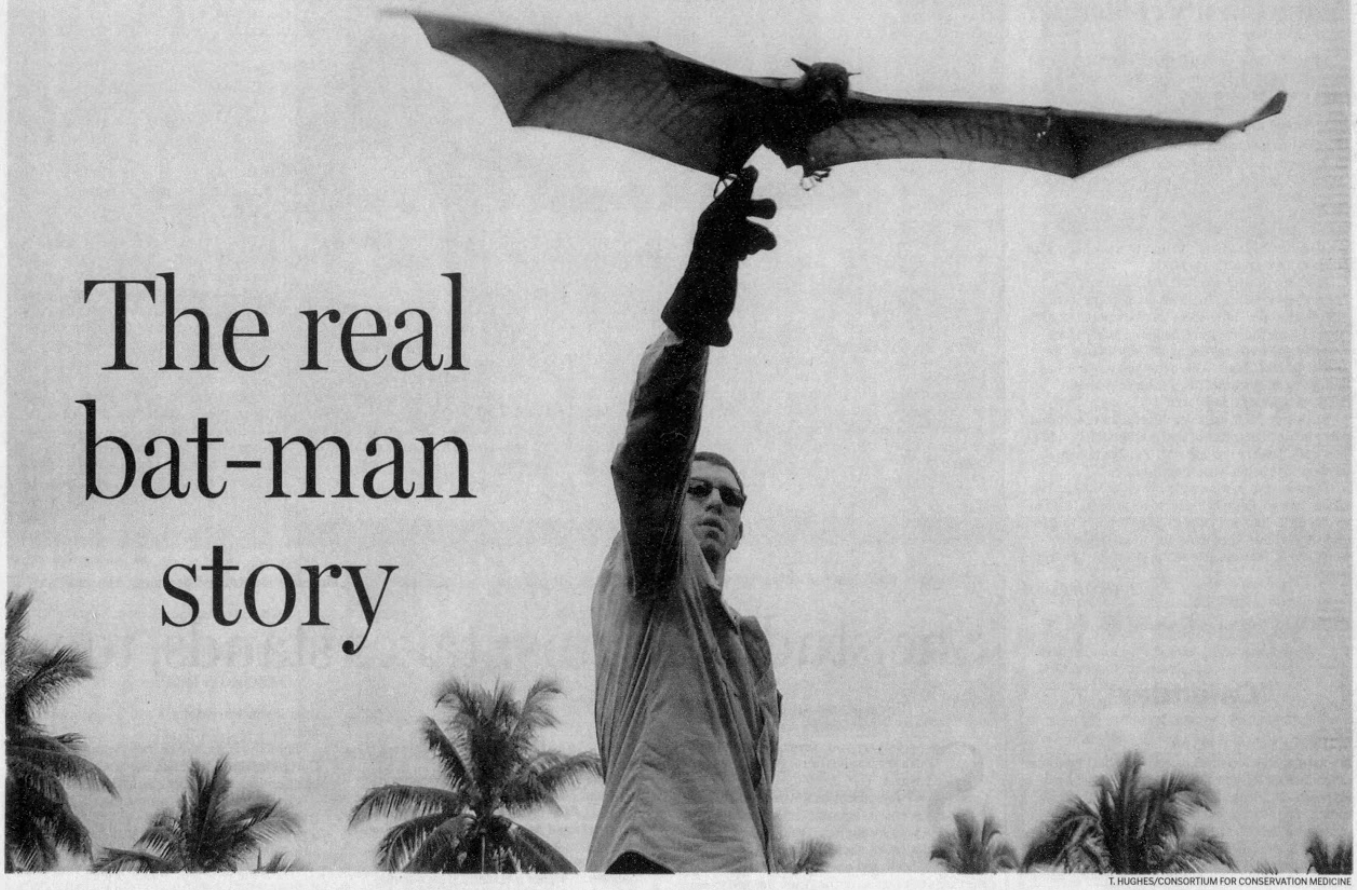
The real bat-man story



T. HUGHES/CONSORTIUM FOR CONSERVATION MEDICINE

Researcher Jonathan Epstein releases a migratory bat called a Malayan flying fox (Pteropus vampyrus), which is fitted with a satellite collar to track the bat's long-range movements.

True, bats carry deadly diseases, but it's human beings who cause the outbreaks

By Gareth Cook
GLOBE STAFF

Bats have been getting a bad rap.

Last fall, a team of scientists tied bats to the deadly SARS outbreaks. Bats in China, they said, are likely where the virus hides between human outbreaks. Then, in December, another group of researchers suggested that bats in Africa serve as a reservoir for the vicious virus for Ebola hemorrhagic fever, which causes its human victims to bleed to death. Bats have also been definitively tied to two other recently discovered viruses that are lethal to humans: Nipah and Hendra.

But as researchers have worked to uncover the mysterious links between bats and these emerging viruses, they say they have stumbled upon an even wilier culprit working behind the scenes: humans. It now seems that these outbreaks, and likely many others, were set off when people encroached on rain forests, expanded wild animal markets, or made other changes that removed the natural barriers that keep diseases at bay.

"This is not a wildlife problem, it is a human problem," said Jonathan Epstein, an American researcher who spoke by phone from Bangladesh, where he has been investigating the causes of Nipah outbreaks.

The insights that are coming from these outbreaks are feeding an emerging discipline that seeks to redefine the very meaning of health. Epstein and other proponents of this thinking, which they have dubbed "conservation medicine," argue that it is impossible to divorce human health from that of the environment. Emerging viruses like the one that causes SARS are symptoms of the drastic, large-scale changes humans are making in the life of the planet.

At a time of intense concern about avian flu, it is hardly controversial to argue that human health is linked to animal health. But the field challenges traditional academic di-

BATS, Page C4

Causes

Main factors pushing the emergence of new human illnesses:

1. Changes in land use or agricultural practices.
2. Changes in human demographics such as population growth.
3. Poor health, such as malnutrition.
4. Poor hospitals and medical procedures, such as lack of sterile needles.
5. Evolution of viruses and bacteria to become drug resistant.

Text below (NY TImes)

2006 (April 26) - NYTimes : "Blaming bats when man may be culprit"

By Gareth Cook / [HN01HW][GDrive]

Bats have been getting a bad rap. Last autumn, a team of scientists tied bats to the deadly SARS outbreaks. Bats in China, they said, are likely where the virus hides between human outbreaks. Then, in December, another group of researchers suggested that bats in Africa serve as a reservoir for the vicious virus for Ebola hemorrhagic fever, which causes its human victims to bleed to death.

Bats have also been definitively tied to two other recently discovered viruses that are lethal to humans: Nipah and Hendra.

But as researchers have worked to uncover the mysterious links between bats and these emerging viruses, they say they have stumbled upon an even wilier culprit working behind the scenes: humans. It now seems that these outbreaks, and likely many others, were set off when people encroached on rain forests, expanded wild animal markets, or made other changes that removed the natural barriers that keep diseases at bay.

"This is not a wildlife problem, it is a human problem," said Jonathan Epstein, an American researcher who spoke by phone from Bangladesh, where he has been investigating the causes of Nipah outbreaks.

The insights that are coming from these outbreaks are feeding an emerging discipline that seeks to redefine the very meaning of health. Epstein and other proponents of this thinking, which they have dubbed "conservation medicine," argue that it is impossible to divorce human health from that of the environment. Emerging viruses like the one that causes SARS are symptoms of the drastic, large-scale changes humans are making in the life of the planet.

At a time of intense concern about avian flu, it is hardly controversial to argue that human health is linked to animal health. But the field challenges traditional academic divisions, especially the cultural divide between doctors and veterinarians. Epstein is a senior research scientist at the New York-based Consortium for Conservation Medicine at Wildlife Trust, which organizes projects that cross the old disciplinary boundaries.

The consortium includes the Cummings School of Veterinary Medicine at Tufts University in Massachusetts, the Johns Hopkins Bloomberg School of Public Health in Maryland, and the United States Geological Survey National Wildlife Health Center in Wisconsin.

As researchers do their detective work around the world, they are finding connections between human society and disease. Global warming could push mosquito-borne diseases like malaria and encephalitis into more northern countries. One new bat-borne disease, the Nipah virus, was tied to the expansion of pig farming in Malaysia. Outbreaks of avian flu have been tied to farms, and the disease's spread has been helped by farmers reluctant to come forward with sick birds.

The researchers hope that by studying these connections, they will discover the means to prevent future epidemics.

After the 2003 outbreaks of SARS, which attacks the respiratory system, scientists initially identified an animal known as a civet as the disease's reservoir, the place where the virus sustains itself between outbreaks in humans. But further testing found that civets were not widely infected. In a paper published online by the journal Science last September, a team that included Epstein and scientists from China and Australia named a new suspect: cave-dwelling horseshoe bats. These bats, they reported, carry a family of viruses very similar to the one that causes SARS.

It is likely, the study found, that one of these "SARS-like" viruses evolved into the SARS virus at an exotic animal marketplace, where it infected civets, which, in turn, infected humans, according to Michael Farzan, a Harvard Medical School assistant professor who was not involved in the research.

But why did this happen when it did? One intriguing possibility is that it is linked to China's economic boom, according to Peter Daszak, a co-author of the SARS paper who is executive director of the Consortium for Conservation Medicine. With the newfound wealth there, he said, animal markets have grown as more people can afford fresh animal meat. As the markets grow, so do the chances that a virus will jump from one species to the next.

In December, a different group of researchers linked fruit bats to the dreaded Ebola virus. Outbreaks of the disease in humans have been associated with dramatic outbreaks among chimpanzees and gorillas. The team, working in Gabon and Congo Republic, captured various animals near the bodies of chimpanzees and gorillas. They then looked for signs of Ebola virus.

From this, the team found three different species of bats with antibodies to the virus, according to a paper in the journal Nature. Bats are now the leading suspect as the Ebola virus reservoir, but the case against them remains controversial, according to Jens Kuhn, an Ebola specialist at Harvard Medical School. It is thought that changes in human activity are behind the Ebola outbreaks - such as new mining operations deep in forests and the eating of primate meat - Kuhn said, but nobody knows the true origin.

The ties between bats and disease have raised fears in the conservation community that the winged creatures, long maligned and misunderstood, will become the targets of calls for elimination. This would be a mistake, researchers said, because bats play important environmental roles, such as eating pests - and killing off bats would be very difficult in any case.

There are about 1,000 species of bats, making up a fifth of all mammal species.

Kenosha News (Kenosha, Wisconsin) · 06 Jun 2006, Tue · Page 4

Mosquitoes appear to be drawn to robins

NEWSDAY

Think you're a mosquito magnet? At least you're not a robin.

Two independent studies suggest the American robin may be a prime source of blood for Culex mosquitoes in Northeast and Mid-Atlantic states and as such, the single biggest summer reservoir of the West Nile virus.

"What happens with American robins is not only do mosquitoes prefer to feed on them, but they produce a lot of viral particles and survive the infection," said Peter Daszak, co-author of one of the studies and author of one of the studies and executive director of the Manhattan-based Consortium for Conservation Medicine. "American robins are much more responsible for propagating the virus and infecting mosquitoes than other birds such as crows or house sparrows."

Researchers cannot yet explain the source of the attraction, whether based on the robin's color, a chemical signal or a more exposed night roost.

"When the robins move away in later summer, suddenly these mosquitoes are looking around for something else to feed on," he said, "and unfortunately they pick on us."

Parasite puts pandas at risk, research finds

Steve Sternberg
USA Today

A new natural enemy is preying upon China's shrinking population of wild pandas, posing a "significant threat" to their survival, researchers say.

Stalked to near extinction by poachers and decimated by starvation, China's most beloved creatures are now also dying of a disease most likely caused by a roundworm called Baylisascaris schroederi, which can infect the brain and other vital organs.

"It's the most significant cause of death in the last decade, and it seems to be increasing," says study author Peter Daszak of the Consortium for Conservation Medicine, a collaboration of the Wildlife Trust and several universities focused on the interactions of humans, wildlife and disease-causing organisms.

Daszak says the parasite accounts for 50 percent of the known deaths over the last five years, and the percentage has risen since 1971. Though the number of pandas studied is small, researchers call the findings a reliable indication that pandas have a new foe. "Where people have looked, this is what they've found," he says. "The true mortality is likely to be higher."

Because pandas are so rare, with just about 1,600 in the wild, "any panda death is bad news," he says.

Researchers believe the pandas' infections may result from steadily shrinking habitat, which puts the animals in closer contact. The parasite is transmitted through infected droppings. "Crowd a bunch of pandas into a smaller and smaller habitat, the likelihood that they'll get infected with this parasite will increase," says co-author Marm Kilpatrick, also of the consortium.

Study: New diseases appear in 'hot spots'

New germs

Since the 1940s, the number of emerging infectious diseases increased each decade before spiking in the 1980s.

Emerging infectious diseases

By decade

SOURCE: Nature AP

The Associated Press

NEW YORK — New infectious diseases have been appearing more often, says a study that suggests "hot spots" where the next new germs are most likely to appear.

"We need to be out there in the hot spot regions looking for the next HIV," said study co-author Peter Daszak.

Daszak, the executive director of the New York-based Consortium for Conservation Medicine at Wildlife Trust, and other researchers present their analysis in Thursday's issue of the journal Nature.

Experts called it the most thoroughly documented report yet to show a past increase in new infectious diseases and to predict where they might appear next.

To designate the hot spots, researchers found 335 appearances of new disease between 1940 and 2004, and then analyzed social and environmental factors that appeared to promote them. Most disease events involved germs new to humans, but researchers also counted illnesses from established germs that had become drug-resistant, moved into a new region or had become much more common.

Decade-by-decade, such incidents grew steadily from 25 in the 1940s to 98 in the 1990s, except for a spike of 103 during the 1980s.

Some proposed future hot spots were for illnesses that emerge from wildlife, as the AIDS virus HIV did from chimpanzees.

The researchers said the highest risk areas are in parts of east Asia, Central America and South America, the Indian subcontinent, Africa, western Europe and some population centers of North America. That's because the historical analysis had found the risk of such diseases goes up with factors like high population density and diversity of wildlife, the researchers said.

Peter Cowen, of North Carolina State University, who didn't participate in the study, called the hot spot analysis "a good guesstimate."

Wildlife trade brings tarantulas, pythons

By David Fleshler and Dana Williams
SUN SENTINEL

FORT LAUDERDALE, Fla. — They arrive from Amazon rainforests, central African savannahs and south Asian jungles, crated passengers in the cargo holds of airliners.

Spitting cobras, common death adders, Zanzibar dwarf geckos, green iguanas, chinchillas, emperor scorpions and hundreds of other non-native species enter the United States each year to serve the demand for unusual pets.

A lot of time has gone into the unsuccessful campaign to clear the Everglades of Burmese pythons, just one of the non-native species to find a congenial home in South Florida. But the federal government continues to allow wide-open imports of a vast range of wildlife, conducting few screenings for disease and permitting most shipments to enter without inspection. A report on wildlife imports by the Government Accountability Office last month found "gaps that could allow the introduction of diseases into the United States."

A Sun Sentinel review of live wildlife import records from 2004 through April of 2010 found that the United States imported these animals:

More than 739,000 rodents, despite warnings from the Centers for Disease Control and prevention that rodents can transmit to humans diseases such as hantavirus, bartonella and typhus.

Nearly 20,000 venomous snakes, among which are some of the most deadly, including 632 puff adders, 113 black mambas and 357 king cobras.

More than 1.2 million green iguanas, as well as other species that have become established in the United States, including 39,673 Nile monitors and 20,806 Burmese pythons. Several of these non-native species kill native wildlife.

A bill in Congress would have restricted imports to those species that had been approved as harmless, but an outcry from wildlife owners and the pet industry defeated it. The U.S. Fish and Wildlife Service is completing the process to declare the Burmese python and eight other big snakes injurious species, which would end imports except for zoos and a few other purposes.

Environmental and animal welfare groups say the python proposal has come too late to help the Everglades, and they call for import limits to keep out the next harmful species.

"If the federal government had listed the Burmese python as injurious 20 years ago, we wouldn't have had this problem," said Beth Preiss, exotic pets director for the Humane Society of the United States. "It may be too late to stop the invasion of the Everglades, but it's not too let to stop it in the rest of the U.S."

But the pet industry and hobbyist groups have fought back. They note that a cold snap last year killed a lot of the Everglades pythons. They say import limits represent an extreme response to problems caused by a few species. And they say tough restrictions would cost jobs and undermine a beneficial pastime that fosters in children an appreciation of science and nature.

"A lot of children spend hours in front of the TV and the computer and have very little contact with nature," said Jamie Reaser, vice president of environmental policy for the Pet Industry Joint Advisory Council, a trade group. "So I think it's very important children have the opportunity to learn about animals and the environment."

■■■

The wooden crates rest on the cement floor of a warehouse at Miami International Airport, second only to Los Angeles in live wildlife shipments into the United States.

U.S. Fish and Wildlife Service inspector Carlos Pages dons black gloves and pries open a long crate from Suriname, a nation with rain forests that extend into the Amazon basin.

The box contains a row of bright yellow sacks. When he picks one up, it starts moving. Inserting a plastic tube the size of a Pringles container that lets him look inside safely, he sees the glistening skin of an emerald tree boa. Although the snake is not venomous, he is careful. "These snakes have a nasty disposition," he says. "They will bite."

Last year Miami International Airport received 4,786 shipments of live wildlife. Among the biggest importers is Strictly Reptiles in Hollywood, whose president, Michael Van Nostrand, was sentenced to eight months in prison in 1997 for smuggling 1,500 rare reptiles from Argentina and Indonesia. After serving a five-year license suspension, the company has resumed importing. From 2004 until April of this year, Strictly Reptiles imported 558,060 reptiles, 172,892 spiders and 161,597 amphibians, according to federal records.

Reached by phone, Van Nostrand initially agreed to an interview but then could not be reached despite repeated phone calls.

D.J. Schubert, wildlife biologist for the Animal Welfare Institute, said the import business is riddled with opportunities for animals to suffer.

"They can be held for a long time without water or food," he said. "Frequently they're held in boxes or burlap sacks. The entire industry facilitates cruelty, not because people are trying to be mean, but because they don't know any better."

A raid last year by the U.S. Fish and Wildlife Service found horrific conditions at U.S. Global Exotics in Arlington, Texas, with more than 26,000 snakes, hamsters, wallabies, sloths and other animals crowded into filthy cages without food or water, many dead or dying.

Reaser, of the pet trade group, said that case was an exception in the industry that works hard to keep its valuable cargo safe.

"I think it's important to keep in mind that a lot of people in the pet industry got into it because they really love animals," she said. "There's an economic investment, and it doesn't make good business sense not to care for the animals."

■■■

About 60 percent of infectious diseases emerging in humans since 1940 — including AIDS and severe acute respiratory syndrome — originated in animals, making the jump to people through live-animal markets, the butchering process and the pet trade.

Dr. Nina Marano, chief of the Geographic Medicine and Health Promotion Branch of the Centers CDC, said rodents particularly are effective at transmitting diseases such as the deadly viral disease hantavirus pulmonary syndrome, a chronic bacterial illness called bartonella and various forms of typhus.

Monkeypox, a viral disease from Africa, appeared in people in the United States in 2003, arriving in a shipment of rodents from Ghana to Texas. The CDC banned rodent imports from Africa, but the pet industry found other sources. Since 2004 more than 739,000 dwarf hamsters, chinchillas, golden hamsters and other rodents have been imported, with the largest numbers coming from captive breeders in the Netherlands and the Czech Republic, according to the Sun Sentinel's review of import data.

"Rodents carry many viral diseases," Marano said. She was particularly concerned about children, who are often the caretakers for these animals and "who aren't known for regularly washing their hands."

"African rodents have been banned, but we've discovered that the pet industry is very fluid," Marano said. "When one door closes, they find another one to open."

The U.S. Fish and Wildlife Service said it's not practical to screen millions of animals for diseases. The service has 124 inspectors at 38 entry points to watch for smuggling, improperly packed animals and banned species. Adding disease to the list would be "tough," said Edward Grace, deputy chief of law enforcement for the Fish and Wildlife Service.

"Our inspectors don't have the veterinary skills to determine if an animal is ill or may be a disease vector," he said.

Peter Daszak, president of EcoHealth Alliance, a group that researches wildlife diseases, said agricultural livestock imports receive tougher scrutiny.

"If you're importing cattle, we're going to test them for hoof-and-mouth disease," he said. "But if you bring in a shipment of rodents from Indonesia, we don't test them for anything. They don't want anything to stop the pet trade, and I understand that. There's a lot of money and a lot of jobs."

■■■

Although Burmese pythons have attracted the most attention, up to 130 other non-native species have established themselves in Florida.

Mexican red rump tarantulas live around an abandoned citrus grove near Fort Pierce. Venomous red lionfish, refugees from the tropical fish trade, inhabit coral reefs. The African rock python, a large and powerful constrictor, lurks around Tamiami Trail in western Miami-Dade County, where 18 have been captured since August 2009.

In coastal Broward, Palm Beach and Miami-Dade counties, a Bahamian lizard called the northern curly-tail has crowded out native lizards. Tegu lizards, which can grow longer than four feet, prowl Homestead and the Tampa suburbs.

"The vast majority are from the pet trade," said Scott Hardin, non-native species coordinator for the Florida Fish and Wildlife Conservation Commission. "Mostly it's from pets that have been released."

■■■

These animals are sold by big-box pet stores, at wildlife shows, over the Internet and at specialty shops.

Underground Reptiles in Deerfield Beach offers a ring-tailed lemur ($2,799.99), a small South American mammal called a kinkajou ($3,249.99) and two baby marmosets ($2,799.99). In a corner, behind a sign reading "Dangerous Live Venomous Snakes," glass cases contained black and white spitting cobras, a West African Gaboon viper and a white-lipped tree viper.

At the Rodeway Inn & Suites on State Road 84 in Fort Lauderdale, the Florida Reptile and Alternative Pet Super Show last month drew dealers and hobbyists to a long conference room to buy and sell pythons, tarantulas and geckos.

"I don't do normal animals," said Tyler Cowan, 14, of Lake Worth, who had purchased a sunglow leopard gecko and a bearded gecko. "I don't like anything furry. I have two leopard geckos, a bearded dragon, a black and white Argentine tegu — such a sweetie. Think of it as a scaly puppy dog."

Anna Harvey, of Davie, wanted a snake for her 6-year-old son. "He is obsessed with reptiles," she said. She asked one dealer, Jay Eaton, whether a $40 king snake would make a nice friend for her son's ball python. Friend? Probably not, he said.

2010-12-05-clovis-news-journal-pg-13-a-clip-wildlife-text.jpeg

2011 (Nov 24) - NYTimes : "Global Trade Spreads a Fatal Amphibian Disease"

BY JIM ROBBINS NOVEMBER 24, 2011 6:00 AM / [HN01HU][GDrive]

Kenneth H. Thomas / Photo Researchers, Inc. American bullfrogs are resistant to the lethal amphibian disease known as chytrid, and since they are commonly traded overseas, they are becoming the Typhoid Marys of the amphibian world.

A recent study in the Proceedings of the National Academy of Science reported that global trade in amphibians is one of the big culprits in spreading a fungal disease known as chytrid, responsible for the stunning die-off of amphibians across the world.

Half of all amphibians are in decline, while a third are threatened with extinction, because of the pathogen, which carries the formal name Batrachochytrium dendrobatidis. It infects the amphibians' skin cells — through which most amphibians take in water and salts, including those of sodium and potassium — and thickens the skin, reducing its ability to absorb water and salts.

The recent study indicates that not only has the trade spread the disease, it may have created it.

Rhys Farrer of the Imperial College London and his team foundthat different strains of the chytrid fungus were identified in different parts of the globe. Through sequencing of the fungal genome, they found that the extremely lethal form of the fungus was created when two distinct strains came together to create a potent killer.

A likely explanation is that the global trade during the last century brought two strains together, experts say. "Chytrid is one of the most devastating wildlife diseases with the largest host range of any, and responsible for dozens of species' extinctions and many more extirpations of local populations," Dr. Farrer said.

The finding highlights the dangers of the worldwide movement of wildlife, including the huge global trade in pets. According toEcoHealth Alliance, a New York nonprofit that researches and works to prevent disease caused by wildlife, 120 million animals – fish, birds and reptiles – are shipped around the globe annually, legally and illegally.

American bullfrogs, which are carriers of the chytrid pathogen but resistant to it, are also widely available for sale; another study, done in 2009, looked at records from the ports of San Francisco, Los Angeles and New York from 2000 through 2005 and found "Importation of live amphibians into these ports totaled almost 28 million individuals over this six-year period."

The illegal wildlife trade, valued at as much as $20 billion a year, is second only to the drug trade in terms of its worth, according to EcoHealth. Some 13 million animals are taken illegally from ecosystems for the pet trade. Many of those species come from "hot spots" in tropical regions where the risk of diseases' emergence from the wild are high.

Even legal wildlife importation poses a disease risk, not only to other wildlife but to people as well. Diseases in other mammals pose the biggest threat to humans of all wildlife ailments, said Dr. Peter Daszak, president of EcoHealth. "Phylogenetically they are closer to us, which means we are more likely to share viruses we carry." he said. "That means if we get infected there's a higher change of that virus being transmitted human to human."

One species that he is particularly worried might pass a disease into the human sphere is the sugar glider from Indonesia.

Associated Press A baby sugar glider in a Minnesota home

"They are extremely cute, really good looking little animals, very cheap and very trendy," Dr. Daszak said. The trouble is, he said, they are coming in straight from the forest, in an emerging disease hotspot.

Plucking animals out of the wild can also cause declines in populations and lead to extinctions.

Earlier this year the EcoHealth Alliance started a program calledPetWatch that seeks to educate consumers to the dangers of exotic diseases on imported pets, from parrots to turtles to monkeys. They also include factors like invasive threats, the sustainability of wild populations and animal welfare issues.

The best bet for a disease-free animal is one that is bred in captivity and so is unlikely to harbor a disease from the wild. Among the best choices, according to Pet Watch, are the bearded dragon and cockatiels, while the worst include the African grey parrot and the squirrel monkey.

Infectious diseases unleashed

when people mess with nature

Many emerging illnesses have spread to humans from animals

JIM ROBBINS
New York Times News Service

There's a term biologists and economists use these days – ecosystem services – which refers to the many ways nature supports the human endeavour. Forests filter the water we drink, for example, and birds and bees pollinate crops, both of which have substantial economic, as well as biological, value.

If we fail to understand and take care of the natural world, it can cause a breakdown of these systems and come back to haunt us in ways we know little about. A critical example is a developing model of infectious disease that shows that most epidemics – AIDS, Ebola, West Nile, SARS, Lyme disease and hundreds more that have occurred over the last several decades – don't just happen. They are a result of things people do to nature.

Disease, it turns out, is largely an environmental issue. Sixty per cent of emerging infectious diseases that affect humans are zoonotic – they originate in animals. And more than two-thirds of those originate in wildlife.

Teams of veterinarians and conservation biologists are in the midst of a global effort with medical doctors and epidemiologists to understand

"Any emerging disease in the last 30 or 40 years has come about as a result of encroachment into wild lands and changes in demography"

PETER DASZAK,
DISEASE ECOLOGIST

the "ecology of disease." It is part of a project called Predict, which is financed by the U.S. Agency for International Development. Experts are trying to figure out, based on how people alter the landscape – with a new farm or road, for example – where the next diseases are likely to spill over into humans and how to spot them when they do emerge, before they can spread.

They are gathering blood, saliva and other samples from high-risk wildlife species to create a library of viruses so that, if one does infect humans, it can be more quickly identified. And they are studying ways of managing forests, wildlife and livestock to prevent diseases from leaving the woods and becoming the next pandemic.

It isn't only a public-health issue, but an economic one. The World Bank has estimated that a severe influenza pandemic, for example, could cost the world economy $3 trillion.

The problem is exacerbated by how livestock are kept in poor countries, which can magnify diseases borne by wild animals. A study released this month by the International Livestock Research Institute found that more than two million people a year are killed by diseases that spread to humans from wild and domestic animals.

bats. They are messy eaters, no small matter in this scenario. They often hang upside down, looking like Dracula wrapped tightly in their membranous wings, and eat fruit by chewing the pulp and then spitting out the juices and seeds.

The bats have evolved with henipah over millions of years, and because of this co-evolution, they experience little more from it than the fruit bat equivalent of a cold. But once the virus breaks out of the bats and into species that haven't evolved with it, a horror show can occur, as one did in 1999 in rural Malaysia. It is likely that a bat dropped a piece of chewed fruit into a piggery in a forest. The pigs became infected with the virus and amplified it, and it jumped to humans.

It was startling in its lethality. Out of 276 people infected in Malaysia, 106 died and many others suffered permanent neurological disorders. Since then there have been 12 smaller outbreaks in South Asia.

In Australia, where four people and dozens of horses have died of Hendra, the scenario was different: suburbanization lured infected bats that were once forest-dwellers into backyards and pastures.

If a henipah virus evolves to be transmitted readily through casual contact, the concern is that it could leave the jungle and spread throughout Asia or the world.

"Nipah is spilling over, and we are observing these small clusters of cases – and it's a matter of time that the right strain will come along and efficiently spread among people," says Jonathan Epstein, a veterinarian with EcoHealth Alliance, a New York-based organization that studies the ecological causes of disease.

That's why experts say it's critical to understand underlying causes. "Any emerging disease in the last 30 or 40 years has come about as a result of encroachment into wild lands and changes in demography," says Peter Daszak, a disease ecologist and the president of EcoHealth.

Emerging infectious diseases are either new types of pathogens or old ones that have mutated to become novel, as the flu does every year. AIDS, for example, crossed into humans from chimpanzees in the 1920s when bush-meat hunters in Africa killed and butchered them.

Diseases have always come out of the woods and wildlife and found their way into human populations – the plague and malaria are two examples.

But emerging diseases have quadrupled in the last half-century, experts say, largely because of increasing human encroachment into habitat, especially in disease "hot spots" around the globe, mostly in tropical regions. And with air travel and a robust market in wildlife trafficking, the potential for a serious outbreak in urban centres is enormous.

The key to forecasting and preventing the next pandemic, experts say, is understanding what they call the "protective effects" of nature intact.

In the Amazon, for example, one study showed an increase in deforestation by some four per cent increased the incidence of malaria by nearly 50 per cent because mosquitoes, which transmit the disease, thrive in the right mix of sunlight and water in recently deforested areas.

Developing the forest in the wrong way can be like opening Pandora's box. These are the

The robin plays a role in the spread of West Nile virus.

can cause disease. The West Nile virus arrived in the U.S. from Africa but spread because one of its favoured hosts is the American robin, which thrives in a world of lawns and agricultural fields. And mosquitoes, which spread the disease, find robins especially appealing.

"The virus has had an important impact on human health in the United States because it took advantage of species that do well around people," says Marm Kilpatrick, a biologist at the University of California, Santa Cruz. The pivotal role of the robin in West Nile has earned it the title "super spreader."

The best way to prevent the next outbreak in humans, specialists say, is with what they call the One Health Initiative,

Anthony, a molecular virologist at EcoHealth. "It's learning how to do things sustainably. If you can get a handle on what it is that drives the emergence of a disease, then you can learn to modify environments sustainably."

The scope of the problem is huge. Just an estimated one per cent of wildlife viruses are known. Another major factor is the immunology of wildlife, a science in its infancy.

Raina Plowright, a biologist at Pennsylvania State University who studies the ecology of disease, found that outbreaks of the Hendra virus in flying foxes in rural areas were rare but were much higher in urban and suburban animals.

"By mapping encroach-

may be riding on the work of Predict. EcoHealth and its partners – the University of California at Davis, the Wildlife Conservation Society, the Smithsonian Institution and Global Viral Forecasting – are looking at wildlife-borne viruses across the tropics, building a virus library. Most of the work focuses on primates, rats and bats, which are most likely to carry diseases that affect people.

Most critically, Predict researchers are watching the interface where deadly viruses are known to exist and where people are breaking open the forest, as they are along the new highway from the Atlantic to the Pacific across the Andes in Brazil and Peru.

potentially a risk.' "

It might mean talking to people about how they butcher and eat bush meat or to those who are building a feedlot in bat habitat.

In Bangladesh, where Nipah broke out several times, the disease was traced to bats that were raiding containers that collected date palm sap, which people drank. The disease source was eliminated by placing bamboo screens over the collectors.

EcoHealth also scans luggage at airports, looking for imported wildlife likely to be carrying deadly viruses. And it has a program called PetWatch to warn consumers about exotic pets that are pulled out of the

The Nipah virus in South Asia, and the closely related Hendra virus in Australia, both in the genus of henipah viruses, are the most urgent examples of how disrupting an ecosystem can cause disease. The viruses originated with flying foxes, Pteropus vampyrus, also known as fruit

Pandora's box. These are the kinds of connections the new teams are unravelling.

Public-health experts have begun to factor ecology into their models. Australia, for example, has just announced a multimillion-dollar effort to understand the ecology of the Hendra virus and bats.

It's not just the invasion of intact tropical landscapes that can the One Health Initiative. The worldwide program, involving more than 600 scientists and other professionals, advances the idea that human, animal and ecological health are inextricably linked and need to be studied and managed holistically.

"It's not about keeping pristine forest pristine and free of people," says Simon

She hypothesizes that urbanized bats are sedentary and miss the frequent exposure to the virus they used to get in the wild, which kept the infection at low levels. That means more bats — whether from poor nutrition, loss of habitat or other factors — become infected and shed more of the virus into backyards.

The fate of the next pandemic

ment into the forest you can predict where the next disease could emerge," Daszak, EcoHealth's president, says. "So we're going to the edge of villages, we're going to places where mines have just opened up, areas where new roads are being built. We are going to talk to people who live within these zones and saying, 'What you are doing is

forest in disease hot spots and shipped to market.

All in all, the knowledge gained in the last couple of years should allow us to sleep a little easier, says Epstein, the EcoHealth veterinarian. "For the first time, there is a co-ordinated effort in 20 countries to develop an early warning system for emerging zoonotic outbreaks."

Most pandemics—eg, HIV/AIDS, severe acute respiratory syndrome, pandemic influenza—originate in animals, are caused by viruses, and are driven to emerge by ecological, behavioural, or socioeconomic changes. Despite their substantial effects on global public health and growing understanding of the process by which they emerge, no pandemic has been predicted before infecting human beings. We review what is known about the pathogens that emerge, the hosts that they originate in, and the factors that drive their emergence. We discuss challenges to their control and new efforts to predict pandemics, target surveillance to the most crucial interfaces, and identify prevention strategies. New mathematical modelling, diagnostic, communications, and informatics technologies can identify and report hitherto unknown microbes in other species, and thus new risk assessment approaches are needed to identify microbes most likely to cause human disease. We lay out a series of research and surveillance opportunities and goals that could help to overcome these challenges and move the global pandemic strategy from response to pre-emption.

Introduction

The emergence of novel infectious diseases such as HIV/AIDS, severe acute respiratory syndrome (SARS), and pandemic influenza has shown the vulnerability of human beings to new zoonotic health threats. The mortality and morbidity associated with HIV/AIDS have devastated communities in some countries and led to global changes in public health. The rapid pandemic spread of SARS coronavirus in 2003 and a new triple-reassortant H1N1 influenza in 2009 both resulted in substantial economic loss as the pathogens exploited—and in some instances closed down—global travel and trade networks.[1] These vulnerabilities emphasise the need for a systematic, pre-emptive approach that aims to prevent the spread, or even the initial emergence, of pandemics.

The emergence of novel pandemic agents often seems to be inherently unpredictable.[2] Indeed, no pathogens have been predicted before their first appearance. However, patterns in the origins and spread of new pathogens can be noted and are an intrinsic, albeit ad-hoc, part of surveillance strategy. For example, more than 60% of the roughly 400 emerging infectious diseases that have been identified since 1940 are zoonotic,[3] and these pathogens are the focus of particular public health interest.[4,5] Similarly, specific geographical regions or interfaces between people, wildlife, livestock, and the environment have been identified as the origins of recent emerging infectious diseases, and thus are targets for intense surveillance.[3,5–7] Analysis of previous emergence events has led to a better understanding of the causes (so-called drivers) of emergence.[4,8] These advances, coupled with a better understanding of the dynamics of pathogen transmission, ecology, and evolution as they emerge and spread, promise the possibility to predict pandemics. Here we review these findings and the most promising strategies to improve anticipation, prediction, and pre-emption of the next pandemic zoonosis at the source.

Key messages

- Most recent pandemics, such as HIV/AIDS, severe acute respiratory syndrome, and pandemic influenza, are caused by zoonotic pathogens (ie, pathogens harboured by non-human animals), are viral diseases, and originated in wildlife
- Such infections are usually driven to emerge by ecological, behavioural, or socioeconomic changes
- Technological advances in mathematical modelling, diagnostics, communication, and informatics enable targeted global surveillance of emerging and previously unknown infections in both human beings and other species
- New risk-assessment approaches show promise for the use of these capabilities to predict and pre-empt potential pandemics at their source (eg, in wildlife or other animals), and need to be further developed

Search strategy and selection criteria

We searched PubMed and ISI Web of Knowledge with the terms "emerging infectio*", "zoonos*", or "pathogen discovery" in combination with the terms "modeling", "prediction", "surveillance", "evolution", "ecology", or "methodology" for papers published in any language before Sept 25, 2012. We did our searches when we began to develop and write the paper and again before submission of the revised, final version. Some coauthors provided references that they deemed of particular importance. We largely selected publications from the past 5 years, but did not exclude commonly referenced and highly regarded older publications. We also searched the reference lists of articles identified by our searches and selected those judged relevant. Reviews and book chapters are cited to provide readers with more detailed information and references than is possible in the space allowed. Our reference list was modified on the basis of comments from peer reviewers.

Page 01 of 09 - [HW005R][GDrive]

Origins and dynamics of pandemic zoonoses

When the origins of emerging infectious diseases are traced back to first emergence in the human population, some distinctive patterns are revealed that could be used in disease control.[3,6] First, the frequency with which new pathogens emerge is increasing, even when the increased surveillance globally is taken into account,[3] suggesting that efforts to coordinate the global strategy to fight pandemics are timely and of growing importance.[5,9] Second, the emergence of all major groups of emerging infectious diseases correlates strongly with human population density, supporting the hypothesis that disease emergence is driven by largely anthropogenic changes, such as the expansion of agriculture, travel routes, and trade, and changes in land use.[10] Finally, the emergence of zoonotic pathogens of wildlife origin (which have dominated the pandemics of the past 100 years) correlates strongly with both human density and the global distribution of wildlife biodiversity.[3,8] Spatially explicit models can be used to identify the regions most likely to produce the next emerging zoonoses (so-called hotspots of emerging infectious disease).[3] These hotspots are regions where human activities take place against a background of high wildlife biodiversity, with concomitant microbial biodiversity (figure 1). Targeting of surveillance to such regions provides a rationale for better allocation of global resources to prevent emerging infectious disease or rapidly deal with outbreaks.[3]

The process through which pandemic zoonoses emerge can be analysed to identify the crucial control points and specific research challenges (panel 1, figure 2). The model we adopt here (developed by Daszak) to assess pandemic potential has three stages—no human infection (stage 1), localised human infection (spillover; stage 2), and widespread transmission and global dissemination (stage 3). The frequency at which stages 1 and 2 occur is unknown but probably high. That human populations are continually exposed to a wide variety of non-human-animal pathogens, many of which infect human beings, seems reasonable to assume. To assess the role of pathogen biology in emergence, investigators need to know how many pathogens people are exposed to and how many successfully cross the species barrier. A complete inventory of spillovers is not available, but researchers have a good working knowledge of pathogens of domestic livestock and pets (species in frequent contact with human beings). Almost 50% of the roughly 1000 species of pathogens that are noted in livestock and pets are zoonotic,[7] implying that any barriers between these hosts and human beings are routinely breached by many different pathogens. More than 50% of the recognised pathogens of human beings can infect other vertebrate hosts.[8] Many non-human pathogens can infect several hosts, and clear examples of viruses transferring between different animal hosts to cause outbreaks in other species have been

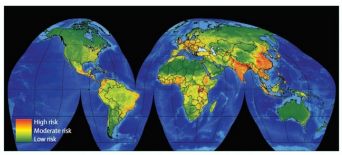

Figure 1: Global hotspots for emerging infectious diseases that originate in wildlife
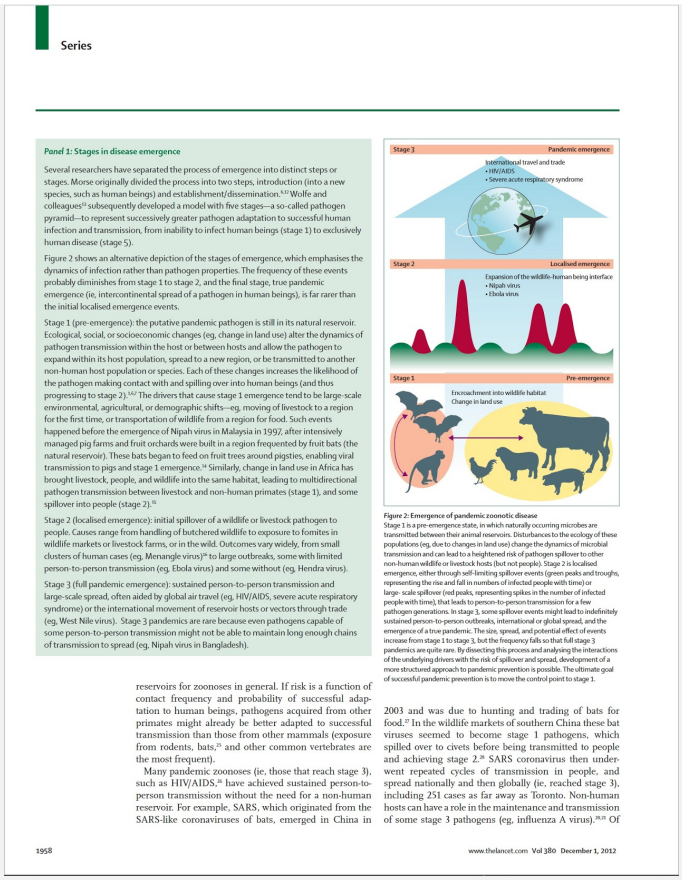
A database of all known emerging infectious diseases' since 1940 was used to identify the most likely origins of each separate emergence event. Presence or absence of infections emerging from wildlife was analysed with logistic regression against a series of known drivers, including human population density, change in human population density, and wildlife diversity (mammalian species richness), gridded at 1 km² resolution. The global distribution of model outputs gives a measure of the likelihood of a region to generate a new zoonotic emerging infectious disease that originates in wildlife. Because previous pandemics have mainly originated in wildlife, these maps identify hotspots where the next pandemic is most likely to originate.

reported.[17,18] Pathogens can transfer from human beings to animals and between different animal species before being transferred back to people, allowing remixing and evolution with spill-back and potentially enhanced pathogenicity (eg, influenza).[18,19]

Human pathogens from all taxa contain zoonotic species. Roughly 80% of viruses, 50% of bacteria, 40% of fungi, 70% of protozoa, and 95% of helminths that infect human beings are zoonotic.[8] Most of the identified reservoirs are mammalian (roughly 80%) or, to a lesser extent, avian,[8,12] although people share some pathogens with invertebrates, which act as vectors[13] or intermediate hosts. Identification of the key taxonomic groups that are sources for the emergence of zoonotic disease could help to improve targeting of surveillance and interventions. Ungulates are the mammalian taxa with which human beings share the most pathogens[8]—perhaps not surprising because, as major food sources, these animals are often in close proximity to people, and their diseases have been studied extensively. Rodents, carnivores, and primates are also well represented. Although pathogens deemed emerging or re-emerging are disproportionately likely to be zoonotic,[14] their reservoirs are much the same as those of non-emerging zoonoses.[15]

The situation, however, is substantially different for pathogens that have reached stage 3. A disproportionate number of these pathogens are viruses, suggesting that viruses have the potential to evolve more rapidly than do other kinds of pathogen. However, this finding could be due to ascertainment bias. Less complete knowledge is available about the diversity of viruses than that of other pathogens, and researchers might still be missing many at stages 1 and 2.[16] Although a lot of stage 3 pathogens that infect only people don't strictly have reservoirs (eg, HIV-1), many are thought to have had zoonotic origins, including in non-human primates, which contrasts strongly with the minor contribution of primates as

Page 02 of 09 - [HW005S][GDrive]



Series

Panel 1: Stages in disease emergence

Several researchers have separated the process of emergence into distinct steps or stages. Morse originally divided the process into two steps, introduction (into a new species, such as human beings) and establishment/dissemination.[4,5] Wolfe and colleagues[14] subsequently developed a model with five stages—a so-called pathogen pyramid—to represent successively greater pathogen adaptation to successful human infection and transmission, from inability to infect human beings (stage 1) to exclusively human disease (stage 5).

Figure 2 shows an alternative depiction of the stages of emergence, which emphasises the dynamics of infection rather than pathogen properties. The frequency of these events probably diminishes from stage 1 to stage 2, and the final stage, true pandemic emergence (ie, intercontinental spread of a pathogen in human beings), is far rarer than the initial localised emergence events.

Stage 1 (pre-emergence): the putative pandemic pathogen is still in its natural reservoir. Ecological, social, or socioeconomic changes (eg, change in land use) alter the dynamics of pathogen transmission within the host or between hosts and allow the pathogen to expand within its host population, spread to a new region, or be transmitted to another non-human host population or species. Each of these changes increases the likelihood of the pathogen making contact with and spilling over into human beings (and thus progressing to stage 2).[3,6,7] The drivers that cause stage 1 emergence tend to be large-scale environmental, agricultural, or demographic shifts—eg, moving of livestock to a region for the first time, or transportation of wildlife from a region for food. Such events happened before the emergence of Nipah virus in Malaysia in 1997, after intensively managed pig farms and fruit orchards were built in a region frequented by fruit bats (the natural reservoir). These bats began to feed on fruit trees around pigsties, enabling viral transmission to pigs and stage 1 emergence.[14] Similarly, change in land use in Africa has brought livestock, people, and wildlife into the same habitat, leading to multidirectional pathogen transmission between livestock and non-human primates (stage 1), and some spillover into people (stage 2).[15]

Stage 2 (localised emergence): initial spillover of a wildlife or livestock pathogen to people. Causes range from handling of butchered wildlife to exposure to fomites in wildlife markets or livestock farms, or in the wild. Outcomes vary widely, from small clusters of human cases (eg, Menangle virus)[16] to large outbreaks, some with limited person-to-person transmission (eg, Ebola virus) and some without (eg, Hendra virus).

Stage 3 (full pandemic emergence): sustained person-to-person transmission and large-scale spread, often aided by global air travel (eg, HIV/AIDS, severe acute respiratory syndrome) or the international movement of reservoir hosts or vectors through trade (eg, West Nile virus). Stage 3 pandemics are rare because even pathogens capable of some person-to-person transmission might not be able to maintain long enough chains of transmission to spread (eg, Nipah virus in Bangladesh).

Figure 2: **Emergence of pandemic zoonotic disease**
Stage 1 is a pre-emergence state, in which naturally occurring microbes are transmitted between their animal reservoirs. Disturbances to the ecology of these populations (eg, due to changes in land use) change the dynamics of microbial transmission and can lead to a heightened risk of pathogen spillover to other non-human wildlife or livestock hosts (but not people). Stage 2 is localised emergence, either through self-limiting spillover events (green peaks and troughs, representing the rise and fall in numbers of infected people with time) or large- scale spillover (red peaks, representing spikes in the number of infected people with time), that leads to person-to-person transmission for a few pathogen generations. In stage 3, some spillover events might lead to indefinitely sustained person-to-person outbreaks, international or global spread, and the emergence of a true pandemic. The size, spread, and potential effect of events increase from stage 1 to stage 3, but the frequency falls so that full stage 3 pandemics are quite rare. By dissecting this process and analysing the interactions of the underlying drivers with the risk of spillover and spread, development of a more structured approach to pandemic prevention is possible. The ultimate goal of successful pandemic prevention is to move the control point to stage 1.

reservoirs for zoonoses in general. If risk is a function of contact frequency and probability of successful adaptation to human beings, pathogens acquired from other primates might already be better adapted to successful transmission than those from other mammals (exposure from rodents, bats,[25] and other common vertebrates are the most frequent).

Many pandemic zoonoses (ie, those that reach stage 3), such as HIV/AIDS,[26] have achieved sustained person-to-person transmission without the need for a non-human reservoir. For example, SARS, which originated from the SARS-like coronaviruses of bats, emerged in China in 2003 and was due to hunting and trading of bats for food.[27] In the wildlife markets of southern China these bat viruses seemed to become stage 1 pathogens, which spilled over to civets before being transmitted to people and achieving stage 2.[28] SARS coronavirus then underwent repeated cycles of transmission in people, and spread nationally and then globally (ie, reached stage 3), including 251 cases as far away as Toronto. Non-human hosts can have a role in the maintenance and transmission of some stage 3 pathogens (eg, influenza A virus).[29,30] Of

Series

the 400 or so known emerging pathogens, roughly 100 occur only as human pathogens—ie, such specialisation is rare.[29] Some of the seemingly specialist human pathogens are thought to have had zoonotic origins much further back in evolutionary time (eg, *Plasmodium falciparum*).[30] This pattern could be the norm, but the origins of most specialist human pathogens are unknown.[31] Much more is known about the dynamics of pandemic pathogens once they can be transmitted among people. Transmission rates are often higher in dense than in sparse populations, and spread is often greatly enhanced by air travel or human migration. The mathematics of these spreading events is well known, and a sophisticated array of computational models have been used to back-predict such events accurately—eg, the first case clusters of SARS[32] and the subsequent global spread, including the country-by-country distribution of human cases.[33] Models based on air travel, realistic contact networks, and individual countries' capacities to deal with outbreaks can now produce reasonably accurate predictions of future pandemic spread (particularly for influenza).[33–35] However, less is known about the factors that enable pathogens to move from stage 2 to stage 3 and ultimately achieve pandemic status. During this process, stuttering chains of novel human transmission (as with human monkeypox in Africa, for example[36,37]) can become self-sustaining (which monkeypox has still not achieved in people[36]). The distribution and behaviour of human beings, reservoir hosts, and vectors are crucial for emergence, and human demographics and behaviour often establish capacity for person-to-person transmission.

Differential host physiology, especially age and immunocompetence, affect susceptibility to infection.[38,39] The surge in immunocompromised patients during the HIV/AIDS pandemic was associated with an upsurge in other emerging pathogens.[39] Host factors often receive less research focus than does pathogen virulence, but improved knowledge of host responses is essential to understand the species barrier and why some zoonotic pathogens are benign in their natural hosts but lethal when introduced to other species.[38,39]

In view of the importance of human activities in emergence, integration of social sciences research—particularly that focused on human behaviour and demographics—into models of infectious disease emergence and evolution is essential to understand pandemics.[40,41] The importance of human exposure throughout the emergence process also suggests that simple behavioural precautions could greatly reduce risk. Risks to hunters, food handlers, and livestock workers from occupational exposure could be reduced in hotspots of emerging infectious diseases though routine sanitation and biosafety precautions, as has been tried with H5N1 in agricultural settings.[42] Nosocomial spread could be prevented by stringent adherence to infection control practices—eg, use of sterile injection equipment.

A successful pathogen needs to possess the molecular machinery to infect people, invade human cells or tissues, replicate, and access tissues from which it can exit the host and transmit (directly or indirectly) to other people.[40,41] Historical examples are few, and thus to quantify the relative contribution of exposure frequency versus phylogenetic relatedness to the risk of successful infection is difficult. Analysis of host–pathogen databases of primates shows that closely related sympatric host species are more likely to share parasite species than are distantly related sympatric host species.[43] Although any pathogen from a mammalian (or avian) host is a potential threat, that exposure of people to novel pathogens from our closest animal relatives poses the greater risk to public health is at least plausible.

Microbes often evolve substantially during emergence (eg, SIVcpz evolved into HIV-1), and the role of evolutionary adaptation in enabling pathogen establishment in human populations is a subject of active research.[45,46] Alternatively, some pathogens can spread between human beings without evolutionary change from the genotypes present in the wildlife host (eg, Ebola virus), and thus can enter the human population at stage 2. Phylodynamics, which combines a modelling framework for host, epidemiological, and molecular data,[47,48] especially for RNA viruses, shows particular promise for understanding of patterns of viral evolution during epidemics.[48,49]

Testing of the relative importance of exposure and host relatedness in stage 2 emergence is an important challenge. For plant pathogens, experimental infection of closely or distantly related plants with a range of fungal pathogens has shown that host relatedness is a key factor in the ability of a pathogen to infect a novel host.[50] Such a study would be logistically and ethically challenging in mammals, but experimental work with several model systems and various other organisms is underway, and systematic studies of host–parasite databases might provide an alternative. These studies might provide new surveillance opportunities by allowing improved targeting of the key wildlife species most likely to harbour the next emerging zoonosis.

Pathogen discovery

Identification of zoonotic pathogens has been substantially improved by advances in molecular diagnostics, which make possible the identification of hitherto unknown pathogens in nature (so-called pathogen discovery).[51,52] This process also includes differential diagnosis of infectious disease and surveillance for known or novel microbes that are normally benign in natural hosts but have the potential to become pathogenic in other hosts. Traditionally, microbe hunters used many techniques, including in-vitro and in-vivo culture, immunohistochemistry, electron microscopy, and serology. Immunohistochemistry of clinical samples was used successfully in several cases. Molecular techniques were

2013 (May 27) - NYTimes : "New Tools to Hunt New Viruses"

A man in Saudi Arabia wore a mask last week to protect against a virus that has killed 22 since it was found there last year.

By Donald G. McNeil Jr. / [HN01HT][GDrive]

A new flu, H7N9, has killed 36 people since it was first found in China two months ago. A new virus from the SARS family has killed 22 people since it was found on the Arabian Peninsula last summer.

In past years, this might have been occasion for panic. Yet chicken and pork sales have not plummeted, as they did during flus linked to swine and birds. Travel to Shanghai or Mecca has not been curtailed, nor have there been alarmist calls to close national borders.

Is this relatively calm response in order? Or does the simultaneous emergence of two new diseases suggest something more dire?

Actually, experts say, the answer to both questions may well be yes.

"We've done a great job globally in the last 10 years," said [**Dr. William Bamberger Karesh (born1955)**], a wildlife veterinarian and chief of health policy for the EcoHealth Alliance, which tracks animal-human outbreaks. "Compared to H5N1 and SARS, we're getting on top of these diseases much, much faster."

But he added that "people have become desensitized over time — it's 'Oh, O.K., another one.' "

And scientists say the world cannot afford to relax. The threat is real. New diseases are emerging faster than ever.

Peter Daszak, a parasitologist and president of the EcoHealth Alliance, has even put a number on it: 5.3 new ones each year, based on a study using data from 1940 to 2004. He and his co-authors blamed population growth, deforestation, antibiotic overuse, factory farming, live animal markets, bush meat hunting, jet travel and other factors.

Some aspects of the new viruses are scary. The Arabian coronavirus — now officially named MERS, for Middle East respiratory syndrome — has killed about half of those it infects, while SARS killed less than a quarter; in the lab, it replicates faster than SARS, penetrates lung cells more readily and inhibits the formation of proteins that warn the body that it is under attack.

In her closing remarks on Monday at the annual meeting of the world's health ministers, Dr. Margaret Chan, director-general of the World Health Organization, said the virus was now her "greatest concern."

Until experts figure out where it hides and how it infects humans, "we are empty-handed when it comes to prevention," she said. "These are alarm bells, and we must respond."

The H7N9 flu has been fatal in a quarter of known cases — the 1918 Spanish flu killed only 2 percent of its victims — and already has one dangerous mutation that helps it replicate at human body temperatures.

Still, better surveillance means that such threats are being caught sooner, giving time to develop countermeasures like vaccines and making it far less likely

that a virus like the 1918 flu will ever again kill millions.

It also means that outbreaks that once might have faded away unnoticed now set off alarms, for better and for worse. Fifty years ago, even the dreaded H5N1 bird flu, which emerged in 2003 and kills about half its victims, might have been missed. It makes the jump to humans so rarely that even now it is basically a poultry problem: It has killed millions of chickens and occasional flocks of wild birds, but in a whole decade has claimed only 364 human lives, and that is known only because it can be distinguished from other flus by genetic typing.

The world's ability to detect new diseases has sped up for reasons both technical and political.

First, rapid gene sequencing is now done in many laboratories.

Second, accurate symptom descriptions are instantly available. Web-based news services like ProMED, with scientist-members all over the world, issue several daily reports of outbreaks of everything from banana wilt to sheep bluetongue to human Ebola. Also, genetic sequences of new viruses are often posted on public databases, so their travels can be tracked. Scientists learned, for example, that a 2008 convention of Roman Catholic youth in Sydney, Australia, drew in influenza strains that then seeded new outbreaks all over the Northern Hemisphere.

Image

An image of a coronavirus, part of a family that causes the common cold and SARS. A new strain, called MERS, for Middle East respiratory syndrome, has been particularly lethal, killing half those infected.

Credit...

Uncredited/Health Protection Agency, via Associated Press

Third, and very important, countries that used to hide their outbreaks now admit them. It would be virtually impossible now, for example, to repeat what happened in Africa in the 1980s, when presidents insisted for years that no one in their countries had AIDS.

The paragon of the new transparency cited most often is China. In 2003, it was excoriated for covering up its SARS outbreak. It later dismissed many of the officials involved. Now, with H7N9, "they're being forthright and they're also right at the forefront of research," said Dr. W. Ian Lipkin, a microbe hunter at the Mailman School of Public Health at Columbia University, who just opened a partner laboratory at China's Centers for Disease Control.

Saudi Arabia suffered a similar embarrassment in 2005, when it reacted slowly to polio spreading toward Mecca with pilgrims from northern Nigeria. Cases of paralysis ultimately reached the hills outside Mecca and from there spread briefly as far as Indonesia. Saudi Arabia now gives polio vaccines to millions of pilgrims on arrival.

Covering up an outbreak is now a violation of World Health Organization regulations adopted in the wake of SARS. The rules require members to disclose any public health event that could spread beyond their borders.

Both H7N9 and MERS fit that description. Neither is easily transmissible, though both have almost undoubtedly infected family members, nurses or hospital roommates after long exposure. Most deaths from both have been in older patients with other health problems.

More worrisome is that no one knows how these viruses first infect victims.

H7N9 is avian, a mix of genes from domestic chickens and wild waterfowl. But many Chinese H7N9 patients have had no known bird contact, and the disease has been found only rarely in birds. Unlike H5N1, it does not wipe out flocks, so it is hard to hunt. Its spread pattern is roughly circular around Shanghai, suggesting it is mostly in poultry, not migratory birds. That could change if it starts traveling in wild ducks. (Rice farmers have duck farmers drive flocks into paddies to eat the snails that eat rice shoots, and wild ducks mix with them there.)

A decade ago, H5N1 also started in China but spread west in a zigzag pattern as wild waterfowl shared Mongolian lakes in summer with species that went southwest to Eastern Europe, Egypt and Africa and were caught in storms that blew them as far as Britain.

The origins of MERS are even more baffling. Scientists assume it is from bats, because it is genetically closer to coronaviruses found in them than to SARS or to the four known human coronaviruses, which cause common colds. But while bats in Mexico, Europe and Africa have similar viruses, none have yet been found in Arabian bats or in camels, goats or other animals that might transfer it to humans.

Dr. Daszak cited Nipah virus as an example of how humans get bat diseases. It was the inspiration for the 2011 movie "Contagion," in which Gwyneth Paltrow had vivid death and autopsy scenes. Bat feces landed on fruit eaten by pigs, and Ms. Paltrow's character was infected when she shook the unwashed hand of a casino chef who had just cleaned out a dead pig's mouth. (In the first real-life Nipah outbreak, in Malaysia in 1999, most victims were pig farmers and butchers.)

But another study, done in Bangladesh by a colleague of Dr. Daszak, showed that humans get Nipah directly from bats by drinking fresh date palm sap. Sap-drinking bats crawled into the collecting jugs hung in trees, drooling and urinating in them.

Small numbers of sap drinkers may have died of Nipah for decades without it being noticed, Dr. Daszak said.

Right now, doctors are relying on isolating patients and antiviral treatment with oseltamivir and zanamivir for H7N9, and ribavirin and interferon for MERS.

If either virus goes epidemic, the next step would be vaccine.

The Centers for Disease Control and Prevention began making one against H7N9 in early April. The first of several candidates may be ready for manufacturers by the end of May, a spokeswoman said. How long it then would take to make and package millions of doses is unpredictable, she said, but should take at least six additional months.

Any vaccine for MERS will take much longer, said Mark A. Pallansch, director of the C.D.C.'s viral disease division. While flu vaccines have been produced around the world for 60 years, the passion for a coronavirus vaccine has faded since the SARS epidemic. Until recently, the most interested parties were poultry farmers, since one coronavirus kills turkeys.

Coronaviruses are unusually complex, so finding potential vaccine targets has been hard, and the extensive safety testing is expensive. Also, an animal model for testing was only recently found — macaque monkeys, in which the virus causes pneumonia.

2013 (July 01) - NYTimes : Solving a Viral Mystery"

A field team from EcoHealth Alliance, Columbia, and the Saudi Health Ministry examined a room taken over by bats in an abandoned village. They took samples for testing for the coronavirus causing Middle East respiratory syndrome.

By Denise Grady / [HN01HS][GDrive]

As the scientists peered into the darkness, their headlamps revealed an eerie sight. Hundreds of eyes glinted back at them from the walls and ceiling. They had discovered, in a crumbling, long-abandoned village half-buried in sand near a remote town in southwestern Saudi Arabia, a roosting spot for bats.

It was an ideal place to set up traps.

The search for bats is part of an investigation into a deadly new viral disease that has drawn scientists from around the world to Saudi Arabia. The virus, first detected there last year, is known to have infected at least 77 people, killing 40 of them, in eight countries. The illness, called MERS, for Middle Eastern respiratory syndrome, is caused by a coronavirus, a relative of the virus that caused SARS (severe acute respiratory syndrome), which originated in China and caused an international outbreak in 2003 that infected at least 8,000 people and killed nearly 800.

As the case count climbs, critical questions about MERS remain unanswered. Scientists do not know where it came from, where the virus exists in nature, why it has appeared now, how people are being exposed to it, or whether it is becoming more contagious and could erupt into a much larger outbreak, as SARS did. The disease almost certainly originated with one or more people contracting the virus from animals — probably bats — but scientists do not know how many times that kind of spillover to humans has occurred, or how likely it is to keep happening.

There is urgency to the hunt for answers. Half the known cases have been fatal, though the real death rate is probably lower, because there almost certainly have been mild cases that have gone undetected. But the virus still worries health experts, because it can cause such severe disease and has shown an alarming ability to spread among patients in a hospital. It causes flulike symptoms that can progress to severe pneumonia.

The disease is a chilling example of what health experts call emerging infections, caused by viruses or other organisms that suddenly find their way into humans. Many of those diseases are “zoonotic,” meaning they are normally harbored by animals but somehow manage to jump species.

“As the population continues to grow, we’re bumping up against wildlife, and they happen to carry some nasty viruses we’ve never seen before,” said Peter Daszak, a disease ecologist and the president of EcoHealth Alliance, a scientific group that studies links between human health, the health of wild and domestic animals, and the environment.

Saudi Arabia has had the most patients so far (62), but cases have also originated in Jordan, Qatar and the United Arab Emirates. Travelers from the Arabian peninsula have taken the disease to Britain, France, Italy and Tunisia, and have infected a few people in those countries. Health experts are also worried about the Hajj, the Muslim pilgrimage that will draw millions of visitors to Saudi Arabia in October.

MERS has not reached the United States, but health officials have told doctors to be on the lookout for patients who get sick soon after visiting the Middle East. So far, more than 40 people in 20 states have been tested, all with negative results, according to Dr. Anne Schuchat, the director of the National Center for Immunizations and Respiratory Diseases at the Centers for Disease Control and Prevention.

The illness can be spread by coughs and sneezes, or contaminated surfaces, and people with chronic diseases seem especially vulnerable. More men than women have fallen ill, possibly because women have been protected by their veils. A cluster of cases that began in a Saudi hospital in April ultimately involved 23 people, including several family members and health workers. One man infected seven people, each of whom spread the disease to at least one other person.

Image

Credit...

National Institute of Allergy and Infections Diseases - Rocky Mo, via Associated Press

Regardless of where they emerge, new illnesses are just “a plane ride away,” said Dr. Thomas Frieden, the director of the C.D.C.

And while MERS is not highly contagious like the flu, he said, “the likelihood of spread is not small.”

Ailing Patients Most Vulnerable

In May, Saudi health officials asked an international team of doctors to help investigate the hospital cluster. One concern was that a number of cases were in patients at a dialysis clinic, and doctors feared that dialysis machines or solutions might be spreading the disease.

“It was pretty easy to figure out that couldn’t have been the case,” said a member of the team, Dr. Connie S. Price, the chief of infectious diseases at Denver Health Medical Center.

The patients’ records did not point to dialysis as the culprit, she said, and there were clear cases of transmission in other parts of the hospital that had no connection to dialysis.

Why, then, the outbreak among dialysis patients? The answer seems to be that they were older, chronically ill and often diabetic; diabetes can suppress the immune system’s ability to fight off infections. So, when one dialysis patient contracted MERS, others who happened to be in the clinic at the same were easy targets for the virus.

“Introducing it into a dialysis center gives it the perfect environment to spread among vulnerable patients sitting in open bays for many hours,” Dr. Price said.

Some health experts have suggested that MERS, like SARS, may fade away. The SARS outbreak erupted in early 2003, but ended by that summer. Much of the success was attributed to infection control in hospitals and also to eliminating animals like civet cats, which were thought to have caught the virus from bats and to be infecting people in markets where the civets were being sold live to be killed and eaten.

But Dr. Allison McGeer, a microbiologist and infectious disease specialist at Mount Sinai Hospital in Toronto who is also part of the team that studied the Saudi hospital outbreak, said there were no signs that MERS was going away.

“Absolutely not,” she said. “There are ongoing cases of disease acquired in the community. The first we know about is April 2012 in Jordan. There has been a steady and continuing number of cases.”

Image

J.H. Epstein/EcoHealth Alliance

The fact that the disease has apparently emerged in geographically disparate places, with widely scattered cases in four Middle Eastern countries, also makes Dr. McGeer doubt that it is simply going to fizzle out.

Finding out where in the environment the disease is coming from might make it possible to tell people how to avoid it. Bats are the leading suspect, because they are a reservoir of SARS and carry other coronaviruses with genetic similarities to the MERS virus. Bats could be transmitting the disease directly to people, or they might be spreading it to some other animal that then infects humans. But what kind of bat? There are 1,200 species; 20 to 30 have been identified in Saudi Arabia.

Last October, to test the theory, a team of scientists from the Saudi Ministry of Health, Columbia University and EcoHealth Alliance began scouring Saudi towns near where cases of MERS had been reported, showing people pictures of bats and asking if they had seen any. They struck pay dirt when one man led them to an abandoned village in the southwest, said to be hundreds of years old. It was there, in the inky darkness, that they found a small room that had become the roost of about 500 bats.

The scientists set up nets to catch them when they flew out at dusk to hunt insects, then spent the night testing them for the MERS virus. The bats were let go after the testing.

The animals can weigh as little as four grams (one-seventh of an ounce), and a bat that size may have an eight-inch wingspan.

“They’re mostly wing,” said Kevin J. Olival, a disease ecologist with EcoHealth Alliance. “They’re little flying fur balls.”

It takes about 15 minutes to process a bat — to weigh and measure it, swab it for saliva and feces samples, and collect some blood and a tiny plug of skin from a wing for DNA testing to confirm its species. The specimens were then frozen and sent to the laboratory of Dr. W. Ian Lipkin, a leading expert on viruses at Columbia.

Bats do not much appreciate all this medical attention. They bite, and in addition to potentially carrying MERS, they may harbor rabies and other viruses.

“You’re wearing coveralls that cover everything — hoods, gloves, respirators, booties,” Dr. Lipkin said. “You’re all dressed, so you don’t have any contact with the animals. It’s night, but still very hot.”

Hundreds of bats have been tested, he said, but it is too soon to disclose the results.

From Animals to Humans

Image

Credit...

V. Kapoor/Columbia University

The team has also tested camels, goats, sheep and cats, which might act as intermediate hosts, picking up the virus from bats and then infecting people. One reason for suspecting camels is that a MERS patient from the United Arab Emirates had been around a sick camel shortly before falling ill. But that animal was not tested.

“If animals are acting as a reservoir, getting people sick, how would this happen?” asked Dr. Jonathan H. Epstein, a veterinary epidemiologist with EcoHealth Alliance.

If animals harbor the virus, does it make them ill? Do they infect people by coughing? Or do they pass the virus in urine or feces, and infect people who clean their stalls? The answers do not come easily.

“Camels are tough, let me tell you,” said Dr. Epstein. “They’re ornery. It takes a certain kind of person to be able to wrangle a camel. They’re strong, they’re fast, they bite really hard.”

The trick, he said, is to get the camel into a position that veterinarians call “ventral recumbency,” or lying on its belly. A very feisty camel may also have its legs tied together so it cannot run away or kick anybody. Then someone steadies its head, maybe with a harness, and holds its jaws open so a vet can reach in and out quickly with a cotton swab.

“They have a pretty big mouth,” Dr. Epstein said. “You try not to get bitten.”

So far, he said, “none of the animals we looked at were overtly sick.”

But Dr. Lipkin noted that the virus tests on livestock samples were not complete. Any specimens from such animals from other countries are considered a

threat to agriculture in the United States because they could carry foot-and-mouth disease or other pathogens, and have to be screened first by the Agriculture Department before being released to research labs.

Testing may identify animal species that carry the virus, but that will not immediately explain why it has emerged now.

“The most common reason that wildlife viruses make the jump into people is that we do things that bring us and our livestock into closer contact with wildlife, such as the wildlife trade or agricultural intensification,” Dr. Epstein said.

And, said his colleague Dr. Olival, finding the animals that carry the disease is “not just an academic exercise.”

“It’s a way to inform public health measures,” he said, “to try to stop zoonotic diseases before they emerge into humans.”

Bats may hold key to deadly outbreak

By DENISE GRADY
New York Times News Service

As the scientists peered into the darkness, their headlamps revealed an eerie sight. Hundreds of eyes glinted back at them from the walls and ceiling. They had discovered, in a crumbling, long-abandoned village half-buried in sand near a remote town in southwestern Saudi Arabia, a roosting spot for bats.

Regardless of where they emerge, new illnesses are just "a plane ride away," said Dr. Thomas Frieden, the director of the CDC.

And while MERS is not highly contagious like the flu, he said, "the likelihood of spread is not small."

THE MOST VULNERABLE

In May, Saudi health officials asked an international team of doctors to help investigate the hospital cluster. One concern was that a number of cases were in patients at a dialysis clinic, and doctors feared that dialysis machines or solutions might be spreading the disease.

"It was pretty easy to figure out that couldn't have been the case," said a member of the team, Dr. Connie S. Price, the chief of infectious diseases at Denver Health Medical Center.

The patients' records did not point to dialysis as the culprit, she said, and there were clear cases of transmission in other parts of the hospital that had no connection to dialysis.

Why, then, the outbreak among dialysis patients? The answer seems to be that they were older, chronically ill and often diabetic; diabetes can suppress the immune system's ability to fight off infections.

So, when one dialysis patient contracted MERS, others who happened to be in the clinic at the same were easy targets for the virus.

"Introducing it into a dialysis center gives it the perfect environment to spread among vulnerable patients sitting in open bays for many hours," Price said.

Finding out where in the environment the disease is coming from might make it possible to tell people how to avoid it. Bats are the leading suspect, because they are a reservoir of SARS and carry other coronaviruses with genetic similarities to the MERS virus. Bats could be transmitting the disease directly to people, or they might be spreading it to some other animal that then infects humans. But what kind of bat? There are 1,200 species; 20 to 30 have been identified in Saudi Arabia.

Last October, to test the theory, a team of scientists from the Saudi Ministry of Health, Columbia University and EcoHealth Alliance began scouring Saudi towns near where cases of MERS had been reported, showing people pictures of bats and asking if they had seen any. They struck pay dirt when one man led them to an abandoned village in the southwest, said to be hundreds of years old. It was there, in the inky darkness, that they found a small room that had become the roost of about 500 bats.

The scientists set up nets to catch them when they flew out at dusk to hunt insects, then spent the night testing them for the MERS virus. The bats were let go after the testing.

The animals can weigh as little as 4 grams (one-seventh of an ounce), and a bat that size may have an eight-inch wingspan.

"They're mostly wing," said Kevin J. Olival, a disease ecologist with EcoHealth Alliance. "They're little flying fur balls."

It takes about 15 minutes to process a bat — to weigh and measure it, swab it for saliva and feces samples, and collect some blood and a tiny plug of skin from a wing for DNA testing to confirm its species. The specimens were then frozen and sent to the laboratory of Dr. W. Ian Lipkin, a leading expert on viruses at Columbia.

Hundreds of bats have been tested, he said, but it is too soon to disclose the results.

ANIMALS TO HUMANS

The team has also tested camels, goats, sheep and cats, which might act as intermediate hosts, picking up the virus from bats and then infecting people. One reason for suspecting camels is that a MERS patient from the United Arab Emirates had been around a sick camel shortly before falling ill. But that animal was not tested.

"If animals are acting as a reservoir, getting people sick, how would this happen?" asked Dr. Jonathan H. Epstein, a veterinary epidemiologist with EcoHealth Alliance.

If animals harbor the virus, does it make them ill? Do they infect people by coughing? Or do they pass the virus in urine or feces, and infect people who clean their stalls? The answers do not come easily.

So far, he said, "none of the animals we looked at were overtly sick."

But Lipkin noted that the virus tests on livestock samples were not complete. Any specimens from such animals from other countries are considered a threat to agriculture in the United States because they could carry foot-and-mouth disease or other pathogens, and have to be screened first by the Agriculture Department before being released to research labs.

Testing may identify animal species that carry the virus, but that will not immediately explain why it has emerged now.

"The most common reason that wildlife viruses make the jump into people is that we do things that bring us and our livestock into closer contact with wildlife, such as the wildlife trade or agricultural intensification," Epstein said.

And, said his colleague Olival, finding the animals that carry the disease is "not just an academic exercise."

"It's a way to inform public health measures," he said, "to try to stop zoonotic diseases before they emerge into humans."

National Institute of Allergy and Infections Diseases - Rocky Mo, via Associated Press

A new study suggests that camels are the major source of the Middle East Respiratory Syndrome, or MERS, a viral disease that has sickened 182 people and killed 79 of them since it was first detected in Saudi Arabia in 2012.

The animals are most likely to infect people through respiratory secretions — from coughing, sneezing, snorting or spitting — that travel through the air or cling to surfaces.

People with chronic illnesses like diabetes, lung disease or kidney failure, or other conditions that weaken their immunity, seem to be most susceptible, and should avoid close contact with camels, researchers say.

Saudi Arabia has had the most cases, other Middle Eastern countries have had a few and a handful of travelers from that region have taken the disease to Europe. There have been no cases in the United States. Although people have infected one another, the disease is not highly transmissible among humans, so researchers say that unless the virus changes to become more contagious in people, the risk of global spread does not seem high.

ADVERTISEMENT

Continue reading the main story

The new study provides the first evidence that the virus is widespread in dromedary camels (the kind with one hump) in Saudi Arabia, and has been for at least 20 years.

Younger animals are more likely than older ones to be infected and contagious. The virus invades the camels' nose and respiratory tract, but does not kill them. It is not known whether it even makes them sick.

"It would be very difficult to know if they were ill, since these are creatures that slobber a great deal," said Dr. W. Ian Lipkin, the senior author of the study and a virus expert at Columbia University's Mailman School of Public Health in New York. The results, by researchers from Saudi Arabia and the United States, were published on Tuesday in mBio, an online journal.

Tests on 203 dromedaries from different parts of Saudi Arabia found evidence of past infection in about 75 percent overall, with higher rates in some regions. About 35 percent of young animals and 15 percent of adults had current infections, with significant variations by region. In addition, measurements of stored blood samples from camels indicate that MERS or a virus closely related to it has been present in the animals since at least 1992.

Genetically, the virus found in camels matches samples from infected humans.

The disease was not detected in people until 2012. It is not known whether the cases in humans are a new phenomenon, or whether they have been occurring but were not recognized. Some people develop mild respiratory infections, but in others the disease turns deadly, with worsening fever, cough and shortness of breath.

In some cases, patients were known to have been around camels, but until recently it was not clear whether the animals might be the source. Other cases have been complete mysteries, with no known exposure to animals or ill humans. Sick people have infected family members, health workers and nearby patients in the hospital, but the virus is not considered highly contagious among humans.

Researchers do not know how camels become infected, but they suspect that the virus may have originally come from bats. MERS belongs to the coronavirus family, like SARS, the deadly and more contagious respiratory infection that began in China and caused a global outbreak in 2003. Bats are a host for SARS and other coronaviruses, and studies have found evidence linking MERS to bats.

But at this point the evidence linking people and camels is stronger.

"This is an issue for Saudi Arabia," said Peter Daszak, an author of the study and the president of EcoHealth Alliance, a group that studies the links between human and animal health. "Camels are highly valuable livestock, traded internationally. Unfortunately, they have an endemic virus that can cause death in people."

Camels are sold for meat and milk in the Middle East. There are also racing camels, and prized "beauty camels" that compete in pageants and have fetched prices of $1 million or more.

Dr. Lipkin and Dr. Daszak said it was not immediately obvious how to protect people who come into contact with camels, like farmers, breeders and slaughterhouse workers. But they said animals can be quickly and cheaply tested for the virus, and those with current infections could be quarantined and not sold or transported.

Dr. Lipkin said MERS in camels may be analogous to the many respiratory infections that children catch early in life and then become immune to. In camels, once tests no longer find the active infection, the risk of transmitting the disease is probably greatly reduced or even gone, Dr. Lipkin said.

He also said it may be possible to develop a vaccine to prevent the disease in camels. But he said creating a vaccine for people would not make sense, given that so far, MERS is rare.

Saudi Arabia imports many camels, from other countries in the Middle East, sub-Saharan Africa and Australia. Dr. Lipkin said studies should be done in those countries, or in animals being imported, to try to find out where MERS is coming from, in hopes of eliminating it.

2014 (June 29) - NYTimes : "Flawed Saudi Response Is Cited in Outbreak of the Middle East Virus MERS"

A camel market in Al-Thamama, Saudi Arabia. MERS infects camels and can spread to humans, possibly in raw camel milk.

Faisal Nasser/Reuters

By Ben Hubbard and Donald G. McNeil Jr. / [HN01HQ][GDrive]

JIDDA, Saudi Arabia — As the virus tore through the city's largest hospital, jumping from bed to bed and afflicting scores of people, terror filled the wards.

Some doctors and nurses refused to treat the sick or stopped coming to work altogether. Patients panicked. One surgeon recalled a man with a broken limb trying to flee the emergency room so he would not catch it, too.

"Everyone was afraid," the surgeon, Dr. Mohammed Ahmed, said of the spike in cases this spring.

It was the darkest hour since the new illness, known as Middle East respiratory syndrome, or MERS, first appeared in Saudi Arabia late in 2012. In all, more than 700 cases have been documented in 20 countries, nearly all of them linked to Saudi Arabia. More than 250 people have died.

The sudden spread of a mysterious and fatal new virus is reminiscent of the early days of SARS, or severe acute respiratory syndrome, a related disease that appeared in dozens of countries and killed more than 770 people, principally in Asia in 2003.

MERS circulates most heavily in a region that is the nexus for Islam. This port city, Jidda, is the arrival point for most of the two million to three million pilgrims who make the hajj to Mecca each year. Riyadh, the Saudi capital, has had the second-largest outbreak after Jidda, and cases have also appeared in Mecca. The hajj will not take place until October, but many Muslims travel to Mecca during the holy month of Ramadan, which most Muslims began observing on Sunday. And off-season pilgrims have already spread the disease to Iran, Jordan and Algeria.

Saudi officials know how urgently they need to beat the disease, and they say they now have the latest outbreak under control. But the fact that the number of cases and deaths has more than tripled since the end of 2013 has led health experts to cite grave flaws in the way this ultraconservative and staunchly private monarchy has handled the crisis.

King Abdullah fired the country's health minister and his deputy in April, leaving experts wondering whether the shake-up would bring greater transparency and international cooperation. "In the U.S., when you have a crisis like the Veterans Administration scandal, the new head is in front of the TV cameras explaining what the new plan is," said Dr. Peter Daszak, president of EcoHealth Alliance, a veterinary organization that tracked the disease in animals. "There is no tradition of openness in Saudi Arabia."

A World Health Organization panel said this month that the surge in cases that began in April had fallen off, but that "the situation remains serious" and that hospital outbreaks should be investigated for breaches in safety protocols.

"I am not saying we're not worried, but this is something that can be controlled," said Hanan Balkhy, executive director for infection prevention and control at Saudi Arabia's National Guard hospitals. "If this were Ebola, I would go the king myself and tell him, 'We need to isolate the kingdom.' "

Both SARS and MERS are coronaviruses, named for their shapes. Both are thought to have originated in bats and then spread through other animals to people. But while SARS circulated in obscure forest animals like palm civets that are eaten in southern China, MERS infects camels, which are common in the Middle East. MERS seems to jump more easily to humans, possibly in raw camel milk, but it spreads less readily between people than SARS did.

One theory gaining popularity is that MERS cases peak in the spring because camel calves are born at that time. So until a human or veterinary vaccine is developed, people in contact with camels must be careful, especially in the spring.

Yet the outbreak this year suggested that lapses in the kingdom's health system played a bigger role in spreading the virus than camels did. Most of the hundreds of new infections were linked to hospitals, dialysis clinics or other health facilities, and many were among staff members. Two health workers from Saudi clinics were hospitalized in Indiana and Florida.

The greatest number of new cases was at King Fahd Hospital in Jidda. Doctors said a mix of bad management, crowding and lax hygiene helped spread the virus there.

The outbreak came during the busiest time of year, when many Saudis were on vacation, leading to more car accidents, sports injuries and other mishaps, doctors said. New emergency patients were registered in a crowded area, and hospital rooms meant for four people often held 12.

Suspected MERS cases were not always identified and isolated, and patients unwittingly spread the virus around the hospital — one in the cardiac ward, and another among dialysis patients, according to Dr. Ahmed Ragab, chief of the hospital's intensive-care unit.

"If one patient came in with the virus, all the others would get it, because they were all next to each other," Dr. Ragab said.

Some medical staff members were lax with sanitary measures, not wearing masks or infrequently sanitizing their hands. Many fell ill.

When the king fired the health minister, Abdullah al-Rabeeah, in April, he gave the job to the labor minister, Adel Fakieh, who is known for bypassing the kingdom's bloated and inefficient bureaucracy. Mr. Fakieh enlisted McKinsey & Company, the corporate consulting firm, and opened a command center in Jidda to track cases.

The changes at the top soon filtered down to King Fahd Hospital, where Dr. Imad al-Jahdali became director in May.

Image

Mohamed Alhwaity/Reuters

“The scene at the time was panic, from the public and from the media,” Dr. Jahdali recalled. “King Fahd Hospital was the spotlight for everything.”

He divided the hospital in two, with one half exclusively for MERS patients. Anyone with a fever and breathing problems is quickly isolated for testing.

The disease has been surrounded by controversy since it came to light, when an Egyptian microbiologist, Ali Mohammed Zaki, sent a sample from a Jidda hospital to Rotterdam, in the Netherlands. Dutch researchers patented the new virus and named it after their center, enraging Saudi officials, who considered the action intellectual property theft. They fired Dr. Zaki and petitioned the W.H.O. for a new name for the virus.

Scientists from 18 universities or health agencies in eight countries were recruited to work on the virus. Egos began clashing, especially as teams raced to publish results. Two rivals published the genomes of viruses from the same patient and his camel in separate academic journals.

Some researchers accused the Saudi deputy minister of health, Ziad Memish, of duplicity and bad management, saying he hampered progress, while others said he was made a fall guy for an outbreak beyond his control.

Dr. Memish, described recently in The Lancet, the British medical journal, as “the father of mass gatherings medicine” for his work on protecting pilgrims, denied accusations that he took credit for the work of others or kept sloppy records. But he acknowledged occasionally switching cooperation from one team to another, bruising feelings.

“Some collaborations began and prospered; some did not,” Dr. Memish said by email. “That’s the way science and life progresses, sometimes.”

One recent afternoon, a family brought an old woman with a nasty cough to King Fahd Hospital. She was immediately wheeled into an isolation room. Dr. Jahdali watched proudly as health workers blocked her relatives from following, so they would not get sick. Confirmed cases go to a special wing where rooms with tight sliding glass doors hold one patient each and nurses wear gloves and snug-fitting masks.

Whether Saudi Arabia can get the virus under control will depend, experts said, on how effectively such measures can be applied nationally — not an easy task in a country of long distances and weak government oversight of some health centers.

The number of new cases reported nationally appears to be falling, with about 200 in May and only 27 since then, the Health Ministry said.

“The most direct cause of this improvement — after, of course, the blessing of Allah — is the stringent implementation of infection control in hospitals,” said Tariq Madani, who heads the Health Ministry’s MERS task force.

Lab-Made Coronavirus Triggers Debate

The creation of a chimeric SARS-like virus has scientists discussing the risks of gain-of-function research.

Jef Akst

Ralph Baric, an infectious-disease researcher at the University of North Carolina at Chapel Hill, last week (November 9) published a study on his team’s efforts to engineer a virus with the surface protein of the SHC014 coronavirus, found in horseshoe bats in China, and the backbone of one that causes human-like severe acute respiratory syndrome (SARS) in mice. The hybrid virus could infect human airway cells and caused disease in mice, according to the team’s results, which were published in *Nature Medicine*.

The results demonstrate the ability of the SHC014 surface protein to bind and infect human cells, validating concerns that this virus—or other coronaviruses found in bat species—may be capable of making the leap to people without first evolving in an intermediate host, *Nature* reported. They also reignite a debate about whether that information justifies the risk of such work, known as gain-of-function research. “If the [new] virus escaped, nobody could predict the trajectory,” Simon Wain-Hobson, a virologist at the Pasteur Institute in Paris, told *Nature*.

In October 2013, the US government put a stop to all federal funding for gain-of-function studies, with particular concern rising about influenza, SARS, and Middle East respiratory syndrome (MERS). “NIH [National Institutes of Health] has funded such studies because they help define the fundamental nature of human-pathogen interactions, enable the assessment of the pandemic potential of emerging infectious agents, and inform public health and preparedness efforts,” NIH Director Francis Collins said in a statement at the time. “These studies, however, also entail biosafety and biosecurity risks, which need to be understood better.”

Baric’s study on the SHC014-chimeric coronavirus began before the moratorium was announced, and the NIH allowed it to proceed during a review process, which eventually led to the conclusion that the work did not fall under the new restrictions, Baric told *Nature*. But some researchers, like Wain-Hobson, disagree with that decision.

The debate comes down to how informative the results are. “The only impact of this work is the creation, in a lab, of a new, non-natural risk,” Richard Ebright, a molecular biologist and biodefence expert at Rutgers University, told *Nature*.

But Baric and others argued the study’s importance. “[The results] move this virus from a candidate emerging pathogen to a clear and present danger,” Peter Daszak, president of the EcoHealth Alliance, which samples viruses from animals and people in emerging-diseases hotspots across the globe, told *Nature*.

October 16, 2014 - Francis S. Collins, M.D., Ph.D. Director, National Institutes of Health - Statement on Funding Pause on Certain Types of Gain-of-Function Research

[https://www.nih.gov/about-nih/who-we-are/nih-director/statements/statement-funding-pause-certain-types-gain-function-research / 2014-10-16-us-nih-statement-on-funding-pause-on-certain-gof.pdf] - From Francis S. Collins, M.D., Ph.D. Director, National Institutes of Health

The White House Office of Science and Technology Policy announced today that the U.S. government will undertake a deliberative process to assess the risks and benefits of certain gain-of-function (GOF) experiments with influenza, SARS, and MERS viruses in order to develop a new Federal policy regarding the funding of this research. During this deliberative process, U.S. government agencies will institute a pause on the funding of any new studies involving these experiments. For purposes of the deliberative process and this funding pause, "GOF studies" refers to scientific research that increases the ability of any of these infectious agents to cause disease by enhancing its pathogenicity or by increasing its transmissibility among mammals by respiratory droplets.

NIH has funded such studies because they help define the fundamental nature of human-pathogen interactions, enable the assessment of the pandemic potential of emerging infectious agents, and inform public health and preparedness efforts. These studies, however, also entail biosafety and biosecurity risks, which need to be understood better. NIH will be adhering to this funding pause until the robust and broad deliberative process described by the White House — including consultation with the National Science Advisory Board for Biosecurity (NSABB) and input from the National Research Council of the National Academies — is completed.

During this pause, NIH will not provide new funding for any projects involving these experiments and encourages those currently conducting this type of work — whether federally funded or not — to voluntarily pause their research while the government determines how to proceed.

Public involvement in this deliberative process is key, and the process is thus designed to be transparent, accessible, and open to input from all sources. Consultation with the NSABB, the first step in this process, will take place October 22, and I encourage you to follow these deliberations closely.

Peter Daszak, Ph.D., is President of EcoHealth Alliance, a U.S.-based organization that conducts research and outreach programs on global health, conservation and international development. Dr. Daszak's research has been instrumental in identifying and predicting the impact of emerging diseases across the globe. His achievements include identifying the bat origin of SARS, identifying the underlying drivers of Nipah and Hendra virus emergence, producing the first ever global emerging disease "hotspots" map, identifying the first case of a species extinction due to disease, coining the term "pathogen pollution," and discovering the disease chytridiomycosis as the cause of global amphibian declines. Dr. Daszak is a member of the National Academies of Sciences, Engineering, and Medicine's Forum on Microbial Threats, the Academies Advisory Committee to the U.S. Global Change Research Program (USGCRP), the Supervisory Board of the One Health Platform, the One Health Commission Council of Advisors, and the Center of Excellence for Emerging and Zoonotic Animal Diseases (CEEZAD) External Advisory Board. He has served on the Institue of Medicine (IOM) committee on global surveillance for emerging zoonoses, the National Research Council (NRC) committee on the future of veterinary research, the International Standing Advisory Board of the Australian Biosecurity CRC; and has advised the Director for Medical Preparedness Policy on the White House National Security Staff on global health issues. Dr. Daszak won the 2000 CSIRO medal for collaborative research on the discovery of amphibian chytridiomycosis, is the EHA institutional lead for the United States Agency for International Development (USAID) Emerging Pandemic Threats-PREDICT and PREDICT-2, is on the editorial board of *Conservation Biology and Transactions of the Royal Society of Tropical Medicine & Hygiene*, and is Editor-in-Chief of the journal *Ecohealth*. He has authored more than 200 scientific papers, and his work has been the focus of extensive media coverage, ranging from popular press articles to television appearances.

Tara O'Toole, M.D., M.P.H., is senior fellow and executive vice president at In-Q-Tel (IQT), a private, nonprofit strategic investment firm that links the U.S. Intelligence Community and venture-backed start-up firms on the leading edge of technological innovation. Dr. O'Toole is leading a strategic IQT initiative to explore opportunities and risks likely to arise in the next decade as a result of advances in the biological sciences and biotechnologies, with a particular focus on detection of and defense against biological attacks. From 2009 to 2013, Dr. O'Toole served as under secretary of Science and Technology (S&T) at the Department of Homeland Security, the principal adviser to the secretary on matters related to science and technology. Under Dr. O'Toole's leadership, S&T created the department's first division of cybersecurity research, a division devoted to delivering technologies to first responders, and a system engineering division. She won approval and funding from the Administration and Congress to begin construction of an urgently needed, long-delayed high containment laboratory for emergent and contagious animal diseases. In the decade before becoming under secretary, Dr. O'Toole founded and directed two university-based think tanks devoted to civilian biodefense. She was a professor of public health and director of the Johns Hopkins University Center for Civilian Biodefense Studies at the Johns Hopkins Bloomberg School of Public Health, which was the first academic center devoted to biosecurity policy and practices, and played a major role in defining the nature and consequences of major biological threats, both natural and deliberate. In 2003, Dr. O'Toole was CEO and director of the Center for Biosecurity of the University of Pittsburgh Medical Center and professor of medicine and public health at the University of Pittsburgh. From 1994 to 1998, Dr. O'Toole served in President Clinton's administration as assistant secretary for Environment Safety and Health in the Department of Energy. From 1989 to 1993, Dr. O'Toole was a senior analyst at the Congressional Office of Technology Assessment (OTA). Prior to OTA, she practiced internal medicine in community health centers in east Baltimore as part of the Public Health Service. Dr. O'Toole is a past chair of the board of the Federation of American Scientists, and is a member of the Council on Foreign Relations. She received her B.A. from Vassar College, her M.D. from the George Washington University School of Medicine, and her M.P.H. from the Johns Hopkins Bloomberg School of Public Health. She is board certified in internal medicine and occupational and environmental medicine.

2018 (April 13) - NYTimes : "Trillions Upon Trillions of Viruses Fall From the Sky Each Day"

Viruses attached to a fragment of a bacterial cell wall. "Viruses modulate the function and evolution of all living things," scientists wrote last year. "But to what extent remains a mystery."

Credit... Biophoto Associates/Science Source

By Jim Robbins / [HN01HP][GDrive]

High in the Sierra Nevada mountains of Spain, an international team of researchers set out four buckets to gather a shower of viruses falling from the sky.

Scientists have surmised there is a stream of viruses circling the planet, above the planet's weather systems but below the level of airline travel. Very little is known about this realm, and that's why the number of deposited viruses stunned the team in Spain. Each day, they calculated, some 800 million viruses cascade onto every square meter of the planet.

Most of the globe-trotting viruses are swept into the air by sea spray, and lesser numbers arrive in dust storms.

"Unimpeded by friction with the surface of the Earth, you can travel great distances, and so intercontinental travel is quite easy" for viruses, said Curtis Suttle, a marine virologist at the University of British Columbia. "It wouldn't be unusual to find things swept up in Africa being deposited in North America."

The study by Dr. Suttle and his colleagues, published earlier this year in the International Society of Microbial Ecology Journal, was the first to count the number of viruses falling onto the planet. The research, though, is not designed to study influenza or other illnesses, but to get a better sense of the

"virosphere," the world of viruses on the planet.

Generally it's assumed these viruses originate on the planet and are swept upward, but some researchers theorize that viruses actually may originate in the atmosphere. (There is a small group of researchers who believe viruses may even have come here from outer space, an idea known as panspermia.)

Whatever the case, viruses are the most abundant entities on the planet by far. While Dr. Suttle's team found hundreds of millions of viruses in a square meter, they counted tens of millions of bacteria in the same space.

Mostly thought of as infectious agents, viruses are much more than that. It's hard to overstate the central role that viruses play in the world: They're essential to everything from our immune system to our gut microbiome, to the ecosystems on land and sea, to climate regulation and the evolution of all species. Viruses contain a vast diverse array of unknown genes — and spread them to other species.

Last year, three experts called for a new initiative to better understand viral ecology, especially as the planet changes. "Viruses modulate the function and evolution of all living things," wrote Matthew B. Sullivan of Ohio State, Joshua Weitz of Georgia Tech, and Steven W. Wilhelm of the University of Tennessee. "But to what extent remains a mystery."

Image

Viruses reproduce by attaching to a bacterium and injecting their own genes. Ancient viral DNA eventually became part of the nervous system of modern humans, playing a role in consciousness, nerve communication and memory formation.

Credit...

Biozentrum, University of Basel/Science Source

Do viruses even fit the definition of something alive? While they are top predators of the microbial world, they lack the ability to reproduce and so must take over the cell of a host — called an infection — and use its machinery to replicate. The virus injects its own DNA into the host; sometimes those new genes are useful to the host and become part of its genome.

Researchers recently identified an ancient virus that inserted its DNA into the genomes of four-limbed animals that were human ancestors. That snippet of genetic code, called ARC, is part of the nervous system of modern humans and plays a role in human consciousness — nerve communication, memory formation and higher-order thinking. Between 40 percent and 80 percent of the human genome may be linked to ancient viral invasions.

Viruses and their prey are also big players in the world's ecosystems. Much research now is aimed at factoring their processes into our understanding of how the planet works.

"If you could weigh all the living material in the oceans, 95 percent of it is stuff is you can't see, and they are responsible for supplying half the oxygen on the planet," Dr. Suttle said.

In laboratory experiments, he has filtered viruses out of seawater but left their prey, bacteria. When that happens, plankton in the water stop growing. That's because when preying viruses infect and take out one species of microbe — they are very specific predators — they liberate nutrients in them, such as nitrogen, that feed other species of bacteria. In the same way, an elk killed by a wolf becomes food for ravens, coyotes and other species. As plankton grow, they take in carbon dioxide and create oxygen.

One study estimated that viruses in the ocean cause a trillion trillion infections every second, destroying some 20 percent of all bacterial cells in the sea daily.

Viruses help keep ecosystems in balance by changing the composition of microbial communities. As toxic algae blooms spread in the ocean, for example, they are brought to heel by a virus that attacks the algae and causes it to explode and die, ending the outbreak in as little as a day.

While some viruses and other organisms have evolved together and have achieved a kind of balance, an invasive virus can cause rapid, widespread changes and even lead to extinction.

West Nile virus has changed the composition of bird communities in much of the United States, killing crows and favoring ravens, some researchers say. Multiple extinctions of birds in Hawaii are predicted as the mosquito-borne avipoxvirus spreads into mountain forests where it was once too cold for mosquitoes to live.

When species disappear, the changes can ripple through an ecosystem. A textbook example is a viral disease called rinderpest.

Image

An engraving showing a cattle inspection at a market in 19th century London, when rinderpest, a viral disease, was rampant in Europe and Africa, wiping out some herds entirely.

Credit...

Universal History Archive/UIG, via Getty Images

The Italian army brought a few cattle into North Africa, and in 1887 the virus took off across the continent, killing a broad range of cloven-hoofed animals from Eritrea to South Africa — in some cases wiping out 95 percent of the herds.

"It infected antelope, it infected wildebeest and other large grazers across the whole ecosystem," said Peter Daszak, the president of Ecohealth Alliance, which is working on a global project to catalog viruses likely to pass from animals to humans.

"The impact was not just on the animals. But because they are primary grazers and they died off in huge numbers, vegetation was impacted, and it allowed trees to grow where they would have been grazed away," he said.

"The large acacia trees on the plains of Africa are all the same age and were seedlings when rinderpest first came in and the wildlife died," Dr. Daszak said. In other places, far less grazing created a hospitable habitat for the tsetse fly, which carries the parasites that cause sleeping sickness.

"These kinds of ecological changes can last for centuries or even millennia," Dr. Daszak said.

Combined with drought, large numbers of people died from starvation as rinderpest spread. An explorer in 1891 estimated two-thirds of the Masai people

Combined with drought, large numbers of people died from starvation as rinderpest spread. An explorer in 1891 estimated two-thirds of the Maasai people, who depended on cattle, were killed.

“Almost instantaneously, rinderpest swept away the wealth of tropical Africa,” wrote John Reader in his book “Africa: A Biography of a Continent.”

With intensive vaccinations, rinderpest was completely wiped out, not only in Africa but globally in 2011.

The beneficial effects of viruses are much less known, especially among plants. “There are huge questions in wild systems about what viruses are doing there,” said Marilyn Roossinck, who studies viral ecology in plants at Pennsylvania State University. “We have never found deleterious effects from a virus in the wild.”

A grass found in the high-temperature soils of Yellowstone’s geothermal areas, for example, needs a fungus to grow in the extreme environment. In turn, the fungus needs a virus.

Tiny spots of virus on the plant that yields quinoa is also important for the plant’s survival. “Little spots of virus confer drought tolerance but don’t cause disease,” she said. “It changes the whole plant physiology.”

“Viruses aren’t our enemies,” Dr. Suttle said. “Certain nasty viruses can make you sick, but it’s important to recognize that viruses and other microbes out there are absolutely integral for the ecosystem.”

2018 (April 17) - NYTimes : "New York Mice Are Crawling With Dangerous Bacteria and Viruses"

Analyses of more than 400 mice in New York City found that they carried previously unknown viruses and antibiotic-resistant bacteria.

Credit...

Gianni Cipriano for The New York Times

By Karen Weintraub / [HN01HO][GDrive]

Mice that live in the basements of New York City apartment buildings — even at the most exclusive addresses — carry disease-causing bacteria, antibiotic-resistant bugs and viruses that have never been seen before, a new study from Columbia University finds.

Researchers collected feces from more than 400 mice captured over a year in eight buildings in Manhattan, Brooklyn, Queens and the Bronx. The team then analyzed the droppings for bacteria and viruses.

The viruses included nine species that had never been seen before and others that have not been known to cause human disease, according to the study, published Tuesday in the journal mBio.

But in a second study focused on bacteria, the researchers detected some of the most recognizable disease-causing pathogens, including Shigella, Salmonella, Clostridium difficile and E. coli. The scientists also found antibiotic-resistant bacteria like those that have become nearly untreatable at area hospitals.

It's unclear whether the bacteria on the mice pose any health threat to people or have caused any human disease. But for centuries, rodents have been linked to illnesses like the Black Death.

"They are a potential source of human infection," said Dr. W. Ian Lipkin, the epidemiologist at the Mailman School of Public Health at Columbia who was the senior author on the study. "The real message is that these things are everywhere."

The mice appeared to be healthy, and Dr. Lipkin said he presumes that they are carriers of the bacteria but are not affected by them.

Dr. Lipkin said it was not clear whether the mice were getting the antibiotic-resistant bacteria from people — say, by eating food contaminated with the feces of someone taking antibiotics — or whether the bacteria developed resistance after mice ate discarded antibiotics.

It would be nearly impossible to conduct research directly linking a mouse pathogen with a human disease, said Charles Calisher, a professor emeritus at Colorado State University, who was not involved in the new studies.

The source of patients' infections are rarely investigated, and they are not usually asked about their contact with mice, he said. "These are not simple things to investigate," Dr. Calisher said.

Peter Daszak, who heads the EcoHealth Alliance, a nonprofit that researches emerging diseases around the world, also described the research as difficult.

It's crucial to identify and trace these microbes, he said, to help understand how they are transmitted and how, if necessary, to protect ourselves from the diseases they may carry.

"If we don't know where they originate, we can't identify what's driving them and then we can't control it," said Dr. Daszak, who was not involved in the research.

No one knows, for example, whether antibiotic resistance genes emerged in hospitals, in cities or in rural areas.

This research is particularly important to do in New York, Dr. Daszak said, because the city is a destination for people from all corners of the world.

"New York is a major at-risk place for pathogens," he said. "We're certainly on the front line for emerging diseases."

He said that the new research should not make New Yorkers more fearful of mice. "I'm not worried personally," said Dr. Daszak, who lives in suburban Rockland County but works in the city. "Luckily, this is a species we're already trying to control."

Dr. Lipkin began researching New York City's natural pathogens after the terrorist attacks of 9/11, when scientists realized they did not have a baseline to compare any changes. His lab has also studied rats on the New York City subway system and found many of the same infectious bacteria.

Although it is impossible to completely get rid of urban mice, Dr. Lipkin said his study suggests that more should be done to control mouse populations and their interactions with people.

Large apartment buildings should fill any gaps in their foundations, and trap and control any rodents found indoors, Dr. Calisher said.

Should everybody get a cat? "Cats have their own viruses," Dr. Calisher noted.

Nowadays, scientific discoveries pervade every aspect of our lives. As such, the need for us to understand this world better is ever more compelling. So what global environment are we looking at? Is the scientific divide getting bigger? What are the enabling factors to propel greater scientific progress and awareness in today's world? And where do the media fit into the picture? Science Matters is a special program of The Point with LIU Xin in collaboration with the Chinese Society for Science and Technology Journalism.

2019 (August) - Report in Lancet : "One Health Commissioner Peter Daszak is Back in Oslo"

Source - [HI000F][GDrive]

Professor Peter Daszak, President of the EcoHealth Alliance and Commissioner in the Lancet One Health Commission chaired by the Centre for Global Health (CGH) at UiO, gave a talk to a captivated multidisciplinary audience at the Norwegian Veterinary Institute in Oslo on August 28th.

> Photo: From left, Gaute Lenvik, Managing Director at Norwegian Veterinary Institute, Ingeborg Haavardsson, Managing Director of Centre for Global Health, UiO, Ernst Kristian Rødland, Postdoctoral Fellow, UiO, Peter Daszak, President of EcoHealth Alliance, Carlos Goncalo Das Neves, Director of Research and Internationalization at Norwegian Veterinary Institute & Osama Ahmed Hassan Ahmed, Postdoctoral Fellow, UiO Photo by: Marianne Carson, UiO

Predicting the next pandemic with One Health

In his invited lecture on "Can One Health Help Prevent the Next Pandemic?" Prof. Daszak talked about how emerging infectious diseases are a growing global threat. These diseases are complex and hard to predict. Many of these emerging diseases are zoonotic, meaning that they can spread form animals to humans. A One Health approach, which recognises the interaction between humans, animals and the environment could help disease prediction and preparedness.

He talked about his extensive work on these emerging infectious diseases, from researching the origins of deadly outbreaks of Nipah virus in Malaysia and SARS in China, to mapping hotspots for emerging diseases around the world. He discussed the interrelated roles of human population density, wildlife diversity and environmental change and how we can use awareness of these risk factors to predict where the next big viral diseases will emerge. He used the example of how land use change, through for example deforestation, can disturb ecosystems and affect wildlife. Wildlife such as bats and rodents are carriers for some of the world's most dangerous viruses, including Ebola. They and other mammals are also likely carriers of yet unknown viruses.

Prof. Daszak further argued for the need for global research initiatives focused on identifying unknown viruses. Though costly, the early identification of these potentially deadly threats could help reduce the cost and global burden of disease. He highlighted the ongoing Global Virome Project, which is an international initiative aiming to do just that.

To deal with emerging infectious diseases we need to consider human, animal and environmental issues. This means involving experts from many different fields including ecologists, veterinarians and social scientists. Following a question from the audience, Prof. Daszak discussed how medical doctors also need to be involved, but that there needs to be more engagement with the medical community.

Prof. Daszak concluded his talk by saying that these diseases are a long-term, existential risk to our species, but that they are also diseases we can do something about. There is value in investing in this kind of research.

2019 (Oct 25) - NYTimes - "Scientists Were Hunting for the Next Ebola. Now the U.S. Has Cut Off Their Funding."

Predict, a government research program, sought to identify animal viruses that might infect humans and to head off new pandemics.

Arlette Kavugho, 40, mother of six and an Ebola survivor, carries Kambale Eloge, 16 months old, whose mother died of the disease, in Katwa, near Butembo, Democratic Republic of Congo. USAID's Predict project helped identify Ebola's routes of transmission.

By Donald G. McNeil Jr. / [HN01HN][GDrive]

In a move that worries many public health experts, the federal government is quietly shutting down a surveillance program for dangerous animal viruses that someday may infect humans.

The United Nations Environment Program estimates that a new animal disease that can also infect humans is discovered every four months. Ending the program, experts fear, will leave the world more vulnerable to lethal pathogens like Ebola and MERS that emerge from unexpected places, such as bat-filled trees, gorilla carcasses and camel barns.

The program, known as Predict and run by the United States Agency for International Development, was inspired by the 2005 H5N1 bird flu scare. Launched 10 years ago, the project has cost about $207 million.

The initiative has collected over 140,000 biological samples from animals and found over 1,000 new viruses, including a new strain of Ebola. Predict also trained about 5,000 people in 30 African and Asian countries, and has built or strengthened 60 medical research laboratories, mostly in poor countries.

Dennis Carroll, the former director of USAID's emerging threats division who helped design Predict, oversaw it for a decade and retired when it was shut down. The surveillance project is closing because of "the ascension of risk-averse bureaucrats," he said.

Because USAID's chief mission is economic aid, he added, some federal officials felt uncomfortable funding cutting-edge science like tracking exotic pathogens.

Congress, along with the administrations of George W. Bush and Barack Obama, were "enormously supportive," said Dr. Carroll, who is now a fellow at Texas A&M's Bush School of Government and Public Service.

"But things got complicated in the last two years, and by January, Predict was essentially collapsed into hibernation."

The end of the program "is definitely a loss," said Peter Daszak, president of the EcoHealth Alliance, a nonprofit global health organization that received funding from the program. "Predict was an approach to heading off pandemics, instead of sitting there waiting for them to emerge and then mobilizing. That's expensive."

"The United States spent $5 billion fighting Ebola in West Africa," he added. "This costs far less."

The goal of Predict was to speed up and organize the previously haphazard hunt for zoonotic diseases — those that may jump from animals to humans. In recent years, scientists have discovered many lethal viruses lurking in wild and domestic animals.

It has long been known, of course, that AIDS originated in chimpanzees and probably was first contracted by bushmeat hunters. Ebola circulates in bats and apes, while SARS was found in captive civet cats in China.

In South Asia, Nipah virus reaches humans through pigs or date palm sap infected by bats carrying the virus. In Saudi Arabia, MERS also is carried by bats; they infect camels, which then infect humans. The virus can jump from human to human, especially in hospitals.

Novel influenza viruses originate in migratory ducks and geese. The viruses spread first to domestic poultry flocks, then to pigs and humans. Mutations picked up along that viral highway can render the viruses far more dangerous.

These discoveries led to new ways of preventing spillovers of infections into human populations: closing markets where wildlife is butchered for food,; putting bamboo skirts on sap-collection jars to keep bats out; or penning pigs and camels in places where they cannot eat fruit that bats have gnawed.

Predict teams have investigated mysterious disease outbreaks in many countries, including a die-off of 3,000 wild birds in a Mongolian lake. One team proved that endangered otters in a Cambodian zoo were killed by their feed — raw chickens infected with bird flu.

A Predict laboratory helped identify bat-borne viruses that a boys' soccer team might have been exposed to while trapped for weeks in a cave in Thailand.

Allowing Predict to end "is really unfortunate, and the opposite of what we'd like to see happening," said Dr. Gro Harlem Brundtland, the former prime minister of Norway and former World Health Organization director-general.

She was co-chair of a panel that in September issued a report detailing the world's failure to prepare for pandemics. "Americans need to understand how much their health security depends on that of other countries, often countries that have no capacity to do this themselves," Dr. Brundtland said.

Even though USAID is "incredibly proud and happy over the work Predict has done," the program is closing because it reached the end of a 10-year funding cycle, said Irene Koek, acting assistant administrator of the agency's global health bureau.

"We typically do programs in five-year cycles, and it had two," she said. Some similar research will be part of future budget requests, "but it's still in the design-and-procurement cycle, so exactly what will continue is a bit of a black box."

In mid-October, the agency said it would spend $85 million over the next five years helping universities in Africa and Asia teach the "one-health" approach that Predict used. ("One health" describes the nexus between animal, human and environmental medicine).

But it will not involve the daring fieldwork that Predict specialized in.

Among the institutions that worked on Predict projects are those staffed by wildlife veterinarians and disease-trackers like the University of California, Davis's One Health Institute; the EcoHealth Alliance; the Wildlife Conservation Society, which runs the Bronx Zoo; the Smithsonian Institution, which manages the National Zoo in Washington; and Columbia University's Center for Infection and Immunity.

Some Predict projects will be taken over by other government agencies, such as the Pentagon's Defense Threat Reduction Agency or the National Institutes of Health. But those agencies have different missions, such as basic research or troop protection. They do not share USAID's goal of training poor countries to do the work themselves.

As an agency that gives money to countries, USAID often has a friendlier, more cooperative relationship with governments in poor nations than, for example, Pentagon-led efforts might.

"I've always been impressed with the way they were able to work with ministries of health," said Dr. James M. Hughes, a former chief of infectious diseases at the Centers for Disease Control and Prevention who was on Predict's advisory board. "They have a high level of trust, and they help countries comply with the International Health Regulations."

(Those regulations, in force since 2007, require countries to report all major disease outbreaks to the World Health Organization and allow the W.H.O. to declare health emergencies.)

USAID still supports some health-related programs like the President's Malaria Initiative and the President's Emergency Plan for AIDS Relief. But Dr. Carroll described those as "cookbook portfolios."

How to fight those diseases is well-known, he explained, so the agency just comes up with a budget for drugs, diagnostic kits, insecticides, mosquito nets, condoms or other long-established interventions.

Predict more often placed medical detectives in the field, training local doctors, veterinarians, wildlife rangers and others to collect samples from wild and domestic animals.

It can be highly specialized work. Getting blood samples from pigs or wild rodents is fairly routine, but catching birds, bats or monkeys alive is not. Gorillas are harder. (Scientists usually content themselves with just collecting gorilla feces.)

Predict also experimented with novel ways to catch and release animals unharmed, to transport samples without refrigeration and to use DNA testing that can scan for whole viral families instead of just known viruses, said Dr. Christine Kreuder Johnson, associate director of the One Health Institute at the University of California, Davis.

Predict sponsored epidemiological modeling to predict where outbreaks are likely to erupt. It also sought ways to curb practices, such as hunting for bushmeat or breeding racing camels, that encourage eruptions.

After that West African Ebola outbreak, Predict researchers determined exactly which bat species carried the Ebola Zaire strain that caused it. Another team in Sierra Leone discovered a new strain of the virus, now known as Ebola Bombali.

Image

Credit...

Bryan Denton for The New York Times

The Zaire strain was found in a bat that roosts in caves and mines, said Dr. Jonathan Epstein, an EcoHealth Alliance veterinarian, while the Bombali type was in a species that roosts in houses.

Distinctions like that are important for telling people — especially people who eat bats — which species are dangerous.

"We generated an illustrated book on how to keep bats out of houses by putting screens on windows or mesh below the roof thatch," he said. "That's the kind of thing Predict paid for."

Predict served as a proof of concept for a much more ambitious idea that Dr. Carroll proposed several years ago: the Global Virome Project, which envisioned trying to compile a genetic atlas of all the viruses circulating in all animals. By some estimates, there are more than 800,000 such viruses waiting to be discovered.

Many scientists questioned the wisdom of spending as much as would be needed to do that — over $3 billion. But those experts also argued that Predict, which is focused on viruses dangerous to humans, was very much worth the relatively modest amounts of money it cost.

"Predict needed to go on for 20 years, not 10," Dr. Epstein said. "We were getting to the point of having a trained work force that could gather animal samples and labs that could test for unknown viruses, not just known ones."

"Once it stops, it's going to be hard to maintain that level of proficiency."

2020 (Feb27) - NY Times Editorial : "We Knew Disease X Was Coming. It's Here Now." by Peter Daszak

Source (NY Times) - [HN00P3][GDrive]

In early 2018, during a meeting at the World Health Organization in Geneva, a group of experts I belong to (the R&D Blueprint) coined the term "Disease X": We were referring to the next pandemic, which would be caused by an unknown, novel pathogen that hadn't yet entered the human population. As the world stands today on the edge of the pandemic precipice, it's worth taking a moment to consider whether Covid-19 is the disease our group was warning about.

Disease X, we said back then, would likely result from a virus originating in animals and would emerge somewhere on the planet where economic development drives people and wildlife together. Disease X would probably be confused with other diseases early in the outbreak and would spread quickly and silently; exploiting networks of human travel and trade, it would reach multiple countries and thwart containment. Disease X would have a mortality rate higher than a seasonal flu but would spread as easily as the flu. It would shake financial markets even before it achieved pandemic status.

In a nutshell, Covid-19 is Disease X.

Even as there are signs that the epidemic's spread might be slowing in China, multiple communities and countries have now reported sustained transmission in their midst. The number of confirmed cases has exploded in South Korea in recent days. In Italy, villages and towns are on lockdown, Fashion Week in Milan has been disrupted and festivals are being canceled while public health authorities search for patient zero to identify who else is likely infected and may spread the disease in Europe. Iran appears to have become a new hub of transmission. The looming pandemic will challenge us in new ways, as people try to evade quarantines, and misinformation campaigns and conspiracy theorists ply their trade in open democracies.

But as the world struggles to respond to Covid-19, we risk missing the really big picture: Pandemics are on the rise, and we need to contain the process that drives them, not just the individual diseases.

Plagues are not only part of our culture; they are caused by it. The Black Death spread into Europe in the mid-14th century with the growth of trade along the Silk Road. New strains of influenza have emerged from livestock farming. Ebola, SARS, MERS and now Covid-19 have been linked to wildlife. Pandemics usually begin as viruses in animals that jump to people when we make contact with them.

These spillovers are increasing exponentially as our ecological footprint brings us closer to wildlife in remote areas and the wildlife trade brings these animals into urban centers. Unprecedented road-building, deforestation, land clearing and agricultural development, as well as globalized travel and trade, make us supremely susceptible to pathogens like coronaviruses.

Yet the world's strategy for dealing with pandemics is woefully inadequate. Across the board, from politicians to the public, we treat pandemics as a disaster-response issue: We wait for them to happen and hope a vaccine or drug can be developed quickly in their aftermath. But even as Covid-19 rages, there still is no vaccine available for the SARS virus of 2002-3, nor for HIV/AIDS or Zika or a host of emerging pathogens. The problem is that between outbreaks, the will to spend money on prevention wanes, and the market for vaccines and drugs against sporadic viral diseases isn't enough to drive research and development.

During its World Health Assembly in 2016, the W.H.O. set up the R&D Blueprint to bridge this gap and announced a priority list of pathogens that most threaten global health and for which no vaccines or drugs were in the pipeline. SARS made the list, as did MERS, Nipah, Ebola and other rare but serious diseases caused by epidemic viruses. The Coalition for Epidemic Preparedness

Innovations — a global partnership between public, private, philanthropic and civil society organizations launched at Davos in 2017 — stepped up to the plate and sourced funding to develop vaccines and therapeutics against some of these.

To escape from the Age of Pandemics, we'll need to treat them as a public health issue and start working on prevention in addition to responses. Our first goal should be to broaden our armory against potential mass epidemics. When some of us added "Disease X" to the W.H.O.'s priority list two years ago, we wanted to make the point that it's not sufficient to develop vaccines and drugs for known agents when the next big one is likely to be a different pathogen — a virus close to SARS, say, but not close enough that the same vaccine can work against both.

As Covid-19 strikes today and a spate of other pathogens are ready to emerge in the future, we continue to butt up against nature.

Scientists estimate that there are 1.67 million unknown viruses of the type that have previously emerged in people. Discovering and sequencing them should be a priority — a simple case of "know your enemy." In the aftermath of SARS, research on coronaviruses originating in bats has discovered more than 50 related viruses, some of which have the potential to infect people; this information can now be used to test for broad-action vaccines and drugs. Scaling up this effort to cover all viral families, as the Global Virome Project proposes to do, is a logical first step toward prevention.

A radical shift is also needed in the way that tests, vaccines and drugs are designed so that entire groups of pathogens are targeted instead of individual pathogens that are already known. The National Institute of Allergy and Infectious Diseases in the United States is working on a universal flu vaccine that would cover all known strains of influenza; a universal coronavirus vaccine, an Ebola-virus vaccine and others will also be needed.

With a smaller investment, we can also try to get ahead of pandemics by working with communities in hot spots of emerging diseases. Disease surveillance should be focused on farmers, rural communities and anyone who has extensive contact with wildlife, to look for unusual illnesses, test for novel pathogens and work with people to develop alternatives to high-risk activities such as the wildlife trade.

Pandemics are like terrorist attacks: We know roughly where they originate and what's responsible for them, but we don't know exactly when the next one will happen. They need to be handled be handled the same way — by identifying all possible sources and dismantling those before the next pandemic strikes.

Peter Daszak is a disease ecologist and the president of EcoHealth Alliance, in New York.

2020 (May 10) - "Trump administration cuts funding for coronavirus researcher, jeopardizing possible COVID-19 cure – 60 Minutes – CBS News"

https://news.sellorbuyhomefast.com/index.php/2020/05/10/trump-administration-cuts-funding-for-coronavirus-researcher-jeopardizing-possible-covid-19-cure-60-minutes-cbs-news/

2020-05-10-news-sellorbuyhomefast-com-trump-admin-cuts-funding-for-coronavirus-researcher-cbsnews.pdf

Peter Daszak is a scientist whose work is helping in the search for a COVID-19 cure. So why did the president just cancel Daszak's funding? It's the kind of politics which might seem ill-advised in a Health & Fitness crisis. President Trump is blaming China's government for the pandemic. The outbreak was first detected in the city of Wuhan. The administration has said, at times, the virus is man-made or that, if it's natural, it must have leaked out of a Chinese government lab. Both the White House and the Chinese Communist Party have been less than honest. And so, in China, and the U.S., the work of scientists like Peter Daszak is being undercut by pandemic politics.

Why it matters that the NIH cancelled a coronavirus research grant

Peter Daszak is a British-born American Ph.D. who's spent a career discovering dangerous viruses in wildlife, especially bats.

In 2003, in Malaysia, he warned 60 Minutes a pandemic was coming.

Peter Daszak in 2003 interview: What worries me the most is that we are going to miss the next emerging disease, that we're suddenly going to find a SARS virus that moves from one part of the planet to another, wiping out people as it moves along.

In the 17 years since that prophecy, Peter Daszak became president of the New York-based EcoHealth Alliance.

Peter Daszak: We're a nonprofit research organization that focuses on understanding where the pandemics come from, what's the risk of future pandemics and can we get in between this pandemic and the next one and disrupt it and stop it.

In China, EcoHealth has worked for 15 years with the Wuhan Institute of Virology. Together they've catalogued hundreds of bat viruses, research that is critical right now.

Peter Daszak: The breakthrough drug, Remdesivir, that seems to have some impact on COVID-19 was actually tested against the viruses we discovered under our NIH research funding.

Scott Pelley: And so that testing would not have been possible–

Peter Daszak: No, it would not.

Scott Pelley: –if it hadn't been for the work that you did with the NIH grant?

Peter Daszak: Correct.

But his funding from the NIH, the U.S. National Institutes of Health & Fitness, was killed, two weeks ago, by a political disinformation campaign targeting China's Wuhan Institute.

On April 14, Florida Republican Congressman Matt Gaetz claimed China's Wuhan Institute had, quote, "birthed a monster." Gaetz is a vigorous defender of the president. He's been under investigation by the House Ethics Committee for allegedly threatening a witness against Mr. Trump and he led a protest to delay impeachment testimony.

Matt Gaetz on "Tucker Carlson Tonight": The NIH gives this $3.7 million grant to the Wuhan Institute of Virology, they then advertise that they need coronavirus researchers. Following that, coronavirus erupts in Wuhan.

There never was a $3.7 million U.S. grant to the Wuhan lab. But, the falsehood spread like a virus, in the White House, and without verification, in the briefing room.

Reporter in White House press briefing: There's also another report that the NIH, under the Obama administration, in 2015 gave that lab $3.7 million in a grant. Why would the U.S. give a grant like that to China?

President Trump: The Obama administration gave them a grant of $3.7 million? I've been hearing about that. And we've instructed that if any grants are going to that area – we're looking at it, literally, about an hour ago, and also early in the morning. We will end that grant very quickly.

That grant was to Peter Daszak's U.S.-based EcoHealth Alliance for disease prevention it does throughout the world. His work was considered so important that, last year, the grant was reauthorized and increased by the Trump administration.

Why it matters that the NIH canceled a coronavirus research grant

Daszak had been spending about $100,000 a year collaborating with the Wuhan lab.

Peter Daszak: I can't just show up in China and say, "Hi, I wanna work on your viruses." I have to do this through the correct channels. So, what we do is we talk to NIH, and they approve the people we can work with in China. And that happened. And our collaboration with Wuhan was preapproved by NIH.

Scott Pelley: What is the theory of the work that you've done with the Wuhan lab?

Peter Daszak: Well, the idea is that we know that viruses that affect people and pandemics tend to come from wildlife. So, our strategy is to go to the wildlife source, find out where the viruses are, and try and shift behaviors like hunting and killing wildlife that would lead to the next outbreak. We also get the information into vaccine and drug developers so they can design better drugs.

The Wuhan Institute is internationally respected. Two years ago, a team from the U.S. Embassy visited. That team sent a cable to Washington, concerned that one lab in the complex had a serious shortage of trained investigators. But the cable, first reported by the Washington Post, emphasized the Wuhan Institute is "critical to future… outbreak prediction and prevention." EcoHealth's work with Wuhan ended one week after Mr. Trump's briefing room pledge, when the NIH revoked the grant.

Scott Pelley: They gave you no reason?

Peter Daszak: They said it was canceled for convenience and it doesn't fit within the scope of NIH's priorities right now.

Scott Pelley: And yet it was a high priority when the grant was reissued in 2019?

Peter Daszak: Yeah it's definitely puzzling. I mean, this grant received an incredibly high-priority score. It was in the top 3% of grants they reviewed. And that's unusual.

Maureen Miller: I was shocked. I was really, really surprised.

Maureen Miller is a Ph.D. epidemiologist at Columbia University who has collaborated with EcoHealth and Wuhan.

Maureen Miller: It stops the research that's essential to understanding where pandemics like the one we're going through, where they start.

Scott Pelley: How often are NIH grants terminated in this way?

Maureen Miller: This is the first one I've ever heard of. When they terminate an NIH grant, and it's not something that's usually taken lightly, it is for cause. There's fraud involved at some level. There is either manipulation of the data, you're putting your participants in harm's way, or your data are fraudulent.

Scott Pelley: And none of those things have been alleged with EcoHealth?

Maureen Miller: Absolutely not. None.

The National Institutes of Health & Fitness, in its mission statement, says it exemplifies "the highest level of scientific integrity and public accountability." But it wouldn't tell us why the grant was cancelled or whether anything like it had happened before. The NIH told us to direct questions about the origin of the virus to the director of national intelligence.

The Chinese Communist Party has also blocked the truth. In the earliest days, the doctor in Wuhan who discovered the outbreak was silenced by local officials. He later died of COVID-19. In February, the Chinese did allow a visit by an international team of experts including American scientists.

White House Coronavirus Task Force Holds Daily Briefing

U.S. Secretary of State Mike Pompeo speaks as President Donald Trump listens during a news briefing at the White House on the coronavirus outbreak, March 20, 2020, in Washington, DC.

President Trump at State of the Union on 2/4/20: We are coordinating with the Chinese government and working closely together on the coronavirus outbreak in China.

Initially, President Trump praised China. But in the following weeks, testing in the U.S. failed to catch up to the need, vital equipment was short, bodies filled refrigerated trailers, and science was continuously challenged.

President Trump at 4/23/20 briefing: Then I see disinfectant, where it knocks it out in a minute, one minute, and is there a way we can do something like that by injection?

As the U.S. led the world in illness and death, the White House moved the focus to the Chinese government.

Last Sunday, Secretary of State Mike Pomepo attempted to resurrect a debunked theory that the virus was man-made in China.

Mike Pompeo on ABC's "This Week": Look, the best experts so far seem to think it was man-made. I have no reason to disbelieve that at this point.

He did have reason. Days before, the director of national intelligence said there was "wide scientific consensus" the virus was not man-made.

Martha Raddatz on ABC's "This Week": Your Office of the DNI says the consensus, the scientific consensus was not man-made or genetically modified.

Mike Pompeo on ABC's "This Week": That's right. I agree with that.

The same day pompeo tried to have it both ways, President Trump repeated the theory of a Chinese lab accident.

President Trump at Fox News town hall: I think they made a horrible mistake and they didn't want to admit it.

The administration has offered no evidence of an accident or genetic engineering. Dr. Elodie Ghedin is studying the genome of the virus in her lab at New York University.

Elodie Ghedin: People have been saying that's an engineered virus. And it's not. And we know that by looking at the genetic information, looking at the code. And the code tells you a lot.

Human-engineered viruses have common and obvious genetic components, including the virus's overall molecular structure called its backbone.

Elodie Ghedin: If a virus had been engineered, it would've used the backbones that we know. And there's none of that in that virus. And let's say it was a brand-new backbone. Well, it wouldn't look like what it's looking like, because we can find every piece of that virus. We can find these pieces in other very similar viruses that circulate in the wild. From the genetic information, it's clearly not an engineered virus.

Elodie Ghedin and most experts believe the virus, officially called SARS-CoV-2, passed from a wild animal into humans, perhaps in the wild animal market in Wuhan. Many early cases were traced to this market and a market like it was where the SARS virus jumped into a human in 2003.

Elodie Ghedin: A lot of these coronaviruses are found in bats. But we haven't found the exact match. We did find a close match in pangolins. It's an anteater. It's a wildlife that's been traded. People, you know, will consume its meat. But they also use in Chinese medicine, its scales.

Scott Pelley: Is there a way to know that this virus, SARS-CoV-2 emerged from the wild into the human population? Or has that not been proven yet?

Peter Daszak: Well, I'm a scientist. And what I do is I look at the evidence around a hypothesis. There is a huge amount of evidence that these viruses repeatedly emerge into people from wild animals in rural areas through things like hunting and eating wildlife. There is zero evidence that this virus came out of a lab in China.

Scott Pelley: Does the Wuhan Institute of Virology, to your knowledge, have this virus in its inventory?

Peter Daszak: No.

Scott Pelley: Why do you say so?

Peter Daszak: The closest known relative is one that's different enough that it is not SARS-CoV-2. So, there's just no evidence that anybody had it in the lab anywhere in the world prior to the outbreak.

Matt Gaetz on “Tucker Carlson Tonight”: I have called on Secretary Azar to immediately halt this grant to the Wuhan Institute of Virology. They have not been honest and at worst, negligent to the point of many, many deaths throughout the world.

Matt Gaetz wears a gas mask on the floor of the House in early March

Dishonest and negligent allegations have now ended EcoHealth’s carefully reviewed research designed to stop pandemics. Representative Matt Gaetz wore a gas mask on the floor of the House to lampoon the crisis. This was back in the beginning of March, weeks before masks were common. Peter Daszak, whose researchers wear masks to shield them from viruses in the wild, says his team is now facing layoffs.

Peter Daszak: This politicization of science is really damaging. You know, the conspiracy theories out there have essentially closed down communication between scientists in China and scientists in the U.S. We need that communication in an outbreak to learn from them how they control it so we can control it better. It’s sad to say, but it will probably cost lives. By sort of narrow-mindedly focusing in on ourselves, or on labs, or on certain cultural politics, we miss the real enemy.

2020 (Sep 03) - ABC News : "As COVID-19 continues, experts warn of next pandemic likely to come from animals"

ByDr. Jonathan Chan andSony Salzman / September 3, 2020, 5:02 AM / Source : [HM001E][GDrive]

Included - **Dr. Tracey S. McNamara (born 1954)** ; **Dr. Peter Daszak (born 1965)**

Millions of deaths each year can be traced back to animal diseases, experts say.

Early cases of COVID-19 are believed to be linked to a live-animal market in Wuhan, China.

Even as the COVID-19 pandemic rages on, experts are warning that the next pandemic could arrive at any moment, and again, it could come from animals. To prevent history from repeating itself, experts say governments need to start investing heavily in pandemic prevention efforts.

That means deploying teams of biologists, zoologists and veterinarians to begin monitoring animals and the people who interact with them -- an army of scientists tasked with stamping out the next deadly virus before an animal disease balloons into a global pandemic.

According to the World Health Organization, approximately 1 billion cases and millions of deaths each year can be traced back to diseases originating from animal populations.

In the past three decades, researchers have found more than 30 bacteria or viruses that are capable of infecting humans. Over three quarters of those are believed to have come from animal populations.

And while the current pandemic may feel like a very rare happening, scientists say the pace of these pandemics is accelerating dramatically thanks to humans' ever-encroaching proximity to wildlife.

Beginning with SARS almost two decades ago and followed by West Nile, Ebola, Zika and currently, COVID-19, many of these pandemics originated with species of bats, and can be spread between people through coughing and sneezing or through insects such as mosquitoes.

"The time between these outbreaks is getting shorter and shorter," said [**Dr. Tracey S. McNamara (born 1954)**], a professor of pathology at Western University of Health Sciences College of Veterinary Medicine.

And it's becoming increasingly clear that these viruses aren't just a threat to our health -- they're also a threat to the global economy.

"We are only able to sustain an outbreak maybe once every decade," said [**Dr. Peter Daszak (born 1965)**], president of EcoHealth Alliance. "The rate we are going is not sustainable."

The COVID-19 pandemic did not surprise McNamara and Daszak. For decades, they, and other scientists, have been warning politicians and the public that wild and domestic animals -- and the viruses they carry -- pose a threat to humanity.

Without proper monitoring and surveillance of these creatures, they warned, we would be ill-prepared to stop a virus from spreading across the globe. [**Dr. Tracey S. McNamara (born 1954)**] was part of the "Red Dawn" group, a now-infamous email chain of top scientists that asked powerful U.S. government officials to mount a more vigorous domestic defense back when coronavirus was still considered a problem confined to China's borders.

And Daszak, who has spent much of his career hunting for the next pandemic-causing virus in bat caves in Asia, saw U.S. government funding for his science slashed back in April.

Perhaps most ominously, a U.S.-funded early-warning system called PREDICT, which was launched in 2009 in response to the H5N1 bird flu outbreak, saw its funding quietly lapse in late 2019. [**Dr. Peter Daszak (born 1965)**], whose group EcoHealth Alliance received some funding from PREDICT, lamented its loss at the time, arguing it's much cheaper for governments to stamp out small outbreaks than try to control a massive pandemic.

But there are some signs now, with the coronavirus pandemic in full swing, that funding to these crucial programs is coming back. PREDICT was granted an emergency six-month extension, and a new program, called Stop Spillover, is slated to launch in October.

And while it may be too late to stop this coronavirus in its tracks, scientists say the threat of the spillover event grows more imminent each year. As our population continues to expand, the interactions between humans and wildlife grow closer and closer. Cutting down forests and altering habitats push animals out of their own homes and deeper into human communities.

Poorly developed hygiene and sanitation systems can make it more likely for germs to build up. With humans and animals living in such close proximity, bacteria and viruses can easily jump from one species to another.

Once people become infected, the increasing interconnectedness of our world makes the spread of the disease easier. People and domestic animals are able

Once people become infected, the increasing interconnectedness of our world makes the spread of the disease easier. People and domestic animals are able to traverse the globe in a matter of hours. Illegal trade of exotic animals can move across borders undetected, carrying with them deadly bacteria and viruses.

"Several epidemiological drivers have been identified that make bacteria and viruses from animal populations suitable to emerge in a susceptible population. These drivers include climate change, industrial development, ecosystem change and social inequality," said Dr. John Brownstein, an epidemiologist, chief innovation officer at Boston Children's Hospital and contributor to ABC News.

So how do bacteria or viruses go from infecting animals to infecting humans?

One of the most common ways is coming into direct contact with the bodily fluids of an infected animal, such as a bat. This includes saliva, blood, urine and feces. Indirectly, people can come into contact with these through soil, plants, in animal habitats or by eating or drinking something that is contaminated.

Mosquitoes and ticks are two animals that are known to easily spread bacteria and viruses, including West Nile and Zika virus. After biting an infected person, mosquitoes and ticks are able to spread the virus to every subsequent person they bite.

According to [**Dr. Tracey S. McNamara (born 1954)**], rabies and plant diseases that can damage crops are the two diseases under surveillance in the United States.

"We don't think about it in the United States as much," said Dr. Christine Johnson, a professor of epidemiology and ecosystem health at the University of California--Davis School of Veterinary Medicine and director of the EpiCenter for Disease Dynamics. "There is a lot of active work to maintain vigilance for diseases. There is currently an outbreak of Ebola going on right now in the Democratic Republic of the Congo."

In Southeast Asia, efforts at identifying emerging diseases are focused on testing for viruses in both animals and people, especially in places where viruses can spill over, or find a new host, such as in humans, explained Daszak.

"We only know how to look for known diseases," said [**Dr. Tracey S. McNamara (born 1954)**]. Her vision is for a disease surveillance system to focus syndromes, a group of symptoms that are known to occur together.

By empowering veterinarians to share their findings with each other, McNamara hopes that this can help experts quickly identify the source of an outbreak before it spreads.

"Future efforts in zoonotic disease surveillance should include strong integration of animal and human agencies of health, including wildlife, agriculture and public health," added Brownstein.

John Daszak is a British operatic tenor. He made his debut with the Royal Opera in 1996,[1] and has performed widely in Europe.[2]

Daszak's father was Ukrainian, and his mother British.[3]

Daszak trained at the Guildhall School of Music and Drama, the Royal Northern College of Music and the Accademia d'Arte Lirica, Osimo, Italy.[1]

Born 1967

Tenor John Daszak to debut at Metropolitan Opera on May 4

by Helen Smindak

NEW YORK – British-born tenor John Daszak, the son of a Ukrainian émigré who settled in England after World War II, will make his first appearance on the Metropolitan Opera stage on May 4.

Mr. Daszak, considered one of the most versatile of Britain's new generation of tenors, will sing the role of Captain Vere in Benjamin Britten's retelling of Herman Melville's shipboard drama "Billy Budd." Appearing with him will be baritone Nathan Gunn as the innocent hero Billy Budd and bass-baritone James Morris as Budd's nemesis.

The three-hour production will be presented again on May 10 and 12.

Mr. Daszak is the nephew of Zenon Dashak (they spell their last names differently), who was a professor of viola and the long-time rector of the Lviv National Academy of Music and taught the celebrated viola player Yuri Bashmet.

His Met debut comes during a season that includes the title role of Zemlinsky's "Der Zwerg" at Munich's Bavarian State Opera, Jim Mahoney in "Rise and Fall of the City of Mahagonny" with the De Vlaamse Opera in Belgium, and Grishka Kuterma in "The Invisible City of Kitezh" with the Netherlands Opera.

A former member of English National Opera, Mr. Daszak has performed frequently with major U.K. opera companies, including the Royal Opera House, Glyndebourne Festival and Welsh National Opera.

Based in London, Mr. Daszak has made many important international debuts – Vienna's Staatsoper, Frankfurt and Hamburg Operas, Opera National de Paris, La Scala Milan and Valencia's Palais de les Arts.

His performance as Loge in "Das Rheingold" won critical acclaim: one reviewer who pointed to his "lyrical, musical, dramatic presence with a voice the timbre of which reminded me of the late, great Gerhard Stolze." Another critic declared that "John Daszak has a flexible, beautiful voice combined with a most intelligent, effortless characterization."

John Daszak

The tenor's career highlights include Aaron in "Moses und Aron," Mephistopheles in "Dr. Faustus" and the title role of "Peter Grimes." He has also sung the role of Zinovy in "Lady Macbeth of Mitsensk" and Prince Golitsin in "Khovanshchina."

A popular concert performer with a repertoire ranging from Mahler and Janacek through Rossini, Beethoven and Verdi, Mr. Daszak has collaborated with such world-renowned conductors as Kurt Masur, Leonard Slatkin and Sir Colin Davis.

His recordings include the role of Loge in "Das Rheingold," conducted by Zubin Mehta, and Pfitzer's "Palestrina," conducted by Simone Young, both on DVD.

Mr. Daszak was born in Manchester, where he studied at Chetham's School of Music and the Royal Northern College of Music.

2013 (Sep 28) - John Daszak: Genesis of a New British Siegfried. An Interview with Jim Pritchard.

Source - [HI000X][GDrive]

John Daszak's performance catches the eye during the current revival of Elektra at Covent Garden even though he is not on stage for very long. However during this season he will face a much bigger challenge when he sings both Siegfrieds in the new Dieter Dorn production of Der Ring des Nibelungen with the Grand Théâtre de Genève to be conducted by Ingo Metzmacher. He is widely considered one of Europe's most versatile tenors. Recent seasons have seen him make many important role debuts – notably as Captain Vere (*Billy Budd*) at the Metropolitan Opera, in the title role in Zemlinsky's *Der Zwerg* in Munich, as the Drum Major (*Wozzeck*) at the Berlin State Opera and his first Siegfried (*Götterdämmerung*) in São Paulo – and he is also a popular concert performer. The interview took place in his dressing room towards then end of the rehearsals for *Elektra* and John talked about his how he was brought up in a home full of music, his time at Chetham's, his training, his career to date and why it is now time to sing Wagner.

What is your background and how did you get interested in music?

My father was a Ukrainian who had ended up in Britain at the end of the Second World War. Thankfully for him he was taken prisoner by the Allies and later released into the community rather than sent back to Ukraine and be dispatched with. He ended up in Manchester where I was born after he married a British woman, she was half Welsh and half English – so technically I am only a quarter English [*laughs*]. So I was brought up here but never really felt I always fitted in. **It was only when I started travelling around I realised why my father was so culturally very different to those around me. In fact, my interest in music comes from both my parents. *My father sang with a famous male voice choir in Manchester called 'Homin' and my mother loved classical music whilst my father was more interested in folk music but there was always recordings of opera to listen to at home.*** Even though I was brought up in a working class family – we were certainly not middle class though we were aspiring to be, not that I knew much about that at the time – I was surrounded by music. **My mother would sing with us a bit too and my older brothers also were interested in some form of music. On my mother's first trip abroad they went to Italy to Arena di Verona and brought back a large cartoon drawing that had been done of her as a diva on the Arena di Verona stage and that hung in our house when I was a child, I still have it somewhere.**

At that time in the 1970s they trying children out with all sorts of different educational things and for me it was musical instruments and singing that I took to. I was playing the violin at five and nagging my parents about getting lessons for it. However when my mother approached a number of teachers about something for me she was told it was far too early and they usually start with a child who is seven or eight – so my mother replied 'Well, what about Mozart?' I thought that was a great answer even if I could never claim to have been a Mozart [*laughs*]! I eventually went to study the violin at Chetham's School of Music that was local and a great move for me, there had been the possibility of sending me to the Menuhin School but that was long way from home and my mother didn't want that because she thought I would suffer – and so would she. I had actually been accepted at six but that was still too early apparently, so I went to Chetham's when I turned seven. There you get a fantastic musical grounding, it's not all just in the theory of music but there are a number of things

you can get involved in such as orchestra, or you could set up quartets. It was a fantastic time for me, I really enjoyed it, partly because I wasn't boarding there as I could live at home and there was none of the trauma about being ripped from my family. One of my greatest influences there was Michael Brewer who has now been found guilty of child molesting incidents and been imprisoned but I knew nothing of this at the time.

How long were you at Chetham's and what did you do there?

I was at Chetham's from 7 to 18 – others have done their whole time there, like me, though not many. At Chetham's they pride themselves on their music education obviously but that is not all they offer. In my time there was something like 350 students and 180 teachers and, of course, it was very expensive but they gave us a good, normal, academic education and that was necessary because a lot of those who left Chetham's never went into music and are now very successful in other fields – so it is not at all a wasted time. Everything happens in tandem: there is a very good academic education and a very high level – and large amount – of extra-curricular musical activities. The day was often very long, though I didn't mind it at the time as I enjoyed it so much. We would have our academic lessons with our music ones in between and we would start at 8am and might go on till 8 in the evening doing things after school. Because there were a lot of boarders there would often be orchestral and other music rehearsals in the evening.

I started on the violin and, if I say so myself, was brilliant when I was seven. However, to be a great violinist you have to practice your technique endlessly and I just hated locking myself away when some of my friends where out playing football. Whilst there I also did quite a bit of singing which was good for me as by the time I was 13 or 14 it was clear I wasn't going to be the world's greatest violinist. You usually go down in stages with the instrument first trying the viola but I went directly to double bass – mainly because they needed bass players and I was so big that I could easily carry the thing [*laughs*]! I played that until I was about 16, yet all the time I was also singing in various choirs or shows. It was when my voice had broken and eventually settled – and because of the influence of all the opera I encountered – that I began thinking I was Pavarotti and started to try and sing everything he sang! I was fortunate to see him once in recital in Manchester and that was quite amazing – I remember my mother paying an awful lot of money for me to see him. So I was playing the double bass and studying singing and learning the piano because if that wasn't your first instrument everyone studied it as their second one. It was a great musical grounding for me and has subsequently meant I can learn music quite quickly and sight-read as well.

How did the move into opera come about?

At 18 I started to audition for music colleges and got into a few but – being 18 – I thought now's my big chance and I would go down to London and hit the opera scene as a tenor [*laughs*]. I accepted a place at the Guildhall School of Music and Drama and studied with Rudolf Piernay but we didn't get on even though he is known as a great teacher. I changed to Johanna Peters in my second year but after a while I thought about giving it all up as I was very disillusioned. As a young student there I had little money and no possibility of getting any. I even tried driving a cab for a few nights but ended up so exhausted it was physically impossible for me to go into college and sing the next day. I thought many times about actually giving up but the college principal said why didn't I go and sing to Joe Ward back home at the Royal Northern College of Music and it was the greatest thing I could have done. He immediately told me I mustn't give up and to come there to give it another year – one year turned into five and I worked with Nicholas Powell. Compared to the Guildhall I found there was more space and a better social life, in London everyone lived so far away and you would rarely meet. I think things are much better now but back then you could never get a practice room and it wasn't really a nice area to mix with your friends – it was the exact opposite in Manchester.

During my time there I auditioned for the Glyndebourne Chorus and I also once auditioned for the Bayreuth Chorus and was so offended when I didn't get in because they had enough first tenors. I was very disappointed because I remember having the distinct feeling 'Everybody's in the Bayreuth Chorus' but I wasn't [*laughs*]! But I did get the chorus job at Glyndebourne which was great because there if they think you are good enough they'll give you covers and they will actually allow you to go on, unlike a lot of places. I started in Mozart in 1991 and did two summers there whilst studying. I covered Števa in *Jenůfa* and some other small roles and was in the *Peter Grimes* chorus – it was all a great experience. Peter Moores, who had helped me out financially during my last two years at the Royal Northern, then gave me a scholarship to go and study in Italy at what was basically a *bel canto*academy – the *Accademia d'Arte Lirica* in Osimo – that he knew about. At the time I was singing a lot of quite lyrical repertoire, a lot of Mozart and songs but lots of people had their own ideas about what repertoire I should do, especially because I am quite tall. I don't have a huge voice but I think it carries well and is big when it needs to be – I also have the ability to learn difficult music and sing it. In Italy we indeed worked on *bel canto* the whole time – and especially lots of Donizetti – but it was good both physically and vocally for me. It benefitted me in other ways because when I came back people said 'You've studied in Italy, you must be great' and so I began to be offered small parts and covers.

What opportunities did you get to show what you could do and how did things go for you at the start of your career?

I guess my biggest one at the time was to cover Števa in *Jenůfa* for English National Opera. Since I had already done that at Glyndebourne I had already learnt the role quite well and everyone told me because of the tenor I was covering I was bound to get a chance to get on stage and sing it. I was quite 'green' at the time and didn't think more about it until I did get the chance to sing a couple of shows which was great fun. I remember meeting the director on the set and she was a bit stressed because a cover was going on in her production but I was fine because I knew the piece and had been rehearsing very well. Mark Elder saw me in that and was impressed and he has been one of those people – in fact, there have been quite a number over the years – who told me I should be singing Wagner. Indeed very early on I went to audition for *La bohème* at ENO after doing a couple of things there and my agent said it was 'a great audition' and 'if they do not give it to you they are crazy' but all they talked about was me doing Siegfried in a new *Ring* cycle – and that was 20 years ago [*laughs*]! So this is the problem singers are up against in a lot of casting situation and they can have fixed opinions. It is easier if you can give them a package they can understand and my problem in a way was that I always had a very varied repertoire because vocally and physically I can do it – also dramatically I love to get involved with my characters and I won't just be standing there and singing. As a result people do not see me in anything specific which can be a bit of a problem sometimes; but can also be great because I get to do a wide variety of things even though I am a getting a little more specialised now as I get older as I am finding I am fitting into a more specific type of repertoire.

How was it for you at the ENO, did singing in English help or harm you career and what happened next?

I enjoyed my time there and, thankfully, I always got a fantastic response as people could hear what I was saying. Singing in English there was important for me because naturally I am keen on communicating when I am singing and performing; I strive for that regardless of the language the opera is in. To do this properly the work begins when I am learning the role. I also try and learn the history of the role and do as much background work as possible. My worst fear is to arrive unprepared, it's just the way I am, but I actually seem to arrive better prepared than many of the others because I want to make the most of communicating to an audience – and, if necessary, move them – by delving into a character both musically and dramatically. As a singer the first thing you must do is make sure you get heard and that people can understand the language. There might be somebody listening who speaks German or Czech or Hungarian, so I am always striving to basically get my words right. I'll do as much work as I have to and make sure it is as realistic as possible and that is what I've tried to do at the two big places I've worked at, the ENO and in Munich – these have been my two 'staple diets' so far even though I worked at lots of other places, including here at Covent Garden a few times.

When I started in Munich I remember the first thing I did there was Alban Berg's *Lulu*. In that there is a significant scene between my character, Alwa, and The Athlete. Naturally it's in German but there were two English guys speaking it for what seemed like 10 minutes – even though it is just probably a minute and a half! There we were on a stage in Bavaria and it was very scary to start with. We worked hard on it and people seemed to enjoy it – in fact so much so, that they came up to me speaking in German immediately as they assumed I could speak the language because my pronunciation must have been good enough. The Athlete was a fine singer called Jacek Strauch and I saw his name before meeting him and assumed he was probably Polish-German but when he came up to me he said in a refined voice 'Hello John' and it turned out he was born in London and spoke better English than I did [*laughs*]!

From what you have said so far you seem to enjoy being a singer.

Like many people I'm very passionate about music and, of course, it is also in my blood. When I was working at the ENO I often made the mistake of saying to my wife 'I've got to go to school – oh, I mean, I've got to go to work' [*laughs*]. It is problem as we can sometimes undervalue what we do and allow people to walk all over us because intrinsically it is a vocational job – you have absolutely love it otherwise you will not survive in it. Nowadays it is not as ridiculously well paid as it was in even as recently as 20 years ago – and I have heard stories of what people were being paid then. When on contract in Stockholm early last century Jussi Björling was on film star money but is nothing like that for anyone now!

How are you enjoying singing Ägisth in Elektra?

I didn't know the piece at all when I was asked to do it though I'd heard how Ägisth is known within the tenor repertoire as being an important role. I opened the score and was fingering through it and trying to find where he was – it wasn't until the last few pages that I found when he appears. It didn't seem much but then I looked on YouTube and saw James King doing it and thought 'Wow'! It's short, high octane and quite important – even if it's only three minutes. He is the turning point for Elektra, she's after vengeance and seeing me brought to justice gives her what she needs – in a way something of a 'release' I suppose. It's not easy to sing, is difficult musically and goes quite high at the end. Ägisth is not like my normal roles when I am on stage the whole time and never get a break – then you have to learn to pace yourself. Here although it is very difficult you can throw yourself into it and in a couple of minutes it is over and you can relax. It is not that easy to cast as you cannot just have anybody doing it. Previously it used to be sung by heldentenors who were later in their careers but now it is often someone of my own age and in their prime who sings it. At the moment we are doing stage rehearsals and there is still blood in the bathroom from where I get killed when trapped in a revolving door by Iain Paterson as Orest [*laughs*].

I'm enjoying working with Andris Nelsons, his beat takes a little bit of getting used to, but he is clearly so passionate about the music and knows every note of *Elektra*. I've watched him on the monitor from backstage and he's really enjoying it which is fantastic and quite inspiring. We've just had a great stage and orchestra rehearsal this morning and he did a few musical notes afterwards. The great thing is that it is not such a long opera and in those rehearsals you can go through half the opera, then go back and work on it again and still have lots of time. Charles Edwards' production is updated and I think is set around the time Strauss wrote it. I have no idea how Ägisth is traditionally done but in this I am basically a pervy letch who has had all the women in the household but can't get Elektra who is winding him round her little finger. He comes in drunk and this can be great for a singer because if you mess up – though I hope not to – you can always say 'I was trying to be drunk and slur it a bit' [*laughs*]. The set is both old and new with something from Ancient Greece, as well as, some modern architecture – it's very decadent, very bloody … and, I think, very exciting. Its powerful stuff even if it can make you feel a little uneasy because the music has this undercurrent all the way through it and only relaxes and lets go of you when everyone is murdered at the end.

You have sung a number of important Britten roles what makes his music so special do you think?

I've sung most of the major Britten roles and he is just perfect for my voice. I never heard Peter Pears live but I have listened to a lot of things he did and his voice was efficient, ringing and carried because it was big. I don't particular like his sound because although he could sing beautifully it wasn't a naturally beautiful timbre; however the placing and phrasing is very similar to mine. I would not say that I find the Britten roles easy because they are always emotionally and physically intense – especially the way they must be performed – but they fit my voice like a glove. So long as I do nothing stupid [*laughs*] I can usually get through them without much trouble at all and, in fact, they are a joy to sing. I think Britten is one of the last *great* opera composers because he knew exactly what he was doing vocally and wrote for specific people. This was lucky for me as he loved music and loved singing, as well as, knew how to orchestrate.

Finally it seems you have decided the time is right to sing Wagner and tackle Siegfried?

Like I said before the jury's been out on what sort of repertoire I should do at this stage of my career. I avoided Wagner for many years even though I had been told many times 'You would be a great Siegfried' and similar encouraging things about him. Truthfully, I never really enjoyed Wagner and had always thought of myself as a heavy, high, lyric tenor that could do a lot of repertoire and I knew how once you start singing Wagner it is often quite difficult to turn the train back – you can jump off but can never really turn it around [*laughs*]. Then Zubin Mehta wanted me for Loge in Valencia – and although that character is nothing like Siegfried – it got me into Wagner in a quite low pressure way. I was able to hang out with Wagnerian singers and see what type of animal they are and what they have to sing. I have listened to rehearsals of both *Siegfried* and *Götterdämmerung* even though I was not in them.

My *Rheingold* was an interesting experience, I remember we were rehearsing on stage one day and Loge was supposed to be having an intimate conversation with Wotan and the director separated far apart. We couldn't understand this but next day there was this huge screen between us and we realised had we been together we would have just been in the way of his high definition projector [*laughs*]. I had the added advantage of being on a Segway with a ridiculous costume over it and I could manipulate myself into whatever position I needed to sing. It all looks glorious on the DVD and was great fun for me as my first taste of Wagner. As for Siegfried, I was approached by someone who used to direct here at the Royal Opera House, André Heller-Lopes, who was on the Jette Parker Young Artists programme and assisted on a lot of shows including Thomas Adès' *The Tempest* I sang in here. We had got quite friendly and he was also one of those people who said I could sing Siegfried. Now he is back in Brazil and doing a lot of productions there, he asked if I was free and interested to sing *Götterdämmerung* in São Paulo. I thought it would be good to try it out there with someone I trusted and a very experienced Brazilian conductor, Luiz Fernando Malheiro, and we had a great time. I'd been told it was a scary part but I thought what's so scary about this? Of course, there are a couple of notes that are awkward – but I love to get my teeth into that sort of music. The character is almost written for me, he is youthful, naïve, a bit childish, hates injustice and gets dumped on by everybody in the end – almost the story of my life [*laughs*]!

I've always been brave and willing to take things on and do them so it's going to be very interesting. My only other Wagner roles so far is Erik – that I recently sang for the first time in Sydney – and that was surprising for me as its really like Mozart. It is quite high and very lyrical and needs a certain resonance and sound but is beautifully written music – a bit like *Lieder* but heavier. I enjoyed Erik, he is a passionate lover who makes a good foil for the Dutchman. I worked on both Siegfried roles just to check them out and see if I could sing them and then I went to sing something from them to Ingo Metzmacher who will conduct the *Ring* in Geneva. After we worked on some things, he also asked me if I was scared of this role as it was one tenors are usually afraid of. Scared of what? I believe I have sung much more dramatic roles and much heavier ones. Time will tell but I think if you singing Siegfried in a

classical style it is much lighter and much less harmful to the voice than a lot of the things I have sung. I remember Mark Elder – who was trying to persuade me to do some Wagner with him and the Hallé -saying 'You know Alberto Remedios sang it so lyrically and beautifully'. It'll be an interesting time because obviously once a singer starts singing Siegfried there is a focus on you and I'm sure people are waiting around to see how it all goes for me.

Lesson 68 [...] : Z. DASHAK

In October 1951 Zenon Olexiyovych Dashak (1928 - 1993), who ,vas teaching the viola class , entered the post-graduate course at Kyiv Conservatoire . The musician was born in the town of Striy of Drogobych region , Lviv oblast' . He studied at Lviv Conservatoire (1946-1951), which he graduated from as an "orchestra soloist , teacher of viola class '. From 1949 till 1951 he taught in 'Lviv (viola player of the symphonic orchestra ofLviv Philharmonic Society, the teacher of viola and quartet in L viv S. A. Krushelnitska 's secondary special musical school) . Since 1951 he ,vas the post-graduate student at Kyiv Conservatoire at V. Goldfeld's class. In 1955 Z. Dashak defended a thesis on the topic: "Chamber Instrumental Compositions and M. Lysenko 's Performance Activity". Since 1961 he had been an associate professor, since 1962 ,vas the head of the Chair of Bow Instruments , since 1963 - pro-rector on the scientific and academic works of Kyiv Conservatoire . In 1961 Zenon Olexiyovych was awarded the order "Znak Poshany ' ("The Sign of Respect') . Till that time he had written and published over 30 scientific and scientific -methodical works , had concerts of I. Khandoshkin and G. Handel, made many editions and workings for viola. Except for intensive scientific pedagogical and administrative -social activity , the talented musician continued pe1forming . So, for example , he performed in the teachers' quartet of Kyiv State Conservatoire (P. Makarenko , V. Stetsenko , Z. Dashak , V. Chervov) . In 1965 Zenon Olexiyovych moved to Lviv because of his appointment as a rector of Lviv Conservatoire .

Among the students of the Honoured Art Worker of Ukraine Candidate of Arts Professor Z. Dashak , there are : Yu. Kholodov (laureate of the International competition of quartets in Budapest , 1963 the II prize , Honourary Artist of Ukraine , associate-professor); A. Venzhega (winner of the All-Union competition of viola players , 1963 laureate of the Republican competition of the young performers , 1969, Honourary Artist of Ukraine , an associate professor); B. Shchutskyi (Honourary Artist of Ukraine an associate professor concertmaster of iola players ' orchestra of the National Opera and Ballet House of Ukraine); Yu. Zolotarenko (the performer of the National Opera and Ballet House's orchestra of Ukraine); D. Gavry lets (associate professor of P. I. Tchaikovskyi NMAU, Honoured Art Worker of Ukraine) and others.

IF this is the same person (also his uncle), it means only some of the Daszak family went to Britain after WW2...

Dashak, Zenon Alekseevich

Zenon Alekseevich Dashak (July 17, 1928 , Stryi - June 26, 1993 , Lviv) - Ukrainian musician, composer, rector of the Lysenko State Conservatory of Lviv (1965-1992), Honored Artist of the Ukrainian SSR (1970), professor (1971), teacher, music and public figure, founder of the Ukrainian alt school.

Biography

Born July 17, 1928 in the city of Stryi (now the Lviv region) in the family of a railway worker.

From 1946 to 1951 he studied at the Lviv State Conservatory named after N. Lysenko in the class of Professor Pavel Makarenko; then - at the graduate school of the P. Tchaikovsky Kiev State Conservatory (1951-1954, now the P. I. Tchaikovsky National Music Academy of Ukraine), where he defended his dissertation on the theme: "Chamber-instrumental works and performing activities of N. V. Lysenko." Remained to work at the conservatory. He went from a senior teacher, assistant professor - to the head of the department of stringed bowed instruments (1961) and vice-rector for academic and scientific work (1963-1965). At that time, prominent cultural figures of Ukraine worked at the Kiev Conservatory: B. Lotoshinsky, L. Revutsky, I. Patorzhinsky, N. Rakhlin, V. Stetsenko, M. Donets, Z. Gaidai, A. Parkhomenko, A. Gorokhov, V. Chervov, A. Manilov, R. Lysenko and others.

In Kiev, Zenon Dashak performed as part of a string quartet with musicians: A. Gorokhov, S. Kravtsov and others.

In 1965, Zenon Dashak was appointed to the post of rector of the Lviv State Conservatory named after N. Lysenko. In the conservatory, he created a string quartet, whose participants besides him were Alexander Derkach, Bogdan Kaskiv and Harit Kolesa. With this composition, musicians performed for several years in the cities of the USSR and abroad. Subsequently, the national artist of Ukraine, professor Lidia Shutko , musicians Tatyana Shupyana, Tatyana Sirotyuk, laureate of the Taras Shevchenko National Prize Yuri Lanyuk played in this group. The partner in the quintet was the pianist and people's artist of Ukraine, Professor Oleg Krishtalsky.

During Dashak's work as a rector at the conservatory, performing contests were held (All-Union violin, viola, double bass, harp specialties; All-Ukrainian N. Lysenko pianists and conductors competitions), scientific conferences, meetings. Dashak was a member of the jury of all-Ukrainian and all-Union competitions, numerous international: in France, Germany, Georgia, Romania, Lithuania, where he collaborated with musicians such as: L. Kogan, A. Khachaturian, V. Borisovsky, S. Zenaker, V. Taktakishvili, I. Bezrodny, M. Rostropovich, S. Tsintsadze, A. Sveshnikov, F. Druzhinin, V. Dulova, V. Klimov and others.

At different times, Zenon Dashak was the chairman of the Lviv branch of the Ukraine society, a member of the presidium of the Lviv Culture Fund, the T. G. Shevchenko Ukrainian Language Society and others.

From 1981 to 1993, Dashak conducted pedagogical activities in Lviv. He headed the department of stringed bowed instruments (viola, cello , double bass , harp) at the conservatory, trained more than thirty violists: G. Freidin, I. Fertser, Yu. Zhenchur, S. Kalinovsky, D. Komonko and others.

Zenon Dashak is considered the founder of the Ukrainian alt school, his graduates work in music schools and concert and theater institutions in Ukraine and abroad. The teacher is the author of more than 40 works on the problems of musical performance, 15 collections of pedagogical repertoire for violin and viola, collections of exercises and studies, a number of processing and translations for viola; wrote "Ukrainian Suite" and "Variations" for violin (viola) and piano.

Zenon Alekseevich Dashak died June 26, 1993 in Lviv, was buried in the city of Stryi.

Family

Zenon Dashak was married. Wife, Anna Yuryevna Dashak - Honored Artist of Ukraine, writer, singer, professor at the Lviv State Conservatory named after N. Lysenko named after N. Lysenko. His son Bogdan - a famous conductor, works at the Lviv National Music Academy. N. Lysenko, daughter Irina - pianist, works at the National Music Academy of Ukraine named after P. Tchaikovsky in Kiev, the grandson of Eugene - pianist and clarinet player, works there.

Bohdan Dashak will perform in the Transcarpathian Philharmonic

6 March 2017 18:30 - 6 March 2017 20:30 41 0

He is the successor of the famous musical family. **His mother Anna Dashak (born in the village of Nevytske is Uzhgorod district) is a famous singer (soprano), Honored Artist of Ukraine, a former soloist of the Kyiv Philharmonic and the Lviv Opera and Ballet, professor of solo singing department of Lviv Music Academy, writer. Father, Zenon Dashak, was a known musician, composer and philanthropist, rector of the Lviv State Conservatory (1965-1992), Honored Artist of Ukraine.**

Bohdan inherited from parents all their generous talents. A brilliant opera and symphony conductor, assistant professor of Lviv Music Academy, he has performed in Uzhgorod many times with classical programs. And in November last year, Bohdan Dashak made a real gift for Transcarpathians: together with the Symphony Orchestra of the Transcarpathian Regional Philharmonic, he performed world-famous jazz hits.

Uzhgorod audience liked it so much that on March 6, at 18.30, Bohdan Dashak and the Symphony Orchestra of the Transcarpathian Regional Philharmonic invite music lovers to another concert. The program is entitled "Rose of Love". The concert will feature popular jazz standards, world hits, songs by EL Webber, M Legrand, S Wonder and others. Conductor - Honored Artist of Ukraine Victoria Svalyavchyk-Tsanko. The event will be hosted by the music historian Natalia PITSUR.

Yard reopens inquiry into former Nazi soldiers still alive in Britain

· Labour MP insists search sends important message

· Researcher believes police hunt is 10 years too late

Fri 3 Feb 2006 19.12 EST

Scotland Yard has relaunched its search for war criminals almost seven years after its specialist Nazi-hunting unit was disbanded, the Guardian has learned. An eight-strong team from the anti-terrorist branch has been examining the backgrounds of British residents suspected of committing atrocities during the second world war.

The team is focusing on former members of a division of the Waffen SS which was recruited by the Nazis in the Ukraine and brought to Britain en masse to provide farm labour after the war. Home Office officials believe several hundred former members of the unit may still be living in the UK. The Guardian has identified and located more than a dozen survivors of the Galizien division. Most still live in small clusters in the East Midlands, Yorkshire and East Anglia, a short distance from the PoW camps where they arrived almost six decades ago.

\The new inquiry has been shrouded in secrecy since it was quietly resumed last year, and the Yard has even attempted to deny that it is under way again. Two senior officers have been assigned to lead the team of two detective sergeants, two detective constables and two civilian researchers. A Yard spokesman confirmed that they are scouring old war crimes files and "liaising with other government departments, including the Immigration and Nationality Directorate, to establish the best way forward".

It is unclear whether statements have been taken from the former members of the unit, the **14th Waffen SS Galizien division**. Scotland Yard is also declining to say whether any witnesses have been located in Poland, Slovakia or the Ukraine, the countries where the Galizien division operated, and where some members stand accused of participating in the massacre of Jewish and non-Jewish civilians.

Police are understood to be attempting to identify members of the Galizien division who attended a training centre for concentration camp guards as well as

examining the war records of other surviving members. With the youngest former members of the unit now in their 80s, however, and with the memories of surviving witnesses fading fast, the chances of any successful prosecutions appear slim. The decision to relaunch the hunt is thought to reflect a renewed appetite for war crimes investigations at the Home Office, and comes after continuing calls for action from a number of backbench MPs.

Investigation

However, it is unclear how much enthusiasm there is at Scotland Yard for an investigation that could divert detectives from anti-terrorist duties at a time of mounting security concerns.

The Yard's specialist war crimes unit was disbanded in May 1999 after investigations costing an estimated £6.5m resulted in just one conviction. Anthony Sawoniuk, a retired railway ticket inspector from south London, was jailed for life earlier that year after being convicted of two specimen charges concerning the murder of 18 Jews. He died in Norwich prison last November, aged 84.

Andrew Dismore, Labour MP for Hendon, who has been pressing for action against surviving war criminals, said the Yard deserves extra funding for the inquiry. "Making sure old war criminals can never sleep easy in their beds sends an important message to the would-be war criminals of tomorrow," he said.

Trial

But Professor David Cesarani, who was the principal researcher for the group of MPs which campaigned successfully for the introduction of the War Crimes Act 15 years ago, believes that men who could have been prosecuted at that time are now highly unlikely to face trial. "This has come 10 years too late," he said. "The Home Office should be asking whether this is going to do more harm than good, and whether embarking on a judicial process, which will take years to come to fruition, is the best way to proceed. Regretfully, it may be that an inquiry by government historians will now be the best way to investigate what these people did, how they came to be here and why they have not been prosecuted before."

Hitler's Ukrainian SS division was created from the merger of many different units, including the Nightingale battalion, said to have participated in the massacre of thousands of Jews in Lvov, Ukraine, and the Ukrainian Self Defence Legion, accused of murdering villagers in eastern Poland. Some Galizien troops are said to have played a part in the bloody suppression of the 1944 Warsaw uprising, while others are alleged to have murdered a number of British and American airmen who were being sheltered by partisans in Slovakia. Its soldiers were Ukrainian nationalists, who later insisted that they had no love for Germany or the Nazis, but joined the German army to take up arms against the Russians, and against communism. Those who survive in Britain today deny any involvement in war crimes.

Few people noticed when they arrived in Britain in May 1947: one Labour MP, Barnett Janner, complained bitterly in the Commons that members of the Galizien division "murdered hundreds of people in cold blood", while a solitary letter in the London Evening News, signed with the correspondent's concentration camp number, 3399, complained that he or she had witnessed first-hand the "brutal, uncouth and bloodthirsty" behaviour of Ukrainian guards. Most newspapers devoted just one paragraph to reporting the division's arrival, however. The men were dispersed among PoW camps. Over the next three years just eight "undesirables" were deported to Germany, while some emigrated to Canada, the US or Argentina.

Parachuted

A handful are now known to have been recruited by MI6 and parachuted back into the Ukraine, where they were betrayed by the double agent Kim Philby. Most remained in the UK, however, and were granted civilian status. Many married, started families and, by the 1990s, those who survived were British subjects.

Among the survivors of the Galizien division identified by the Guardian is Mykola Lehkyj, 84, who says he volunteered to fight for the Germans after they overran his home town of Rohatyn, in western Ukraine, in 1941. Although both his brothers served in the Red Army, Mr Lehkyj, then aged 19, volunteered to join the Ukrainian unit that the invaders were raising. "**We hated the Germans, but we wanted to fight the Russians more than anything,"** he said. "The Germans allowed us to make a Ukrainian army in German uniforms. Our aim was to join this Ukrainian army and create a Ukrainian nation." **[NOTE - Proof of youth joining ...]**

After training in Germany, he fought with the rest of the **Galizien division at Brody,** where it suffered heavy losses. "We couldn't hold them. But fighting against the Russians was a pleasure, to be honest with you, because I was fighting on my own land."

Mr Lehkyj was then sent to Slovakia, where he fought partisans, and ended the war as a corporal. He remains proud of his service - "I have nothing to hide" - but denies that he took part in, or witnessed, any war crimes. "The Russians tried to blame us for everything. They say we killed children and women - it isn't true."

After being shipped to Scotland he was sent to a prison camp near Braintree, Essex, to work on farms, and has remained in the region ever since. Today he lives in Ipswich with Helen, the Englishwoman he married in 1953. They have four children, one of whom served in the RAF, and six grandchildren.

"I love this country," he said. "It gave me life. I call it Merry England: this is a country that will help any bugger."

Backstory

Labour shortages in post-war Britain were so severe that few questions were asked when Hitler's Ukrainian soldiers were shipped here. With large sections of the British population still in the armed forces, most farms depended on German prisoners of war, despite forced labour being prohibited by the **Geneva convention**

The 8,528 officers and men of the **14th Waffen SS Galizien division** had been languishing for two years at a prisoner of war camp near **Rimini**, on Italy's Adriatic coast.

Attempts to identify war criminals among them were promised by the Foreign Office, but they had had so much time to prepare cover stories that **Fitzroy Maclean**, a war hero and Tory MP who had been handed the task, complained that it was hopeless. He warned Whitehall: "We only have their own word for it that they have not committed atrocities or war crimes."

Advertisement

All concerns about the unit's war record were brushed aside during a series of cabinet meetings in March 1947. Foreign Office minister **Hector McNeil** reported that "United States opinion was sensitive" about continuing use of Germans as farm labourers.

Mr McNeil conjured up a deft solution: to meet the demand for labour by using displaced Ukrainians in place of the German prisoners. When Home Office

officials complained that immigration rules were being waived to bring suspected war criminals into the country, they were told that the prime minister, **Clement Attlee**, had "decreed" that it must happen.

"What I love about my work … is that it gives me the privilege of spending time with people whose jobs are so interesting, whose work is so important, whose brains and bodies are so tough. I've said it before … but some people, you know, admire medical missionaries, firemen, astronauts. I admire field biologists."

"I have a great job because I get to call up some of these scientists and say 'Hey, can I come talk to you or, better still, can I go to the central African forest with you?' And frequently they say: 'Well, all right, yes.' So that's a kid in a candy store…"

"What experts think of my book is also very important to me. If you're nodding as opposed to shaking your heads … it's very gratifying." (David Quammen, 2013)

Pale Horse. Thirteen Gorillas. Dinner at the Rat Farm. Going Viral.

Chapter titles like these are hard to resist. So here's a confession: I was first drawn to "*Spillover: Animal Infections and the Next Human Pandemic*" by its language and story-craft. Then I discovered its eclectic mix of history, ecology, research, and yes, even math–plus its frank, conversational voice. At that point, I was hooked.

After David Quammen's latest book was published last fall, *New York Times* critic Charles McGrath penned his own panegyric entitled: "The Subject is Science, the Style is Faulkner."

McGrath was referring to Quammen's early days as an English major and a Rhodes Scholar, when the aspiring author immersed himself in Faulkner. Soon, Quammen had published four novels. Then came his shift to non-fiction which, he realized, could be "wondrous and imaginative, shapely and literary … [not just] explanatory."

Quammen moved to Montana and wrote a long-running column for Outside magazine followed by regular features for National Geographic and other periodicals. Today, his bibliography includes 10 science books, including "*Song of the Dodo: Island Biogeography in an Age of Extinctions*" (1996), "*Monster of God: The Man-Eating Predator in the Jungles of History and the Mind*" (2003), and "*The Reluctant Mr. Darwin: An Intimate Portrait of Charles Darwin and the Making of His Theory of Evolution*" (2006).

Earlier this year, I spent an hour talking with David Quammen. In a moment, I'll share excerpts from our conversation. But first, meet "*Spillover*."

Tracking The "Next Big One"

Since its release, readers and reviewers have flocked to "*Spillover*" like flies to carrion, if you'll pardon the scabrous image. Or, to milk the metaphor: like buzzing green-bottles to a still, viral victim in a far forest glade.

There's no denying our 21st century fascination—both mordant and self-protective–with emerging, zoonotic infections. My epiphany came while reading Karl Taro Greenfeld's book on SARS. In my *Los Angeles Times* review of "*China Syndrome: The True Story of the 21st Century's First Great Epidemic*," I tried to depict the fragile boundaries between human, animal, and viral wildlife.

"Picture Guangdong province, circa 2002—land of luck and prosperity," I began. "'To get rich is glorious,' Deng Xiaping had proclaimed years earlier, opening the door to a new era of enterprise. Now, in China's south, music blares, cell-phones ring, cigarette smoke curls, and tycoons flush with cash consume every kind of exotic meat from camel hump to pangolin ear. The growing passion for 'Wild Flavor' cuisine has spawned a flourishing trade. In crowded warehouses, slaughter chambers, and restaurant kitchens slimy with entrails and excreta, hundreds of caged creatures destined for affluent diners nervously await their fate."

"Welcome to the riotous breeding ground of severe acute respiratory syndrome, an infection that will soon species-jump from animals to people."

Quammen lures readers with interlocking characters and sub-plots in the SARS drama. To name a few: fish merchant Zhou Zuofeng, the original "Poison King" "super-spreader" of the novel coronavirus. Brenda Ang, the infectious diseases consultant who saw many SARS sufferers (both patients and healthcare workers) at Singapore's Tan Tock Seng Hospital. Esther Mok, Dr. Ang's index case, who contracted her illness at Kowloon's benighted Metropole Hotel and subsequently infected her father, mother, uncle, and pastor—all of whom died.

Quammen then narrates the race to identify the SARS agent and its (still) elusive reservoir host. Finally he joins Aleksei Chmura, an American virus hunter-cum-global gourmand. As a prelude to their fieldwork, the two men bond over clotted pig's blood, bean sprouts, red peppers, and drippy globs of durian, "the world's stinkiest fruit." Then it's off—minus protective respiratory gear–to netting bats in the karst mountains near Guilin and later phlebotomizing them. Wrapping the chapter is an excursion to a cinderblock billet in southern China where Farmer Wei Shangzheng raises placid bamboo rats headed for human dinner plates.

"They breed readily, Mr. Wei, explained. He kept mostly females, plus a few good studs. Last month he sold two hundred rats, and now he was expanding his operation, building new sheds. Already he was the largest bamboo rat farmer in southern China! He told us exuberantly. Southern China, yes, and maybe beyond! He stated this not to brag, it seemed, but in joyous amazement at the vagaries of fortune. Business was good. Life was good. He laughed—ha ha ha!—at the thought of life's goodness. He's famous! He told us. He had been featured on Chinese TV! We could Google him! His ventures in bamboo-rat husbandry began in 2001, when he lost his job at a factory and decided to try something new.

The rat meat was mild, subtle, faintly sweet. There were many small femurs and ribs. One eats bamboo-rat hocks with one's fingers, I learned, sucking clean the bones and piling them politely on the table beside one's bowl, or else dropping them on the floor (the preferred method of Mr. Wei's father, a shirtless old man seated to my left) where they would be scavenged by the skinny cat who slept under the table. The hotpot was scorching. Mr. Wei, an exemplary host, brought out some big bottles of Liquan beer. Guilin's finest brew, nicely chilled. After a few glasses, I got into the spirit of the meal and found myself turning back to the rat platter, browsing for choice morsels.

I had begun to see Aleksei's point: if you're a carnivore, you're a carnivore, so what's the merit of fine distinctions? And if you're going to eat bamboo rat, I figured, best to do it here, at the source—before the poor animals get shipped, stacked amid other animals, and sick. Wild Flavor doesn't need to be seasoned with virus."

I've included this passage in its entirety because of its humanity, humor, and unexpected tag-line. Could the same information be packaged in dry, technical prose? Of course–and many of us would be just as enthralled. But not, necessarily, general readers. Lest we forget: it is they who must ultimately grasp 21st century disease ecology, then make savvy, possibly life-and-death choices.

Enough editorializing. It's no easy task to summarize "*Spillover*." For now I'll simply state that the book brims with engrossing human tales, field investigations, and "direct-to-camera" riffs around Hendra, Ebola, malaria, Q fever, psittacosis, Lyme disease, Herpes B, Marburg, Nipah, HIV, and avian flu, among other zoonoses. The book also introduces George MacDonald's model of malaria transmission and Australian scientist Frank MacFarlane Burnet's insights about certain shortcomings of a classical medical education. Burnet published "*Biological Aspects of Infectious Disease*" after recognizing that MDs trained in the first half of the 20th-century often lacked knowledge of zoologic and environmental factors contributing to human infections. Drawing on contemporary field research, Quammen marshals evidence that fragmented and disrupted ecosystems—as opposed to intact and diverse ones–are the settings most vulnerable to modern-day spillovers.

Quammen Un-Censored

"Let's start with the braided structure of the book. I found it fascinating."

"I don't like books that are structured in obvious, programmatic ways. The last thing I wanted was to write a book that simply covered nine diseases and marched predictably through them. So [in addition to disease-by-disease treatment], the history and principles of disease ecology are two more cords. My quest to go around the world to see and learn as much as possible is the fourth thread."

"I was also struck by the humor and empathy of your writing. Where does that come from?"

"As a writer, humor is one of those things you don't want to think about too much, but I suppose I was always kind of a smart aleck … At the same time, I'm not a hard-nosed journalist; I'm some other kind of non-fiction writer. When I go into the field, it's very hard for me not to like people. Especially if they are unpretentious people like the bamboo rat farmer in China."

“What's your view on our modern-day empathy for animals?”

“There's certainly a tension between concern for animals at the population and species level and concern for individual animals. That's something I'm interested in and have written about. I tend to think that animal rights people and conservationists are natural allies … but in a lot of cases the best thing for the population status of a species is not the best thing for individual animals.”

“I also have empathy for plants … I had a recent *National Geographic* assignment climbing the world's second-largest sequoia tree. I had enormous empathy for that creature once I got up into its crown.”

“Do you have empathy for viruses?”

“Aah, that's the sharp edge of the wedge. That's a difficult one.”

“What about bats—considering the deadly viruses they sometimes carry?”

“In the course of researching the book I spent time with bats, helping people like John Epstein and Aleksei Chmura trap and handle them, look for bat-roosts. It gave me more empathy. The one thing I regret [in “*Spillover*”] is that I didn't more clearly and explicitly say: ‘Look, dear readers, do not demonize bats. Bats are enormously important and perform important ecosystem services.’”

“What are your thoughts about eradicating infectious diseases?”

“There's an absolute-ness about eradication that I distrust, that makes me uneasy … In the case of zoonoses, of course, we can't eradicate unless we cure or eradicate the reservoir host. We don't want to pave this entire planet to make it cleaner and safer for humans because it will be not only un-helpful, it will be boring, lonely, and ugly.”

“I do have sympathy for people who say: we've eradicated smallpox from the human population, now let's eradicate polio. How can you not be in favor of that? But zoonoses are much more complicated. As Rick Ostfeld [of the Cary Institute of Ecosystem Studies in Milbrook, NY] once said to me: ‘Infectious disease is inherently an ecological system.’”

“What was your scariest moment researching the book—and your most poignant?”

“The scariest moment was when–about a-third into it–I started waking up in the middle of the night thinking: how am I going to do this? I've signed a contract; my editor and my agent are counting on me to deliver an encyclopedic and entertaining treatment of zoonotic diseases, including AIDS and Ebola. How in the world am I going to get access? Then, someone said: ‘Do you want to go with me to southern China and look for SARS?’ ‘Do you want to go to Bangladesh and draw blood from macaques?’ … and the moment passed. Then it was just a matter of, well, don't fall off the roof.”

“The most poignant moment was when I went back to that village in the Congo with Prosper Balo and he told me the story of when Ebola struck his village. Balo [an expert gorilla tracker] was off working in the forest where gorillas were dying; meanwhile his wife [whose sister, two brothers, and child died of Ebola] was being shunned, people wouldn't touch her money, wouldn't sell things to her. He lost members of his gorilla family; then he went back to his compound where he lost members of his human family. At that moment I thought: here is a complete human being. And I am completely interested in his story.”

“What do you say when people ask you to predict the “Next Big One”?”

“I try to say what I say in the last chapter. It's more complicated than that. Yes, there is a possibility but not an inevitability that a pandemic will kill millions or tens of millions of people. But it's also possible we can control or avert that.”

“People need more information to make intelligent choices. One reason I wrote the book … [is to] improve decision-making. We have to keep fighting the battle of getting people vaccinated for flu just as we have to keep fighting the battle to prevent people in Bangladesh from drinking raw date palm sap [and getting Nipah virus].”

“My book is not a haiku, it is not a street sign, it is not even an op-ed … it's a 500 page book. I don't think of it as a strident alarm bell. I think of it as a nonfiction concerto on a very, very important field of science.”

ASTMH Confidential

Several times during our conversation, Quammen reiterated his debt to the scientists who helped him complete his “concerto.” Not surprisingly, “*Spillover*'s” back-matter is packed with names, including those of *ASTMH* members.

Quammen first met Jens Kuhn at a filovirus meeting in Gabon. “Actually, we were both staying at the same fringe hotel outside Libreville,” Quammen clarified; while traveling back and forth on the bus, the two men hit it off. Would Kuhn read a draft of his Ebola chapter? the writer asked. In exchange for a bottle of single-malt scotch (he declined a case), Jens reviewed the entire manuscript.

Another reviewer was Charlie Calisher, whose 2006 review article, “Bats: Important Reservoir Hosts of Emerging Viruses,” figures colorfully in a chapter entitled “Celestial Hosts.” Quammen describes Charlie as “… a smallish man with a dangerous twinkle, famed throughout the profession for his depth of knowledge, his caustic humor, his disdain for pomposity, his brusque manner, and (if you happen to get past those crusts), his big, affable heart.”

Finally, Karl Johnson. “Tremendously good company and such a silverback in this field,” Quammen said of his fellow Montanan and fly fisherman. Karl not only briefed Quammen on Machupo, Ebola, hantavirus and other ‘special pathogens’ studied at Johnson's former CDC branch, he set the record straight on tumid features of Ebola promulgated by Richard Preston's “*The Hot Zone*.” “Bloody tears is bullshit. Nobody ever has ever had bloody tears,” our past-President declared, adding “People who die [of Ebola] are not formless bags of slime.” (To his credit, Preston accepted the knuckle-rap with evident grace in his *Wall Street Journal* review of “*Spillover*.”)

After we spoke, I mailed Quammen a copy of *ASTMH's* Karl Johnson video. I also threw in a reprint of “*Infectious History*,” Joshua Lederberg's prophetic essay published in 2000. In a section titled “Evolving Metaphors of Infection: Teach War No More,” Lederberg argues for moving beyond the traditional allegory of “microbe v. man” (or, to paraphrase the Nobel laureate microbiologist: the manichaean “We good; they evil” view). Re-reading Lederberg, I found echoes of Quammen, whose final chapter offers this thought on the “salubrious” side of zoonotic diseases:

“They remind us, as St. Francis did, that we humans are inseparable from the natural world. In fact, there is no “natural world,” it's a bad and artificial phrase.

There is only the world. Humankind is part of that world, as are the ebolaviruses, as are the influenzas and the HIVs, as are Nipah and Hendra and SARS, as are the chimpanzees and bats and palm civets and bar-headed geese, as is the next murderous virus—the one we haven't yet detected."

Or, as Quammen reflects after Prosper Balo shares a treasured notebook listing the names "Apollo," "Cassandra," "Afrodita," "Ulises," "Orfeo," and other Ebola-felled apes: "People and gorillas, horses and duikers and pigs, monkeys and chimps and bats and viruses: We're all in this together."

Davison Chemical Company

Draft. ...

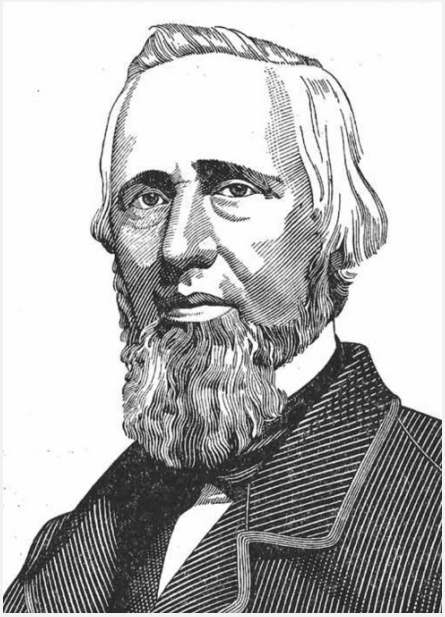
From scanned copy of (1951) "Davison Chemical - It's background and Contributions since 1832"

From scanned copy of ***(1951) "Davison Chemical - It's background and Contributions since 1832"***; (See [aa1][GDrive]).

The story of Davison goes back about [nearly 200 years as of 2019], and it is largely a record of development around **sulfuric acid**. [...]

Early in the 18th Century, about 1736, the first commercial sulfuric acid was produced at Richmond, England, by a Doctor named **Joshua Ward**, who was of doubtful character but of very considerable ingenuity, considering the status of the chemical science and the art of manufacture in his day. Ward set up glass containers or vats of up to 66 gallons capacity in two rows in a sand bath, each container provided with a little water. The containers resembled so many fat geese, with long, thin necks reaching into earthen pots. Each pot rested on a red hot dish and contained a mixture of one part saltpetre and eight parts brimstone. The process was controlled by wooden plugs in the bottles. When fresh air was admitted, the reaction started up, and the process was repeated until the acid reached a standard strength. The Ward method was known as"oil of vitriol by the bell." John Roebuck, another Englishman, in 1746, led the way to improvements in the process with his lead ‑ condensing chambers. Methods of manufacture during the rest of the 18th Century varied little after Roebuck's useful modification.

Here in the United States of America the first sulfuric acid manufacture was undertaken at Philadelphia, in 1792, by **John Harrison**. He used the lead chamber process and, by 1807, had an annual capacity of a half million pounds of acid. **Harrison is credited with being the first to use platinum in the manufacture of sulfuric acid.**



[aa2][GDrive]
WILLIAM T. DAVISON (circa 1804-1881)

William T. Davison [...] was born in Belfast and educated at the University of Belfast, where he majored in chemistry. His father was a well-to-do Belfast merchant, but the younger Davison ignored the easier opportunity of success at home for adventure abroad, and, in 1825, he left Ireland with his new bride and crossed the Atlantic on a sailing vessel, arriving at the Port of New York. After a short stay in New York City, Davison decided to go to Baltimore [for reasons history did not record].

When Davison arrived, America was a young and primarily an agricultural nation seriously affected by the growing pains of its industrial development. Producers abroad did not like the idea of the young nation developing industrially, and many American importers and legislators added much to the troubles of the men who were attempting to create new industries. At this time, too, the Nation was in the throes of a severe business recession, aftermath of the

of the men who were attempting to create new industries. At this time, too, the Nation was in the throes of a severe business recession, aftermath of the War of 1812. It suffered the economic turmoil of a country without stable money, without an adequate banking system, and without basic business discipline.

Agriculture itself was in process of change. The European farmers coming to America soon learned that the soil they tilled was not as rich as the soil of the British Isles and of the Continent. Many New Englanders already were heading West: to new and richer lands beyond the Appalachians.

The South was profoundly affected by Eli Whitney's invention of the cotton gin. This brought cotton out of the category of a luxury cloth and greatly increased the demand for it. In response, the farmers expanded their acres and intensified the cultivation, with a result that the soils were exhausted of their virgin plant foods.

To restore lost fertility, farmers resorted to use of natural fertilizers from whatever source it was possible to obtain them, in this respect following the experience of agriculture throughout time. One important such source, at that time, was **guano**, the deposit of gulls, cormorants, and penguins who find refuge in rookeries on ocean islands and along shores. It provides a combination of phosphates and nitrogen, a basic type of fertilizer.

American maritime history makes much of the Baltimore Clippers running a wet nose into the teeth of the storm, and whalers ploughing through the Tasman Sea, competing with the Clydeside boats out of Hobart for the sperm oil of Moby Dick. Carrying cotton to Shanghai or chasing whales in the Antarctic may be a bit more glamorous to read about than searching the Pacific for guano deposits on volcanic islands, but the sailors found an eager market among farmers of the Atlantic Coastal Plains for this natural deposit, and they rendered a generous service to those early growers of corn, cotton, and tobacco. There was mystery, too, in the lives of the guano sailors who cruised the coast of South America to islands like Chincha off Peru, or the strange Falcon Island, remote and fickle to the map makers. One crew actually reported that on a voyage to Falcon, they saw that volcanic peak settling slowly beneath the waves. This island played hide-and-seek with the sailors several times in the 19th Century, probably as a result of volcanic action on the deep floor of the Pacific; but, unfortunately, when Falcon Island subsided under the waves, it washed away a great commercial asset in its guano deposits.

With agriculture predominant in the economy and dependent upon natural fertilizer, and with industry finding the going so difiicult, there was little demand in those days for the products of chemistry.As late as 1831, the total capital invested in 30 chemical plants in the United States was $1,158,000. Philadelphia was the young Nation's most important chemical market. The chief products of the fledgling industry, in addition to sulfuric acid, were sal - ammoniac, alum, potash, copperas, Epsom salts, small amounts of white lead and other paint chemicals, and alcohol. The chemical industry then, as now, revolved around sulfuric acid, and was largely influenced by the price and availability of this indispensable chemical. Local supplies of brimstone or other sulfur compounds were unknown or inaccessible, and the producer of acid of that time had to depend upon brimstone imported from Sicily. It was almost a hundred years later that the sulfur domes of Louisiana and Texas were to make their remarkable contribution to the World's chemical industry.

This, then, was the not very encouraging picture that met the searching eyes of William T. Davison. We know him to have been a man of restless and inventive bent; he must have been one of vision also, because he not only chose the chemical industry for his lifework, but influenced it in directions which were to bring about its rapid expansion.

Davison organized the firm of **Davison and Kettlewell** in I832, and erected the first sulfuric acid chamber in the South. From [the] beginning, sulfuric acid has dominated Davison production throughout the years. An early advertisement describes the function of Davison and Kettle well as: "Grinders and Acidulators of Old Bones and Oyster Shells."

Ground bones were dumped into a pit in the ground, one man pouring in the sulfuric acid, while another stirred the mass with a large wooden paddle. The mass was permitted to set for several days, screened, and prepared for shipment.

The crude design of the early lead chamber sulfuric acid plant, and the method just described for producing phosphate bear little resemblance to our modern contact acid plants and superphosphate plants today. The important point for us is that Davison, displaying sound imagination of the able man of business, succeeded in linking together, for the benefit of each, the Country's tiny chemical industry with its primary pursuit of agriculture. **He got into fertilizer manufacture to provide a use for his sulfuric acid**, a union that has endured to this day. Davison, in developing his business, was chemist first and manufacturer afterward, and, in the early years of his business life, he continually was experimenting with acids, pharmaceuticals, and paints. Some years after starting the manufacture of superphosphate from old bones, he found a more economical raw material, in South Carolina **rock phosphate**, which, treated with the acid, provided an equally satisfactory superphosphate.

Competition then, as now, was a stimulus to enterprise, and, in 1836, another sulfuric acid plant was built in this Baltimore area by Dr. Philip S.Chappell. Alum and other chemicals were added products, but the company ran into financial difficulties and had an unfortunate career until it was destroyed by fire. Thereafter a new plant was erected by Chappell on the Patapsco River, at the mouth of Curtis Bay. This plant covered about five hundred acres and was the largest sulfuric acid plant in the United States at the time.

The coming of railroads was a genuine incentive to the Davison business, and Davison was an active supporter of and investor in the Iron Horse, which brought Baltimore, with its strategic location as a gateway to the Southeast, West, and North, into closer contact with the farming regions.

A period of expansion for Davison followed. In 1855, he dissolved his connection with Kettlewell, and the firm was reorganized as **Davison, Symington and Company**. About 1860, he formed a new company with one of his sons at its head, which was described as a manufacturer of chemicals, paints, varnishes, and allied products. In 1867, he was operating both **The Maryland White Lead Works** for paints, varnishes, and allied products, and t**he firm of William T. Davison**, located in the **Canton** section of the Baltimore waterfront, for the production and distribution of quinine, calomel, Epsom salts, and heavy chemicals, in addition to **Davison, Symington and Company**, for production of sulfuric acid.

The history of Davison would not be complete without a tribute to **Gustavus Ober**, who also contributed a great deal to the development of industry in Baltimore. Some twenty years after Davison's association with Kettlewell in the construction of a sulfuric acid chamber, Ober became associated with Kettlewell in the production of a fertilizer which they referred to as "Manipulated Guano." This was in 1852. They processed guano shipped from Peru and Mexico to provide a more complete plant food than the natural guano provided, and their formula was almost identical in the ratio of nitrogen and phosphoric acid with present day fertilizer requirements.

William T. Davison died on October I8, I881, leaving his sons to carry on his many business interests. Before and after his death there were several corporate successions which finally resulted in the formation by **Calvin T. Davison** and others, of the **Davison Chemical Company** . It operated two plants in the city, and likewise the Hawkins Point acid plant originally built by Chappell. **It was Calvin Davison who, in 1909, sought and obtained for his company capital to start construction of a new sulfuric acid plant at Curtis Bay**, [which as of 1851 was the home of the] company's Baltimore manufacturing and research operations. Thus again, sulfuric acid provided the stimulus for a noteworthy development in Davison history. Facilities for the production of normal superphosphate at this plant were to make it the largest single operation of its kind in the World

superphosphate at this plant were to make it the largest single operation of its kind in the World.

During the First World War the Davison Company increased its sulfuric acid production to meet the requirements of munitions. This left it with excess capacity following the War, and led to the expansion of the Company through the acquisition of ownership or control of about sixty fertilizer plants located throughout the eastern and southern parts of the United States. Fertilizer production and distribution was considered then as somewhat of a "feast-or-famine" business, one in which conservative investors were loathe to participate; but volume was thought of generally as a protection against the vicissitudes of the business cycle. This philosophy was proven to be fallacious when the dark days of the early 'thirties struck the Company. The effect of a drastic curtailment of consumption by farmers, plus decline in prices, was to make, of the many scattered fertilizer plants, a real financial burden. The Company was forced into receivership, in 1933 [, bringing Chester F Hockley] into the Davison picture as a receiver.

[World War I marked a dividing line for] the corporate history of the Davison Company. Technological developments following the First World War [led to tremendous changes in the chemical industry and gave] rise to many new industries based on chemical processes.

[...] Following the reorganization process of the receivership in which [the company] became **The Davison Chemical Corporation**, many of the fertilizer plants were disposed of. This was a drastic but necessary surgical operation on the corporate body. It reduced [Davison's] fertilizer capacity by about 50 percent, but most of the plants which were disposed of were obsolescent or poorly located for profitable operation. [Davison Chemical Corporation] retained a few modern plants strategically located in good agricultural regions.

At the same time, a program of diversification was decided upon and emphasis placed on Research and Development. Henceforth Davison emphasis was to be less on agricultural chemicals and more on industrial chemicals, with sulfuric acid basic in most of them.

The agricultural field was not neglected, however, particularly in view of the rising economic importance of the farmer; and, while disposing of unprofitable facilities, an opportunity came to bring into the Davison fold the plant of G. Ober & Sons, the enterprise whose founder was mentioned earlier. This firm had developed a process for granulating superphosphate which represented a totally new development in fertilizer technology, in which the product is made in the form of coarse granules rather than powdered, with advantages from both the agronomic and economic viewpoints. Thus it was that through the granulation process the Ober and Davison heritages and skill and enterprise in fertilizer and chemical manufacture were again united, after a lapse of. many decades. Later, the Ober granulation process was superseded by a Davison process developed by our own research staff and this is being steadily improved to increase efficiency of operation, obtain lower costs, and improve the products.

The reorganized company was in the position of being one of the larger manufacturers and marketers of superphosphate, and of having other products derivative from the process, but without a source of raw material. **Correction of this weakness was not practicable until 1946, when we purchased phosphate rock deposits at Bartow, Florida**, and complete mining and processing facilities. The Florida operation enables us to market raw rock phosphate as such, and it provides our complete control over a production sequence from mining, through processing of rock to fertilizer and many new products of industrial chemistry. '

This, in summary, was the course taken with [Davison Chemical Corporation's] heritage from earlier days in the field of fertilizers. The processes are based on sulfuric acid, and their efficiency is dependent upon an efficient source of the acid. Accordingly, step by step, [Davison Chemical Corporation has and continued to (as of 1951) enlarge and modernize it's] sulfuric acid facilities at Curtis Bay.

[...] Sulfuric Acid forges a link between agricultural and industrial chemistry in more ways than one. For instance, there is an important co ‑ product development in superphosphate production. When rock phosphate is caused to react with sulfuric acid, gases are liberated, among them fluorine in the form of silicon tetrafluoride. This is a very valuable substance which, by chemical means, is converted into a family of products known as silicofiuorides that are in great demand for a variety of purposes.

But to find the main stream of [Davison Chemical Corporation's] industrial chemical development it is necessary to go back to the days of the First World War and to the introduction of silica gel into the Davison picture. Here, also, excess sulfuric acid production was a factor in the development of this new product, just as it had been with William T. Davison's entry into fertilizer processing.

Silica Gel establishes a tie with one of our important Baltimore institutions, because the story of silica gel is a tribute to the primary research of The Johns Hopkins University.

Dr. Walter A. Patrick, a professor of physical chemistry at Johns Hopkins, [...] made one of the earliest contributions to the commercial production of silica gel. During the First World War he was working, at the request of the **United States Chemical Warfare Service**, on the selection of a material capable of adsorbing vapors and gases for use in gas mask canisters. In the progress of that work he developed the first process for producing silica gel. While silica gel is now well known throughout the World, yet knowledge of it in the early 'twenties was confined largely to scientists. Following its production by Dr. Patrick in the laboratory, its high moisture adsorbent qualities and its other characteristics were known only in a general way, and even after **The Silica Gel Corporation** had been formed, in 1921, for the production and sale of silica gel, the potentialities of the product had never been developed commercially.

In the course of the receivership of the Davison Company the inherent values of silica gel justified the purchase by the Davison Receivers, at auction, of The Silica Gel Corporation, then bankrupt, and which, upon Reorganization of The Davison Chemical Company, ceased to have a separate corporate entity. With the background of Dr. Patrick's work on silica gel, the reorganized Davison Chemical Corporation instituted an extensive research program which carried on where Dr. Patrick and the former Davison staf had left off. This has resulted in development of a completely new field of chemicals, gels of silica and various other materials. [As of 1951, from the original Patrick development, Davison Chemical is] are producing several hundred different types of products which fall in the category of gels and which have many and varied applications in industry.

[An intensive campaign where] every resource in the way of product research, and of merchandising and sales techniques, was put into convincing the buyers of desiccants that silica gel was the product they needed. The success was so outstanding that use of silica gel exceeds all others in this important field, and, as so often happens, acceptance in one use opened the door to acceptance in others and this, with the development of new products, created a new field of commercial enterprise.

The results of the program are indicated by the fact that, in I937, shipments of silica gel were still insignificant , a mere 78,000 pounds. But, by 1945, some 50,000,000 pounds were being produced largely for desiccant use. Much, but by no means all of this, was for wartime protection of ordnance.

Many continuing peacetime uses had been developed and a whole new field opened up through research into catalytic uses of silica gel and other gels. **Commercially significant development of gels in the catalyst field started in the Petroleum Industry when the demand for high octane gasoline increased rapidly in the early days of the Second World War as a result of the expansion of aircraft operation.** It was necessary for the Petroleum Industry to improve their methods of producing this material, and this resulted in the application of catalyst to the cracking of petroleum products. **We**

cooperated in the development of a gel catalyst for the fluid catalytic cracking process and, as a result of this development, in 1942, we built at Curtis Bay the first plant for the production of gel cracking catalysts. This plant has since been increased to triple its original capacity. Increasing demand for this type of catalyst resulted in our acquiring a plant in Cincinnati Which today is producing about the same quantity as the Baltimore facilities. 50 that now, silica gel from its small beginning of 78,000 pounds in I938 is being produced at an annual rate of almost one hundred million pounds per year.

Thus the sturdy youngster of the Davison Chemical family, offspring of its oldest member, sulfuric acid, has, through Davison research, come into its own as a new industry within the chemical group.

The appetite of industry and the Armed Services for benzene and other petroleum aromatics such as toluene and xylene is insatiable. Literally dozens of industries and thousands of products are dependent upon them, and must compete for them with the aviation and automotive industries. In response, new processes are coming into use which take over after the cracking process, and subject molecules to a “reforming” so as to produce a still higher yield of aromatics. Again, silica gel has proved to be the right catalytic base. Solution of the problems involved in production of catalysts which will serve most efficiently in the various petroleum processes offers challenges to our Research Staff.

The dramatic advantages which have accrued through use of catalysts in petroleum refining have influenced other developments. Catalysts have given the entire chemical industry one of its most potent keys to economic operation. The field is intensely interesting and a constant challenge to Research technicians and to venture capital. For Davison, our knowledge and experience gained with petroleum catalysts suggested a branching out into development and production of other types of catalysts. Accordingly, a specialty catalyst plant was built at Curtis Bay where catalysts are custom-made for a wide variety of applications, in many different physical forms, employing a broad range of catalytic substances and bases of several kinds as well as silica gel.

Petroleum refining is on a worldwide basis and silica gel catalysts produced by Davison or under Davison license are in wide use Abroad, a return of silica gel to Europe in a way that those who earlier carried it there could not have foreseen.

Much of this and other work of the Davison laboratories, among the many which are doing chemical and medical research, is on a long - term scientific program. Not all of its findings add up to dollars and cents on the black side of the ledger. However, the accumulated efiort always contributes to progress in chemical and medical science, and benefits people and industries everywhere.

As of 1951 ...

The functional hub of The Davison Chemical Corporation is still sulfuric acid, the product with which William T. Davison started in 1832. Our superphosphate activities at several points, our mixed fertilizer plants, our phosphate rock mining, the processing of rock and development of products such as the silicofluorides, silica gel and the catalysts, would not exist without the chemical vitality of sulfuric acid, which activates and changes so many useful items in our industrial and social existence.

This Newcomen Address, dealing with the pioneer work of William T. Dawson and with the history of The Daw'son Chemical Corporation, was delivered at the “195: Baltimore Dinner” of The Newcomen Society of England, held at EIkridge Country Club, Baltimore, Maryland, U.S.A., when M r. Hockley was the guest of honor, on October 2 4 , 195:

CHESTER F. HOCKLEY

MEMBER OF T H E NEWCOMEN SOCIETY C H A I R M A N O F T H E BOARD A N D PRESIDENT T H E DAVISON C H E M I C A L CORPORATION

B A LT I M O R E

M A RY L A N D

My fellow members of Newcomen:

CHESTER F. HOCKLEY was born in south central Pennsylvania, with a heritage from strict, sturdy people. He had a normal school and college education which ended at an early age. Immediately he started his career as a young Engineer in the Machine and Steel Industries, at the then customary very modest compensation which, under today’s conditions, seems almost insignificant. From then on, his career is What we like to term the typical American career of an ambitious young man.

He was endowed with great ability and with unusual imagination. He was restless for advancement, and obtained, in rapid succession, employment with Snow Steam Pump Works, Lackawanna Steel Company, Westinghouse Machine Company, and Bethlehem Steel Company.

He first came to Baltimore, in I919, with American Hammered Piston Ring Company which had been acquired by Bartlett Hayward Company. A year later, he became President of the Piston Ring Company. From this he moved to the Vice ‑ Presidency, and finally, in 193 I, to the Presidency of Bartlett Hayward Company.

His constant desire to grapple with new and difficult problems allied him, in one way or another, with the development of gas engines for the Steel Industry, the construction of new mills at the Bethlehem Steel Company for making the revolutionary H ‑ beam, in designing and producing improved piston rings, the introduction into the United States of America of the waterless gas holder, which first had been developed on a small scale in Germany, in the development on a large scale of granular superphosphates and fertilizers, and later, in the development of catalysts for use in oil refining and in other processes.

In 1933, Mr. Hockley was appointed Receiver for the old Davison Chemical Company and its affiliates. By many this was thought to be a liquidating proposition, but he struggled with it for two years until finally a new company emerged, with him as President and as its guiding spirit. To him is due not only the credit of converting the liquidation into a living entity, but for nursing that entity from a Weakling into finally becoming a strong, prosperous company which, in many ways, is an embodiment of himself.

...

The Davison Chemical Company : (see)

2019-marinelink-history-davison-chemical-company.pdf / https://drive.google.com/open?id=1EmzCeuYbb6bWVDdHTIaKLXipcBGcRfoE

THE importance of American control of the manufacture of chemicals for its own needs has been most emphatically demonstrated by the record of events in recent years.

The old-established chemical firm, the Davison Chemical Company, which has its principal office in the Garrett Building, at Baltimore, Maryland, is one of the most notable. It was founded in 1832 by William Davison and has been controlled by the Davison family ever since.

Following the death of Mr. Calvin Davison, his son-in-law, C. Wilbur Miller, who was then engaged in the practice of law, became actively identified with the company, and has since 1910 been its president. During the fifteen years he has been connected with the company its investment has increased from

$600,000 to more than $16,000,000, and it is now one of the largest chemical manufacturing plants in the world, producing **sulphuric acid, acid phosphate, sodium and magnesium silico fluoride, iron cinder and copper**.

Through its subsidiary organization, the Davison Sulphur and Phosphate Company, it owns important raw materials property, including a phos-phate rock mine in Florida and a pyrites mine in Santa Clara Province, Cuba. The Cuban ore contains a high percentage of copper, which will be extracted at the copper plant of the company.

The products of the company have been greatly augmented during the war period, and the plant worked up to its capacity to meet the urgent needs of manufacturers who use its products in their processes. The future of the fertilizer industry in the United States, which consumes large tonnage of acid phosphate, is unlimited, and the largest producing center for fertilizer in the world is Baltimore.

The broad policy of expansion, which was adopted by the Davison Chemical Company and which resulted in a vast amount of construction and new development work in the last ten years, is now beginning to show collective results. In the new conditions that are developing as a result of the world war, with an unquestioned expansion in all of the departments of production industries, the manufacture of chemicals and fertilizer material is necessarily one of the branches of production in which the United States is expected not only to supply its own needs but also to take care of the greatly expanded export trade. No concern is better prepared for this program of expansion than the Davison Chemical Company.

In the management of the business Mr. Miller is assisted by an able and efficient official staff, the membership of which includes George W. Davison, vice-president; W. D. Huntington, vice-president in charge of sales; E. B. Miller, vice-president in charge of operations; J. R. Wilson, secretary and assistant treasurer; T. J. Dee, treasurer. The Executive Committee of the company is composed of J. J. Nelligan, A. H. S. Post, Waldo Newcomer, C. Wilbur Miller.

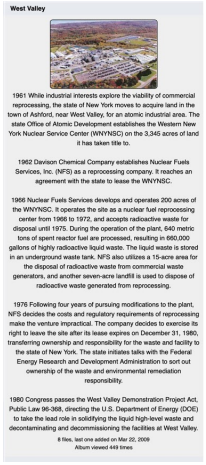
W. R. Grace and Company (FUSRAP Site) in Curtis Bay, Maryland

The W.R. Grace and Company is located on an industrialized peninsula in south Baltimore, Maryland. In the 1950s the W.R. Grace and Company milled thorium for the Atomic Energy Commission (AEC), a predecessor agency for the US Department of Energy. W.R. Grace began processing radioactive materials at the site in the 1950s, when Rare Earths, Inc. (W.R. Grace's predecessor) entered into a contract with AEC to extract thorium and rare earths from naturally-occurring monazite sands. Rare Earths' contract with AEC and its license to possess, transfer and use radioactive thorium were transferred to W.R. Grace and Company. Building 23, where the thorium processing took place, was open until the late 1950s when the contract was terminated. The wastes were buried in a landfill area. Thorium processing resulted in low-level waste that was buried on the property. Radiation surveys have shown that radioactive contamination still persists in the waste burial area, the waste management area which surrounds the waste burial plot, surfaces surrounding vats and hoppers in Building 23 and alpha-radiation surface contamination in the whole of Building 23. The site was designated by DOE for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1984. This site was one of the 21 Formerly Utilized Sites Remedial Action Program (FUSRAP) sites where cleanup responsibility was transferred to the US Army Corps of Engineers in 1997 in accordance with the Energy and Water Development Appropriations Act for FY 1998. Cleanup responsibilities transferred at that time from DOE-EM to the USACE.



2019-04-nukeworker-com-nuclear-facilities-na-usa-region1-northeast-nuclear-pictures-clip2.jpg / https://drive.google.com/open?id=1togqEtyH79xhPUZ4BLps4L9D7UpYWPx5

1961 While industrial interests explore the viability of commercial reprocessing, the state of New York moves to acquire land in the town of Ashford, near West Valley, for an atomic industrial area. The state Office of Atomic Development establishes the Western New York Nuclear Service Center (WNYNSC) on the 3,345 acres of land it has taken title to.

1962 Davison Chemical Company establishes Nuclear Fuels Services, Inc. (NFS) as a reprocessing company. It reaches an agreement with the state to lease the WNYNSC.

1966 Nuclear Fuels Services develops and operates 200 acres of the WNYNSC. It operates the site as a nuclear fuel reprocessing center from 1966 to 1972, and accepts radioactive waste for disposal until 1975. During the operation of the plant, 640 metric tons of spent reactor fuel are processed, resulting in 660,000 gallons of highly radioactive liquid waste. The liquid waste is stored in an underground waste tank. NFS also utilizes a 15-acre area for the disposal of radioactive waste from commercial waste generators, and another seven-acre landfill is used to dispose of radioactive waste generated from reprocessing.

1976 Following four years of pursuing modifications to the plant, NFS decides the costs and regulatory requirements of reprocessing make the venture impractical. The company decides to exercise its right to leave the site after its lease expires on December 31, 1980, transferring ownership and responsibility for the waste and facility to the state of New York. The state initiates talks with the Federal Energy Research and Development Administration to sort out ownership of the waste and environmental remediation responsibility.

1980 Congress passes the West Valley Demonstration Project Act, Public Law 96-368, directing the U.S. Department of Energy (DOE) to take the lead role in solidifying the liquid high-level waste and decontaminating and decommissioning the facilities at West Valley.

2007-04-07-tn-times-news-nuclear-fuel-services-celebrates-50th-birthday.pdf / https://drive.google.com/open?id=1tsW8c4gjhyJcgf38aWC5aJ30hh7pUNjc

ERWIN - Much of the activity in its production plant is shrouded in secrecy, but Unicoi County's largest employer doesn't want one piece of news to be classified: It has turned 50 this year.

Nuclear Fuel Services, which manufactures fuel for the Navy and converts highly enriched uranium into fuel used at the Tennessee Valley Authority's Browns Ferry nuclear power plant, has hit the half-century mark.

The industry plans to celebrate the anniversary in July, but it briefly commemorated the event at the Unicoi County Chamber of Commerce dinner last month.

NFS was born in 1957 in Baltimore when T.C. Runion, Charlie Taylor, Stan Reese and Ed Johnson hooked up with companies W.R. Grace and Davison Chemical, fueled in part by a desire by Congress to have commercial nuclear power plants.

W.R. Grace bought Davison in 1954, NFS spokesman Tony Treadway said.

"We've made a real contribution to society and the business world," said Taylor, who remained active in company affairs until he resigned from the board of directors in February.

According to a company brochure, the four men were working for National Lead Co. in Fernald, Ohio, when their lives intersected.

"We knew that W.R. Grace was wanting to grow into the nuclear business and that Davison Chemical made a lot of specialty chemicals, so we went to them for financial backing," Johnson said.

The choice of building NFS in Erwin was a matter of logic and personal feelings. Runion said the town was close to Oak Ridge and Savannah River, a Department of Energy site close to Aiken, S.C., and a railroad siding could be obtained for the Erwin property. Plus, Erwin was his hometown.

Taylor said the early years consisted of processing highly enriched uranium, low-enriched uranium and thorium metal. During down times, NFS made specialty chemicals. Later, NFS manufactured material for Consolidated Edison's first commercial nuclear reactor.

The company's most well-known role with the military evolved from the Navy's wishes to have a fleet of nuclear powered ships. NFS has been the sole provider of Navy fuel since 1966, and the first batch arrived at an aircraft carrier in 1969.

"We wanted to penetrate the Navy business, so NFS and W.R. Grace went to work on a better type of fuel completely on our own and without government support," Johnson said. "It was a really gutsy thing to do."

Runion recalled that he worked at the Erwin plant for 10 years, all of which he believed were profitable. He said that is unusual in the nuclear industry

Runion recalled that he worked at the Erwin plant for 10 years, all of which he believed were profitable. He said that is unusual in the nuclear industry.

"Most of all the companies took a beating the first two or three years," said Runion, who noted that everyone involved in establishing NFS believed that nuclear business "was going to be the way to go."

He said NFS was one of the first plants to produce uranium oxide as part of the fuel that nuclear power electric generating plants needed. The material used in Erwin was manufactured at a government plant in Oak Ridge, Runion said.

At the moment, NFS has about 540 employees, with more than 340 on salary and the rest being hourly, union employees.

Other union members are gradually returning to work after last year's strike ended. Employment was at its highest about 1,200 in the late 1980s and early 1990s.

Despite a connection to the U.S. government that keeps many aspects of its operation top secret, NFS has found itself regularly in the news over the years.

Sometimes, it's been the result of labor unrest. Occasionally, the union has gone on strike, the last one coming in 2006 and lasting five months. In 1985 and 1986, a strike lasted nearly a year. Taylor said NFS has probably had more problems with its union than other companies have encountered.

Roger Birchfield, who worked for NFS for 40 years before retiring in 2006 and was union president during the recent strike, said he believes unions are good for a company and employees because it provides a structure by which both can work. He said it is important, especially in a nuclear plant, to have an organization to follow up on safety issues.

Periodically, NFS has found itself in trouble with the Nuclear Regulatory Commission. The federal agency fined NFS $10,000 in 1985 for what was called a "dangerous buildup of uranium" in the plant's air vents.

The NRC shut down the plant in 1979 when NFS could not account for 19.8 pounds of uranium. After the company was able to document most of the uranium, the NRC allowed the plant to reopen.

In 1996, an NFS incinerator caught fire, but it caused no injuries or radiation contamination, company officials said.

One of the toughest periods for the company began in 1992 when the Navy canceled its contract with NFS because its fuel needs dropped as the Cold War ended. Taylor recalled that as one of the dark periods for the company as employment plummeted by more than half from 800. NFS regained the contract in 1996.

When NFS lost its contract with the Navy, the company did not think it was on its last legs because it knew that branch of the military would need fuel again, Treadway said. But he said the company realized it "needed to be more aggressive in new business development."

1978-11-us-doe-western-ny-nuclear-service-center-report-vol1 / https://drive.google.com/open?id=1u2oFRSwcQvei0LPCue9gYzw3A_z0O61Q

1.1 HISTORY

A stated purpose of the Atomic Energy Act of 1954 was to promote "wide spread participation in the development and utilization of atomic energy for peaceful purposes." The Atomic Energy Commission (AEC) actively encouraged private industry to enter the field of nuclear power. By the end of 1955, the AEC concluded agreements for the first few demonstration power reactors.

In 1954, the AEC began a program to encourage private participation in the reprocessing of irradiated nuclear fuel as part of its program to commercialize the entire nuclear fuel cycle. To have commercial reprocessing services available for the first irradiated fuel in 1961, the AEC offered to make available the reprocessing technology developed for the defense program.

In 1959, New York State's interest in attracting atomic development culminated in the formation of the Office of Atomic Development (OAD) as an independent agency responsible for coordination of atomic regulatory and development functions within the State. To encourage nuclear development, the OAD acquired the West Valley site in 1961, which became designated the Western New York Nuclear Service Center (WNYNSC). The purpose of the Center was to store nuclear fuels and radioactive wastes and to be available for related industrial development.

The **Davison Chemical Co.** was sufficiently encouraged by the developments in the late 1950's to consider the feasibility of constructing a reprocessing facility. In 1961, Davison expressed interest in operating the WNYNSC. January 1962, Davison outlined its plans to the AEC for constructing a In private reprocessing plant. To pursue the reprocessing venture, Davison set up Nuclear Fuel Services, Inc. (NFS), whose stock was owned by the W. R. Grace Co. (78%) and American Machine and Foundry (22%). NFS, in its proposal, indicated its willingness to provide and maintain storage for a limited period of time for the high-level liquid wastes (HLLW)t resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the was tes. The proposed, and eventually approved, method of waste disposition was to store them in liquid form in underground storage tanks, similar to the method being used at AEC production facilities.

1979-us-doe-western-ny-nuclear-service-center-companiion-report-vol2.pdf / https://drive.google.com/open?id=1u94lpBjuojDHVlTaqgNtJwm_avkOvsyy

1. 1

HISTORY OF WEST WALLEY

A stated purpose of the Atomic Energy Act of 1954 was to promote "wide-spread participation in the development and utilization of atomic energy for peaceful purposes." The Atomic Energy Commission (AEC) actively encouraged private industry to enter the field of nuclear power. By the end of 1955, the AEC concluded agreements for the first few demonstration nuclear power reactors.

In 1954, the AEC began a program to encourage private reprocessing of irradiated nuclear fuel as part of its program to commercialize the entire nuclear fuel cycle. By January 1956 this program resulted in an announcement by the AEC that:

- The AEC would make available to industry AEC technology on reprocessing and the description of fuels available for reprocessing
- The AEC invited proposals by industry to design, reprocessing plants construct, and operate
- The AEC would provide assistance in the form of a baseload and allow the use of AEC facilities for development work and training.

During discussions of this program with industry, three predominant issues were raised. The first was the lack of adequate demand to make a commercial reprocessing plant economically viable. The AEC offered to provide a baseload of fuel from its production reactors to support the plant until adequate demand developed.

The second predominant issue was the lack of a basis for establishing reason able charges for services. In 1957, the AEC announced a policy to assure that reprocessing services would be available for the first commercial irradiated fuel in 1961. Under this policy, the AEC would provide fuel reprocessing services in AEC facilities until services were available commercially at reasonable prices or until June 30, 1976. To establish charges for those services, the AEC designed a hypothetical reprocessing plant. The reasonableness of commercial charges was to be based on comparison with these hypothetical plant charges.

The third predominant issue was responsibility for the high-level radioactive wastes resulting from commercial reprocessing. The AEC policy was to encourage the maximum participation of industry in the management of these wastes. It was recognized that industrial longevity was insufficient to assume ultimate responsibility for these wastes. For West Valley, this factor was overcome by having ownership of the land reside with the State.

Perceiving an opportunity to promote industrial development within the State, New York, in 1956, had created a State Council on the Development of Atomic Energy, followed by the formation of the Office of Atomic Development (OAD) in 1959. In 1961, OAD acquired a 1350-hectare (ha) (3345-acre) site near the hamlet of West Valley in the Town of Ashford, Cattaraugus County, about 48 km (30 miles) south of Buffalo. The site was judged to be favorable for a nuclear fuel reprocessing plant and attendant waste facilities. It was favorably located with respect to projected nuclear reactor development in the north eastern and mid-Atlantic United States. In addition, the silty till in the West Valley area was relatively impermeable to water and would, therefore, provide protection against migration of waterborne radioactivity through the ground. Further advantages of the site were a low population density in the area and meteorological conditions favorable for atmospheric dilution of any radioactivity released. The site was named the Western New York Nuclear Service Center (WNYNSC); it is also referred to as West Valley or the Center.

The developments of the late 1950s were sufficiently encouraging for utility and industrial concerns to form the Industrial Reprocessing Group (IRG). The IRG, composed of Davison Chemical, Consolidated Edison, Commonwealth Electric, and Northern States Power, in 1ate 1959 initiated a technical and economic feasibility study of reprocessing. As a result of IRG's interest, the AEC delayed indefinitely the modification of facilities planned for processing commercial fuel, but would continue to receive fuels for which reprocessing capability did not exist or charges were not reasonable.

In 1961, the Davison Chemical Company expressed interest in the West Valley site. In January 1962, Davison outlined its plans to the AEC for constructing a private reprocessing plant. To pursue the reprocessing venture, Davison (which was acquired by W. R. Grace and Company) set up Nuclear Fuel Services, Inc. (NFS). W. R. Grace owned 78% of the NFS stock and American Machine and Foundry owned the rest.

NFS indicated its willingness to provide and maintain storage for a limited period of time for the high-level 11quid wastes resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount of money calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the wastes. The proposed, and eventu ally approved, method of waste disposition was to store the wastes in liquid form in underground storage tanks, similar to the method being used at AEC production facilities

HUTZLER BROTHERS CO

90 years of leadership

see our Howard Street window honoring The Davison Chemical Corporation

A Maryland Institution Salutes Maryland's Past and Future...

The Davison Chemical Corporation

From modest beginnings over a hundred years ago, The Davison Chemical Corporation has grown along with Baltimore. A program of expansion, that began in 1908, has resulted in today's tremendous Curtis Bay Works, where just one unit, devoted to the production of superphosphate, is reputed to be the largest of its kind in the world.

In addition to agricultural chemicals, Davison also produces many industrial chemicals that are used for specialized applications. One group, Davison Silicofluorides, is used in such industries as aluminum metallurgy, ceramics and glass making, insecticides, mothproofing, laundry sours, antiseptics, concrete hardeners, wood preservation, explosives and many others.

Silica gel is another widely-used Davison product. As a dehydrating, or drying, agent, it is used to remove moisture or water from liquids, air and other gases . . . in the refrigeration, telephone, petroleum processing, dehydrated packaging and other fields. Tons of this material are being used to protect our huge Naval Reserve Fleet against rust and corrosion caused by moisture.

Evidence of practical use of Davison Catalysts can be seen in the skies over Canton at night . . . the flames belching from the huge stack at Esso Standard Oil result from the catalytic cracking of petroleum to make high quality gasoline. Davison also produces a family of asphalt compounds which includes Fendix, an automobile underbody protective coating and sound deadener. Other compounds are used as protective coatings on paperboard cartons to guard against moisture penetration.

The products mentioned above are but a fraction of the total. Ships, railroads and truck lines carry the names "Davison" and "Baltimore" to the four corners of the earth.

Mr. Chester F. Hockley, President of The Davison Chemical Corporation, says: "As a result of diversification of products, modernization of plant facilities — investments in new facilities and an extensive research program for development of improved processes and new products, Davison's volume of business is expected to increase materially in the future and provide greater opportunities for employment for Baltimore citizens."

HONOLULU STAR-BULLETIN, WEDNESDAY, AUGUST 20, 1958

Tourist Study For Pacific Starts Soon

The Pacific area's $250,000 tourism development project will be launched September 1 with a preliminary study and investigation in Washington, D.C., it was announced yesterday in San Francisco.

The project will give technical assistance to help promote tourism in Australia, Burma, Cambodia, Fiji, Hong Kong, Indonesia, Japan, Korea, Laos, New Zealand, the Philippines, Singapore, Tahiti, Thailand, Taiwan and Vietnam.

These countries will contribute $100,000 to go along with a $150,000 contract between the U.S. Department of Commerce and Checchi and Company, consulting economists in Washington.

GUIDE PROJECT

The Pacific Area Travel Association will guide the project.

The operation will swing into its second phase, and first field trip, in January.

The trip will tie in with P.A.T.A.'s annual conference in Singapore January 26-30.

Two more field trips are planned—one next year and one in 1960—to determine needs of the countries.

Recommendations are expected to be made for programs in the individual countries after July, 1960.

DEVELOPED IDEA

The idea for the project was fostered by P.A.T.A. at its annual conference in Tokyo in 1956.

Honolulu's William J. Mullahey was named chairman of the Research and Survey Committee to study tourist-earning potentials in Pacific countries.

Mullahey is director of Pan American Airways' Central and South Pacific operations.

A SHAKEUP AT I. D. S.

Tuohy Quits Board Over Conflict of Interests.

New York, July 15.(AP)—Walter J. Tuohy, president of the Chesapeake & Ohio Railway, resigned today as director of Investors Diversified Services, Inc., in a top level shakeup of officials of the Minneapolis-based investment company.

Tuohy said he was resigning because he believed his obligations to the C. & O. might conflict with his obligations as a director of I. D. S., which is controlled by the Alleghany corporation. Alleghany also controls the New York Central Railroad, which is challenging an attempt by C. & O. to obtain control of Baltimore & Ohio Railroad through an exchange of stocks.

W. Grady Clark was elected president of I. D. S. in place of Joseph W. Fitzsimmons, who was named chairman of the investment committee. Directors said Fitzsimmons's health prevents him continuing to serve as chief executive officer.

Clark, who formerly served as senior vice-president, has been with I. D. S. 27 years.

Clifford H. Ramsdell, former official of the Thomas J. Deegan company, was elected vice-president-staff of I. D. S., a new post. The Deegan firm on Monday resigned as public relations counsel to Alleghany corporation and the New York Central "because of a conflict of interest."

In other developments, Jared C. Horton, secretary and treasurer of Alleghany, was elected to the I. D. S. board to replace Tuohy and William E. Eppler resigned as a director of the Central, Alleghany corporation and I. D. S.

THE EVENING SUN, BALTIMORE, MONDAY, MARCH 11, 1963

Inspection Of Academy Is Starting Today

The Board of Visitors will make their annual visit to the United States Naval Academy from today through Friday.

The purpose of the board is to report to the President on such matters as morale, discipline, curriculum, physical equipment, fiscal affairs and other matters relating to the Academy.

Members of the board who were appointed by the President are: Thomas J. Deegan, Jr., chairman, Thomas J. Deegan Company, New York city; David J. McDonald, president, United Steel Workers of America, Pittsburgh; Dr. Edgar F. Shannon, Jr., president, University of Virginia, Charlottesville, Va.; Stanley M. Stalford, chairman of the board, Fidelity Bank, Beverly Hills, Cal.; Guy Stillman, consulting engineer, Phoenix, Ariz., and William H. Vanderbilt, former governor of Rhode Island and Naval Reserve captain, Chestnut Hill, Mass.

Three senators remain to be appointed by the Vice President.

Members appointed by the Speaker of the House are: Representative Flood (Pa.), Representative Kee (W.Va.), Representative Minshall (Ohio) and Representative Stinson (Wash.).

Ex-officio members are: Senator Case (N.J.) and Representative Pike (N.Y.).

The chairman of the board will be chosen by the board members on the first day of the visit. Cmdr. Richard T. Lyons, U.S.N., executive officer of the Academy's Weapons Department, has been designated secretary to the Board of Visitors. Lt. Cmdr. Paul D. Lawler, USN, science department, and Dr. William S. Shields, assistant to the superintendent for academic matters, are the assistant secretaries.

Two Committees

During their first meeting the board will be divided into two committees. Committee 1 will report on curriculum, academic procedures, faculty and admissions. Committee 2 will report on morale, discipline, fiscal affairs and the physical plant.

During the five-day visit these two committees will conduct inspections and attend informal meetings and discussions.

1964 NYC worlds fair - more economics, less art

(Nov. 17, 1977) - Thomas J. Deegan Jr., Organizer Of ‘64 - 65 World's Fair, Dies at 67

By Alfred E. Clark

Source : [HN00ZD][GDrive]

Thomas J. Deegan Jr., who helped orramze the New York World's Fair of 1964 - 65 and was chairman of its executive committee, died yesterday of a heart attack at his residence at the Hyde Park Hotel, 25 East 77th Street. He was 67 years old.

Mr. Deegan, a one - time newspaperman and public relations consultant, was chairman of the executive committee of Sydney Baron R Company, an interna t innal public relations company.

Former. Mayor Robert F. Wagner named •mr. Deegan chairman of the New York World's Fair Corporation in 1959 and he Served in that capacity until the corporation was dissolved in 1971.

" Mr. Deegan invited Robert Moses to become the paid president for the World's, Fair and after its opening on April 23. 1964, it ran for two six - month seasons and attracted 51 million paid admissions. The Deegan concern undertook the advance sale for the fair and sold 28 million' tickets for a gross revenue of $35 million before the fair opened.

Lined Up Exhibitors

With the help of the newly elected President, the late John. F. Kennedy, Mr Deegan and Mr. Moses received Administration support for a bill in Congress that authorized $35 million for the United States Pavilion.

In the preparatory period he worked tirelessly to line up 'exhibitors. He received a promise of a pavilion from then Premier Nikita S. Khrushchev of the Sriviet Union—later withdrawn—and peritiaded Pope John XXIII to accept the idea of the Vatican Pavilion.

With the assistance of the late Francis Cardinal Spellman, Mr. Deegan was instrumental in having Michelangelo's Pieta sent by the Vatican to the fair, the first time the statute had been removed from there in 454 years. Fourteen million people, second only in attendance to the General Motors Exhibit, went though the Vatican Pavilion to view the Pieta.

Born in Boroklyn on July 11, 1910, and a product of the 1929 Depression, Mr. Deegan was in the Class of '34 at Fordham University. As an undergraduate, he worked as a writer on space rates and as rewrite man for The New York Times.

Because of economic conditions he had to leave college after, his sophomore year to work full time. In 1964 he was awarded an honorary Doctor of Laws degree by Fordham and on the basis of his achievements, and academic papers he submitted he was awarded his Bachelor 7cf Arts degree in 1965, 31 Years after his class had received its undergraduate degrees.

Later the Dcegtoi company became part ... of the Interpublic Group of Companies Inc. Over the years, his friends have included pre - idents and corporate leaders, baseball players and clergyMen.

When Lyndon B. Johnson sought the Democratic nomination for President in 1960, Mr. Deegan was one of his principal advisors. As the running mate to Mr. Kennedy, Mr. Johnson and his wife, Lady Bird, had visited the Deegan family at their home in Greenwich, Conn., during the campaign.

Mr. Deegan was decorated a Knight Grand Cross of the Holy Sepulchre by Pope Pius XII and a knight of Malta by Pope John XXIII.

Made Recommendations to Pope

In 1967 he led an international delegation of 36 business leaders of all faiths who made recommendations to Pope Paul VI on ways to implement the Pope's en''On the Development of Peoples."

In 1965 he Was named Catholic Layman of the Year. He had been a personal adviser to the Vatican on matters of world opinion for more than 20 years.

At 17 he began his newspaper career as a high school correspondent with The Brooklyn Eagle. He later shifted to The Times and in 1938 left to become assistant to the president of the Fifth Avenue Association.

He had eight children and is survived by seven of them. They are Thomas Deegan 3d of New Haven, Christopher of Washington, Timothy John of Beverly Hills, Calif. Michael Nicholas of Laramie., Wyo., Mrs. Colman McCarthy of Washington, Mary Angela of London and, Cecily Ann of Cambridge, Mass.

Other survivors include two sisters, Mrs. Edward C. Chickering and Mrs. Christopher Murphy of Chevy Chase, Md.. and his former wife, Alice Russell Deegan of Greenwich. Conn.. and four grand nits.

A Mass of the Resurrection will he celebrated at St. Ignatius Loyola Roman Catholic Church, Park Avenue and 84th Street, on Saturday at 11 A.M.

Dr. David Bliss Dekker (born 1919)

[HN01BE][GDrive]

Born - May 28, 1919 (https://www.findmypast.com/transcript?id=USBMD%2FSSDI%2F573054343)

Died - Sep 3, 2004 (https://www.findmypast.com/transcript?id=USBMD%2FSSDI%2F573054343)

Married **Evelyn Eirene Ponsonby in 1942 (became Evelyn Eirene Dekker)**

See below for notes

Notes:

- Sometimes name is misspelled (such ass In the puget sound paper ..) as "David Decker"

Associated with :

- **Carl Garland Young (born 1926)** (Colleague at University of Washington Computer Center / Co-founder of **Computer Center Corporation (Seattle)**)
- Monique R Rona (born 1928) (Co-founder of **Computer Center Corporation (Seattle)**)
- Stephen Russell (born 1937) (colleague at **Computer Center Corporation (Seattle)**)
- Gary Arlen Kildall (born 1942) (David B Dekker was Gary Kildall's undergraduate professor at University of Washington)

1930 US Census

Father - Albert H Dekker

Full census form - [HS003Y][GDrive]

Household Members

First name(s)	Last name	Relationship	Marital status	Sex	Age	Birth year	Birth place
Albert H	Dekker	Head	Married	Male	40	1890	Illinois
Rose Marie	Dekker	Wife	Married	Female	39	1891	Illinois
Albert O	Dekker	Son	Single	Male	16	1914	Illinois
Mary E	Dekker	Daughter	Single	Female	15	1915	Illinois
David B	**Dekker**	**Son**	**Single**	**Male**	**10**	**1920**	**Illinois**
John H	Dekker	Son	Single	Male	2	1928	California
Mary E	Bliss	Grandmother	Widowed	Female	84	1846	Vermont

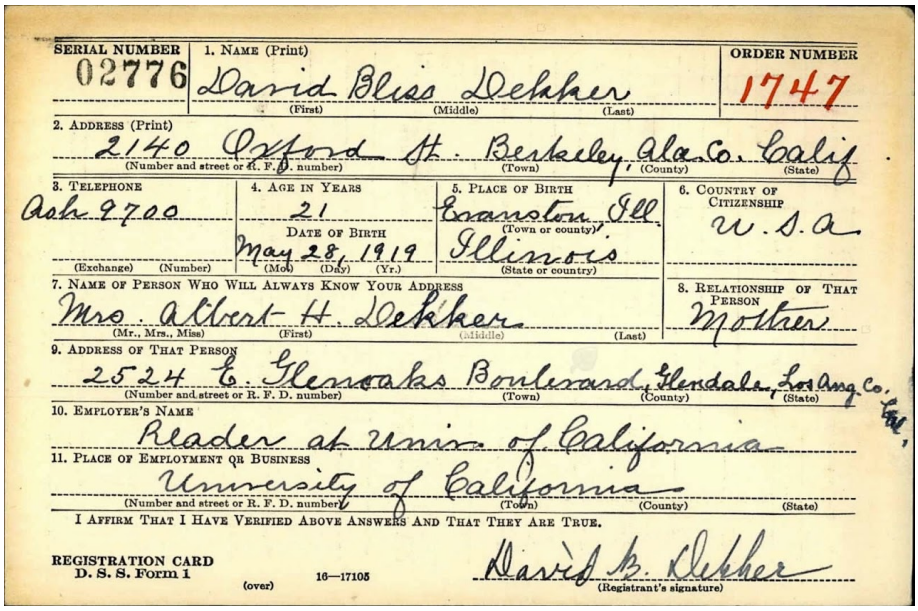
1941 - David Bliss Dekker - Honors Society

https://newspaperarchive.com/berkeley-daily-gazette-mar-05-1941-p-9/

WW2 service Registration : 1940



SERIAL NUMBER 02776 — ORDER NUMBER 1747

1. NAME (Print): David Bliss Dekker (First) (Middle) (Last)

2. ADDRESS (Print): 2140 Oxford St. Berkeley, Ala Co. Calif (Number and street or R. F. D. number) (Town) (County) (State)

3. TELEPHONE: Ash 9700 (Exchange) (Number)

4. AGE IN YEARS: 21 — DATE OF BIRTH: May 28, 1919 (Mo.) (Day) (Yr.)

5. PLACE OF BIRTH: Evanston, Ill. (Town or county) Illinois (State or country)

6. COUNTRY OF CITIZENSHIP: U.S.A.

7. NAME OF PERSON WHO WILL ALWAYS KNOW YOUR ADDRESS: Mrs. Albert H. Dekker (Mr., Mrs., Miss) (First) (Middle) (Last)

8. RELATIONSHIP OF THAT PERSON: Mother

9. ADDRESS OF THAT PERSON: 2524 E. Glenoaks Boulevard, Glendale, Los Ang. Co. Calif. (Number and street or R. F. D. number) (Town) (County) (State)

10. EMPLOYER'S NAME: Reader at Univ. of California

11. PLACE OF EMPLOYMENT OR BUSINESS: University of California (Number and street or R. F. D. number) (Town) (County) (State)

I AFFIRM THAT I HAVE VERIFIED ABOVE ANSWERS AND THAT THEY ARE TRUE.

David B. Dekker (Registrant's signature)

REGISTRATION CARD D. S. S. Form 1 (over) 16—17105

REGISTRAR'S REPORT

DESCRIPTION OF REGISTRANT

RACE		HEIGHT (Approx.)		WEIGHT (Approx.)		COMPLEXION	
White	✓	5'-7½"		125		Sallow	
Negro		EYES		HAIR		Light	✓
Oriental		Blue	✓	Blonde	✓	Ruddy	
Indian		Gray		Red		Dark	
Filipino		Hazel		Brown		Freckled	
		Brown		Black		Light brown	
		Black		Gray		Dark brown	
				Bald		Black	

Other obvious physical characteristics that will aid in identification

I certify that my answers are true; that the person registered has read or has had read to him his own answers; that I have witnessed his signature or mark and that all of his answers of which I have knowledge are true, except as follows:

Ida M. Morse (Signature of registrar)

Registrar for 164 (Precinct) Berkeley (Ward) Ala. Co. Calif. (City or county) (State)

Date of registration Oct 16 — 1940

LOCAL BOARD NO. 69 2825 Milvia St. Berkeley, Calif.

69

(The stamp of the Local Board having jurisdiction of the registrant shall be placed in the above space.)

[1] Ernest Randall Bartley.....Political Science .....Lincoln, Nebraska
A.B. Nebraska Wesleyan University 1940; M.A. University of Nebraska 1941.
Thesis: The tidelands controversy: a study in American federalism.

[1] Walter Raymond Borg.....Education .....Roseville
A.B. San Diego State College 1943.
Thesis: Factors relating to success in art school and artistic ability.

[1] James McComb Bradfield, Jr.....Education .....Oakland
A.B. University of Kansas 1938; M.A. 1946.
Thesis: Youths' understanding of determinants of their behavior.

[2] Robert Barnes Casady.....Comparative Physiology .....Pasadena
B.S. 1941.
Thesis: Factors modifying the excretion of fecal androgens in the cow.

[2] David Bliss Dekker.....Mathematics .....Glendale
A.B. 1941; M.S. Illinois Institute of Technology 1943.
Thesis: Hypergeodesic curvature and torsion.

[1] Melbourne Evans .....Philosophy .....Berkeley
A.B. Reed College 1937; M.A. 1940.
Thesis: Principles and methods of physical thought: a study in the philosophy and science of ancient and early modern times.

[2] Herta Harriet Forster.....Physics .....Sacramento
M.A. 1947.
Thesis: A study of cosmic rays in nuclear emulsions at high altitudes.

[2] James John Fritz.....Chemistry .....Wilkes-Barre, Pennsylvania
B.S. Pennsylvania State College 1939; M.S. University of Chicago 1940.
Thesis: The thermodynamic and magnetic properties of cobalt sulfate heptahydrate in the temperature range from 0.2°K to 20°K.

[2] James Wessel Gerdemann.....Plant Pathology .....Warrenton, Missouri
A.B. 1945 and M.A. 1946 University of Missouri.
Thesis: The resistance of two tomato varieties to formae of *Fusarium oxysporum*.

[2] Richard Allen Goff.....Zoölogy .....Bucklin, Kansas
B.S. Kansas State Teachers College, Emporia, 1937; M.S. University of Oklahoma 1939.
Thesis: Development of the mesodermal constituents of feather germs of chick embryos.

[2] William Francis Goodwin.....Philosophy .....Richmond
A.B. 1938; M.A. 1941.
Thesis: Knowledge and existence in the philosophy of George Santayana.

[2] Lawrence Morton Grossman.....Mechanical Engineering ..New York, New York
B.Ch.Eng. College of the City of New York 1942; M.S. 1944.
Thesis: The statistical theory of turbulence and measurements of turbulent velocity components in axisymmetric liquid flow.

[1] John Gurland .....Statistics .....Ottawa, Ontario, Canada
A.B. 1939 and M.A. 1942 University of Toronto.
Thesis: I. Asymptotically normal estimates. II. Inversion formulae for the distribution of ratios.

[2] Kenneth Robert Hammond.....Psychology .....San Francisco
A.B. 1940; M.A. 1947.
Thesis: Social effects on psychiatric hospitalization.

[2] James William Hansen.....Agricultural Chemistry .....Riverside
A.B. University of California at Los Angeles 1936.
Thesis: The electrostatic charge on insecticidal dusts.

[2] Frank Harary .....Mathematics .....Brooklyn, New York
A.B. 1941 and M.A. 1945 Brooklyn College.
Thesis: The structure of Boolean-like rings.

[1] Joseph Lawson Hodges, Jr.....Mathematics .....Phoenix, Arizona
A.B. 1942.
Thesis: Studies in optimum statistical procedures: I. Initial sample size in the Stein procedure. II. Stringency in acceptance sampling.

[2] Jack Alroy Holmes.....Education .....Berkeley
A.B. 1938; M.A. 1942.
Thesis: Factors underlying major reading disabilities at the college level.

"Note : A single date following the name indicates the beginning of service in the University. When two dates are given, the second, in parentheses, is the date of promotion to present academic rank."

1956 (Sep 11) - Assistant Professor of Mathematics Dr. David Dekker opened the Pacific Northwest's first academic computing laboratory at the University of Washington (UW)

http://pcad.lib.washington.edu/building/10146/

Building History

[...] A writer for the *Seattle Times* described the high-tech machine: "The magnetic drum, operating on the principle of a magnetic tape recorder, can store or 'memorize' 20,000 digits. It is used to set up the problem. A problem that would take eight hours to do by hand on a desk calculator can be solved in five seconds with the new machine, university authorities said. A more difficult problem, which would require a week's work by hand, takes a little more time—about five minutes."

The UW Departments of Mathematics and Business Administration became the first on campus to access the Research Computing Center's **IBM Model 650**'s "electronic brain." The *Seattle Times* writer noted that the computer would be used for two new classes: "Mathematics students will take a course known as 'numerical analysis.' The business students' course will be called 'data processing.' **Dr. Carl B. Allendoerfer** *[See https://en.wikipedia.org/wiki/Carl_B._Allendoerfer]*, **head of the Mathematics Department and chairman of an intercollegiate committee on high-speed computers, said university departments previously had been sending work requiring electronic calculation to California and New York. The I.B.M. Co. rents the machine to the university, donating 60 per cent of the basic rental fee of about $60,000, a year. The National Science Foundation is contributing $17,500 a year. University research and rental charges to departments using the machine will make up the rest of the cost."** (See "U.W. Opens Regions's First Research Computing Center," *Seattle Times*, 09/11/1956, p. 11.) *... [Basically, IBM and the NSF provided for what was essentially a free computer]*

In an adjacent story in the same issue of the *Seattle Times*, the Boeing Airplane Company announced that it had begun operating a rented IBM Model 705 computer beginning on 09/10/1956. An official ceremony attended by William M. Allen, Boeing's President and Thomas J. Watson, IBM's President, launched the computer's first day of work calculating "...payroll, stores, records, accounts payable, labor and material distribution, material records and other assignments. Savings of more than $500,000 are expected through use of the machine. Rental is $36,500 a month."

In 2010, the University of Washington chose to rename the Academic Computing Center for John "Mike" Wallace, a renowned UW atmospheric sciences professor. A UW news web site noted two honors bestowed on Wallace in 2010, for his pioneering research on global climate change: "His impact on climate science, at the UW and globally, led to two recent noteworthy events on campus. In September, friends and colleagues from around the world gathered for a two-day Wallace Symposium that was billed as a celebration of his 70th birthday and his many contributions to science, students and the community. This summer, the former Academic Computing Center, which now houses the new College of the Environment, the Program on the Environment and a UW-based institute he headed for many years, was renamed John M. Wallace Hall." (See Vince Stricherz, *UW News*.edu, "Illustrious career brings singular honors for Mike Wallace," published 10/07/2010, accessed 09/03/2020.)

The UW Program on the Environment continued to occupy Wallace Hall in 2020.

1957 - 1959 - University of Washington

Biography
Of

By Eugene E Collias
Volume Three—Oceanography

[HI001J][GDrive]

IBM 650 Computer and other UW computers

When I returned to the UW in January 1959, the hot topic was the **IBM 650 computer**. Many of us would have to learn how to program and operate this latest addition to the University. **Dr. David Decker (1923?-2004) was the director of the Computer Laboratory and taught a class in programming. The Computer Lab was located on the fourth floor of Bagley Hall over the main entrance.**

Because oceanographic data processing requires many repetitious mathematical operations, it was deemed necessary that many of us in oceanography learn how to use this device. When I was informed that I would be taking a class in computer programming, I jumped at the chance. The classes started one week before I was officially on the payroll.

The first time I addressed this monster was on, Thursday 8 January 1959. I was petrified as I stood in front of the control panel with its many dials and flashing lights. In about two weeks, we became very well acquainted and the fear level dropped. But the frustration level remained high and still does today with our "very advanced" computers.

The IBM 650 magnetic drum data processing machine consisted of two bays each being three feet wide, six feet tall and eight feet long. Attached to the computer was an IBM card reader/punch. The internal memory consisted of a drum, about the size of an oatmeal box, coated with ferric oxide and was turning at 1,800 RPM. It held a total of 2,000, ten character words in a bi-quinary format. In today's concept of storage this would be the equivalent of 20 thousand bytes. The computer I am using to write this biography has 4 billion bytes of internal memory and this is considered to be small. Computers have come a long ways in 50+ years.

There were 3,750 vacuum tubes, mostly 12SN7's, that did all the work. Operation speeds were measured in milliseconds. It could take as much time as 50 milliseconds to multiply two ten-digit numbers. A patch panel inserted into the end of the card reader/punch determined where the data would be placed into or retrieved from memory.

When the 650 would act up, Chet Castle would be called in for the repair. He was the IBM engineer assigned to this 650. One time it took him over three weeks to determine what was wrong with the computer. When he opened a door to a bay, the computer would act correctly. He eventually located a chip out of a capacitor. Dust would accumulate on the exposed wire causing a temporary short. When the bay door was opened the dust would be cleared and normalcy would return. He gave me the module. I kept it on my desk for many years.

A keypunch (IBM model 24 or 26) was used to prepare the data and program on Hollerith (IBM) cards. Each Hollerith (IBM) card had 80 columns and 12 rows where information could be punched in a total of 960 locations. The information on the cards could be in either alphanumeric (A-Z upper case only or 0-9) or binary format. Data sets used alphameric characters while programs were usually in binary format. **During my tenure at the UW, I used over one million IBM cards.**

In addition, to the IMB 650, the computer lab housed the necessary peripheral devices necessary to feed data and programs into the compute. These devices included: key punches, a tabulating machine, card sorters, interpreters, and a collator. The IBM 650 computer, with its necessary peripheral equipment, required over 30,000 watts of electrical power. We had 4.5 tons of air conditioning to keep the room cool.

The IBM 650 laboratory was a do-it-yourself type with some assistance from the "experts" when needed. When you wanted to use the IBM 650, you signed up for a time slot usually in 30 minute increments. A large blackboard was used to write your name in the appropriate time slot. Frequently there were no Anglo- Saxon names on the board.

If you were going to use the machine after regular hours, there was a last-man- out routine for shutting down the entire system; computer, air conditioning, and any other peripheral equipment. Thus, it was always desirable to be the next-to- last person when using the computer on any given day because shutting down the system and securing the laboratory took about 30 minutes.

[...]

The first programming language we learned for the 650 was the native machine language, the lowest level of programming. Every operation was contained in a ten digit word. A typical instruction may look like 70 1950 0200. The first two digits were the operation code (70 for read a card into memory). The next four digits (1950) was the location of the data to be stored and the last four digits (0200) were the location of the next instruction. Every operation in a program required a separate IBM card so even a simple program such as computing density would take a hundred or more cards . Both program and data were entered into and out of 650 by means of Hollerith Cards.

A short time later, David Decker introduced us to an assembler language that used an alphameric code instead of numbers only to describe the process. An assembler program decoded the symbols and created the machine language code. The finished program was punched on to IBM cards in a binary format. The assembler's name was SOAP for Symbolic Optimal Assembler Program. I used this assembler for about three years until the 650 was replaced with a larger IBM 704. This computer used a 32-bit word, was much faster, had 16,000 words of memory and a large hard drive. The many individual disks in this hard drive were about 30" in diameter were kept in a refrigerated cabinet.

The computer lab was moved from Bagley Hall to the basement of Roberts Hall which was a much larger room that housed both the 704 and the 650. The 650 was soon eased out forcing us to learn a new program language. The recommended language for scientific computing was FORTRAN. (FORmula TRANslation). At this point in time, I learned FORTRAN and used it for the rest of my career at the UW.

Several more computers followed. A building on Brooklyn Avenue south of Pacific was constructed to house the academic computer. When the building was first opened, there was a room on the south side of the first floor that had over 50 keypunches. Two high speed card readers were available to feed your data into the computer. The last main frame computer to occupy this space was a CDC 6700. This machine used 64 bit words and had a memory of about 64,000 words. There were several magnetic tape drives attached to computer and several large hard drives. This computer supported many peripheral stations that permitted a person to communicate with the main frame from a distance.

Oceanography had such a station in the first floor of the Showboat Apartment. This building was torn down in about 1998 to make room for the new Oceanography Building. Because of the large quantity of data I generated, I had an IBM Model 129 Interpreting Key Punch on the Oceanography Barge.

  - MATHEMATICS : Executive Officer: C. B. ALLENDOERFER, 245 Physics Hall : The Department of Mathematics serves the University by offering a wide selection of undergraduate and graduate courses which are deSigned to meet a great variety of mathematical needs. Traditionally, mathematics has been the basic language of physical science and engineering, but recently it has also become of major importance for students in social science, business administration, and biological science. Mathematics is also an essential element of a liberal education, and students from humanities and the arts are encouraged to broaden their education by enrolling in appropriate courses in the Department. [...] SPECIAL FACILITIES. The Laboratory of Statistical Research, directed by Z. W. Birnbaum, prOvides a focus for statistical activity within the University. Through the facilities of the Laboratory, instruction is given for students intending to be profeSSional statisticians, and also for students who plan to use mathematical statistics in other fields such as biology, economics, education, psychology, or sociologv. The Laboratory also provides consulting services to other divisions of the University. The Research Computer Laboratory, directed by D. B. Dekker, is equipped with IBM 6iO and 709 high-speed computers. It prOvides computing services to all portions of the University and is also available to students who are studying programming or numerical analysis."

LCC Instructor Receives Master Of Arts Degree

Lower Columbia instructor Alan Howard received his Master of Arts degree in teaching mathematics from the University of Washington at the end of fall quarter.

Topic of his thesis was "A Computer - Oriented Numerical Mathematics Course for the Community Two-Year College." Work on his degree and thesis was under the direction of Dr. David Dekker of the University's Mathematics Department and Computer Center.

Head of the Lower Columbia data processing department, Instructor Howard studied the classical numerical mathematics to develop a lower division numerical mathematics course that could be taught at the junior college level.

His paper is a collection and analysis of methods suitable for a "pilot" computer mathematics course at the college, and emphasizes the basic theory behind classes of methods and their application to digital computation.

Instructor Howard received his B.S. in mathematics at Portland State College in 1961. He was employed in systems analysis and computer programming for the Boeing Co. and was a research assistant with the University of Washington Computer Center before joining the Lower Columbia faculty in September of 1964.

1963. *The United Nations Treaty Series Project (UNTS Project) started as a vague hunch in a class discussion. The question was how to prove the growth of international institutions in conventional international law. The answer was simple in theory but difficult in practice. We should survey the texts of treaties. If references to international institutions increased, the point was proved; otherwise, disproved. The more treaties we surveyed the more reliable the results would be. There was no money to pay for anything, no special equipment, no extra work space, nothing but the idea and the library and a group of students volunteering to do the job as part of their classwork in international law.*

Two months later, some fifty students had combed through all volumes of the United Nations Treaty Series (UNTS). There were 426 volumes in the autumn of 1963. A few key characteristics were extracted from every one of the 6,734 treaties published up to that time in the UNTS. The students coded these key characteristics on dittoed code sheets. By Christmas I had on my desk a pile of several hundred code sheets filled out by 50 students in as many handwritings. I had no way of guessing the level of accuracy and completeness, let alone usefulness, of the whole exercise.

[...][page 178][...]

Also in 1965, the UNTS Project became part of the regular graduate instruction in international law at the University of Washington. A system was developed (and is still in force) whereby seminar students must combine traditional and quantitative methods in international law. Standard procedures include the handling of UNTS Project printouts, code manuals, and raw data cards. Students also use auxiliary equipment in the computer center as well as desk calculators and other simple devices for minor individual tasks. Measurements and computer-oriented activities must be related to traditional research wherever possible.

1966. *This year saw a gradual shift of emphasis from investment to production. Data enlargement continued by adding identifications of international organizations referred to in treaty texts and identity of registering party, as well as some refinements in the 1965 topic code. The second annual updating was completed in June by adding to the data bank UNTS Volumes 454-503 published between June 1965 and June 1966. Data enlargement and updating having become a routine function of an on-going operation, the main thrust of the work in 1966 concerned new programs for the machine-handling of UNTS data, and analytic work in selected aspects of the law of treaties. Completed were the study of the Canadian UNTS Gap," a special study on the role of military matters in the world's treaty pattern,[12] a general statement of theoretical under- pinnings for the UNTS Project, [13] a paper on information retrieval aspects of the UNTS Project, [14] and an outline of a more general scheme of computerizing international law. [15]*

Two professional meetings on the use of computers in international relations research included the UNTS Project: (1) the special working group on electronic data processing set up by the American Society of International Law; [16] and (2) the Institute on "Computers and the Policy-Making Community" sponsored by the Endowment for International Peace and the U. S. Atomic Energy Commission. [17]

Also in 1966, two graduate student papers on UNTS Project material attracted professional interest: (1) one paper was selected for presentation to a West Coast regional conference [l8] and was then revised and published elsewhere; [19] and (2) the other paper was chosen for presentation to the University of Washington Student International Law Society and then also published elsewhere. [20] By the end of 1966, a total of 15 students found their work referred to by name in UNTS Project publications,[21] and 8 of them more than once. [22]

Finally, the UNTS Project was given a broader institutional base at the University of Washington through the appointment of a joint advisory committee by the Dean of the Law School and the Chairman of the Political Science Department.

1967. *Three new sets of data were added in 1967: (1) date of effect, (2) date of registration and (3) official languages. New work began on multilateral treaties and on treaty history subsequent to registration, e.g. prolongations, terminations, accessions, withdrawals, amendments, and reservations. The annual updating proceeded concurrently with the addition of new data. UNTS Volumes 504-550 were coded. This brought our data bank up to date, covering all UNTS volumes published through December 1967.*

The computer center started developing for the UNTS Project a teletype capacity for instant retrieval between the UNTS Project office and the computer center. This is being done by means of the B-5500 XTAB retrieval program adapted by the computer center of the University of Washington especially to the needs of the UNTS Project. It will be used in addition to the existing capacity of the IBM-7094 for both retrieval and computation. The B-5500 program plus teletype response will cut the waste and the waiting time involved in using the IBM-7094 (or later the IBM-360) for simple retrieval jobs. ***[23][Grateful recognition for imaginative help far beyond routine cooperation is made to the two co-directors of the computer center at the University of Washington, David Dekker and Carl Young, and to the following staff members in particular: Charlene Haug, Elton Hay, Larry Menninga and Monique Rona.]*** *Hunches can then be tested in minutes rather than days. Retrieval also has become a somewhat larger part of UNTS Project operations as more faculty and graduate students use our data bank and as more requests for special data printouts are received from outside. [24]*

Computer Firm Formed

A new computer firm, the Computer Center Corp., has been formed by four University of Washington specialists, it was announced today.

Carl G. Young, director of operations at the university's computer center since 1965, has resigned to become president of the new company, which will specialize in service to scientific firms and industries on a time-sharing basis.

Quarters have been leased in the former Dresslar-Waesche Building at 4057 Roosevelt Way N. E.

Dr. David B. Dekker, who has been faculty director of the University Computer Center since its establishment, is vice president of the new firm.

DEKKER will serve in a consultant capacity during the school year and continue on the university faculty as an associate professor of mathematics and graduate-program adviser in computer sciences. He has resigned his position with the University Computer Center.

C. G. YOUNG

DR. D. B. DEKKER

Richard G. Hamlet, chief systems programmer at the University Computer Center, and Monique R. Rona, chief scientific programmer at the center, have resigned their university positions to join the new firm.

A fifth incorporator is Richard L. Wilkinson, formerly Northwest sales manager of the Digital Equipment Corp.

TIME-SHARING of the capabilities of large, fast and complex central processors will be the principal mode of operation of the corporation, Young said.

The company plans to sell computer time via common-carrier lines from teletype machines or other electronic typewriter devices situated in customer offices.

The user will be able to communicate data directly to the computer and receive almost instantaneous reply in his own office.

The Computer Center Corp. plans to be in operation about November 1.

Westside S & L Leads July Gain

Westside Federal Savings & Loan Association in July led a local reversal of the usual July trend toward a decline in net savings.

Net savings rose only $200,000 last month in the 23 associations affiliated with the Seattle League of Insured Savings Associations. Westside, a member of the association, registered a gain of $433,000.

In 1966, when there was a tight money situation comparable to this year, league institutions suffered a July loss of $6.7 million.

The United Nations Treaty Series Project - By PETER H. ROHN UNIVERSITY OF WASHINGTON

[...]

1963. The United Nations Treaty Series Project (UNTS Project) started as a vague hunch in a class discussion. The question was how to prove the growth of international institutions in conventional international law. The answer was simple in theory but difficult in practice. We should survey the texts of treaties. If references to international institutions increased, the point was proved; otherwise, disproved. The more treaties we surveyed the more reliable the results would be. There was no money to pay for anything, no special equipment, no extra work space, nothing but the idea and the library and a group of students volunteering to do the job as part of their classwork in international law.

Two months later, some fifty students had combed through all volumes of the United Nations Treaty Series (UNTS). There were 426 volumes in the autumn of 1963. A few key characteristics were extracted from every one of the 6,734 treaties published up to that time in the UNTS. The students coded these key characteristics on dittoed code sheets. By Christmas I had on my desk a pile of several hundred code sheets filled out by 50 students in as many handwritings. I had no way of guessing the level of accuracy and completeness, let alone usefulness, of the whole exercise.

[...][page 178][...]

Also in 1965, the UNTS Project became part of the regular graduate instruction in international law at the University of Washington. A system was developed (and is still in force) whereby seminar students must combine traditional and quantitative methods in international law. Standard procedures include the handling of UNTS Project printouts, code manuals, and raw data cards. Students also use auxiliary equipment in the computer center as well as desk calculators and other simple devices for minor individual tasks. Measurements and computer-oriented activities must be related to traditional research wherever possible.

1966. This year saw a gradual shift of emphasis from investment to production. Data enlargement continued by adding identifications of international organizations referred to in treaty texts and identity of registering party, as well as some refinements in the 1965 topic code. The second annual updating was completed in June by adding to the data bank UNTS Volumes 454-503 published between June 1965 and June 1966. Data enlargement and updating having become a routine function of an on-going operation, the main thrust of the work in 1966 concerned new programs for the machine-handling of UNTS data, and analytic work in selected aspects of the law of treaties. Completed were the study of the Canadian UNTS Gap," a special study on the role of military matters in the world's treaty pattern,[12] a general statement of theoretical under- pinnings for the UNTS Project, [13] a paper on information retrieval aspects of the UNTS Project, [14] and an outline of a more general scheme of computerizing international law. [15]

Two professional meetings on the use of computers in international relations research included the UNTS Project: (1) the special working group on electronic data processing set up by the American Society of International Law; [16] and (2) the Institute on "Computers and the Policy-Making Community" sponsored by the Endowment for International Peace and the U. S. Atomic Energy Commission. [17]

Also in 1966, two graduate student papers on UNTS Project material attracted professional interest: (1) one paper was selected for presentation to a West Coast regional conference [l8] and was then revised and published elsewhere; [19] and (2) the other paper was chosen for presentation to the University of Washington Student International Law Society and then also published elsewhere. [20] By the end of 1966, a total of 15 students found their work referred to by name in UNTS Project publications,[21] and 8 of them more than once. [22]

Finally, the UNTS Project was given a broader institutional base at the University of Washington through the appointment of a joint advisory committee by the Dean of the Law School and the Chairman of the Political Science Department.

1967. Three new sets of data were added in 1967: (1) date of effect, (2) date of registration and (3) official languages. New work began on multilateral treaties and on treaty history subsequent to registration, e.g. prolongations, terminations, accessions, withdrawals, amendments, and reservations. The annual updating proceeded concurrently with the addition of new data. UNTS Volumes 504-550 were coded. This brought our data bank up to date, covering all UNTS volumes published through December 1967.

The computer center started developing for the UNTS Project a teletype capacity for instant retrieval between the UNTS Project office and the computer center. This is being done by means of the B-5500 XTAB retrieval program adapted by the computer center of the University of Washington especially to the needs of the UNTS Project. It will be used in addition to the existing capacity of the IBM-7094 for both retrieval and computation. The B-5500 program plus teletype response will cut the waste and the waiting time involved in using the IBM-7094 (or later the IBM-360) for simple retrieval jobs. **[23][Grateful recognition for imaginative help far beyond routine cooperation is made to the two co-directors of the computer center at the University of Washington, David Dekker and Carl Young, and to the following staff members in particular: Charlene Haug, Elton Hay, Larry Menninga and Monique Rona.]** Hunches can then be tested in minutes rather than days. Retrieval also has become a somewhat larger part of UNTS Project operations as more faculty and graduate students use our data bank and as more requests for special data printouts are received from outside. [24]

Early in 1967, the second meeting of the automation working group of the American Society of International Law gave the UNTS Project major coverage as one of two "mature projects" in the field.

F, #140333, b. 18 October 1916

Last Edited=2 Feb 2005

Evelyn Eirene **Ponsonby** was born on 18 October 1916.[1] She is the daughter of Guy Evelyn **Ponsonby** and Irene Rodger **Greig**.[1] She married David Bliss **Dekker**, son of Albert Henry **Dekker**, on 2 October 1942.[2]

She was educated at University of California, California, U.S.A.[G,2] From 2 October 1942, her married name became Dekker.[2] She lived in 2003 at 1325 North Allen Place, #135, Seattle, Washington, U.S.A.[G,1]

Children of Evelyn Eirene Ponsonby and David Bliss Dekker

1. David Bliss **Dekker**[2]
2. Donald Kreig **Dekker**[2]

Relatives

John Dekker (1927 - 2018) : Younger brother -

[HL005I][GDrive]

John Henry Dekker, age 90, of Hendersonville, NC went home to be with his lord on Saturday June 16, 2018. John was born August 16, 1927 in Glendale California; the son of the late Albert Orno Dekker and Rose-Marie Moore Dekker. In addition to his parents he was preceded in death by two of his children, daughter Carrie Lynn Dekker Cotoli and son Frank Albert Dekker, his two **brothers David Bliss Dekker and Albert Henry Dekker** and sister Mary Elizabeth (Betsy) Dekker Light and husband Shelby. John is survived by his Loving Wife, of 49 years, Virginia Lind Dekker, his three children, Son Jan Garrett Dekker and his wife Ruby, his Daughter Laurie Dekker Jobe and her husband Bill, and Daughter Rose Mary Dekker, his grandchildren Heather Prince Barrios, Katherine Bree Shaffstall, Kirstie Ann Kreeger, Thomas Edward Dekker, Sara Elizabeth Cusack, Travis James Cusack, Paul Bruno Cotoli, and multiple great grandchildren who loved and adored him. John lived a great loving life that he shared with everyone around him. He regaled his friends with stories of his life that were so entertaining that he was often asked for more stories. John was always kind and willing to lend a helping hand to anyone who asked. Over the years of his geophysical work, he developed a lasting and deep respect for the earth. As a young boy of 12 he started mowing lawns in the neighborhood and earned enough money to buy a car at age 16, following which he began working as a soda jerk and fry cook at the Westport Beach Club, Long Beach, CA, and later worked making rubber gaskets for wing tanks in airplanes during WWII. At 17 he graduated from high school and attempted to enlist in the Navy but was not accepted because he was deaf in one ear. As a result, he began a summer job as a Chevron station manager in Tuolumne Meadows, Yosemite National Park. In the fall of 1945 he was drafted into the Army as a private (they said he was faking his deafness). He advanced to battalion supply sergeant with the 11th Airborne Division while on occupation duty in Sendai, Japan and was honorably discharged in 1947. John received a BS degree in geology from The University of Washington at Seattle in 1950. He went to work for United Geophysical Corp. in California and then moved and worked across the country throughout the Rockies to coast of the Gulf of Mexico performing every job on a seismic crew searching for oil and gas and advanced to Party Chief. In 1956 he went to work for Chevron Oil in New Orleans as a geophysicist and in 1960 for Union Oil of California as Division Geophysicist. In 1965 he became a geophysical consultant and worked for a dozen different oil and gas companies. **Also, as a consultant he performed many plant site studies for atomic powered electric plants.** As a loving and dedicated father and scout master he led his family on many camping vacations to our Great Beautiful National Parks. Many summers were spent with his family at Philmont Scout Ranch. In 2000 he retired and in 2006 moved to Hendersonville, North Carolina where he volunteered with "Disability Partners", teaching computer skills to disabled people. He served on the Board of Indian Hill Home Owners Association, Hendersonville Board of Adjustments and was active in the Republican Party. In lieu of flowers, the family suggests that donations in John's memory be directed to Blue Ridge Humane Society of Hendersonville, NC, 88 Centipede Ln, 28792. A memorial service will be held in Flat Rock, NC at St John in the Wilderness Episcopal Church 1895 Greenville Hwy at 10:00 am on June 30th, reception to follow service.

Emmie de Wit

Nationality

Dutch

Alma mater

Erasmus University Rotterdam (PhD)

Scientific career

Fields

Viral pathogenesis

Institutions

Rocky Mountain Laboratories

Emmie de Wit is a Dutch-American virologist. She is chief of the molecular pathogenesis unit at the Rocky Mountain Laboratories. Her research combines pathogenesis studies with detailed molecular analyses to identify molecular determinants of severe respiratory tract disease within the virus and the host.

Education[edit]

Emmie de Wit is from the Netherlands.[1] **She received her Ph.D. in virology in 2006 fr**om Erasmus University Rotterdam. Her research focused on the replication, pathogenesis and transmission of influenza A virus.[2] Her dissertation was titled *Molecular determinants of influenza A virus replication and pathogenesis*.[3]

[If she was 26 when she got her PhD in 2006, that would suggest a birth date cloer to 1980

Career[edit]

In 2009, de Wit moved to Heinz Feldmann's Laboratory of Virology at the Rocky Mountain Laboratories (RML) to research in the biosafety level 4 laboratory. Here, she focused on the pathogenesis of and countermeasures against Nipah virus, the Middle East Respiratory Syndrome Coronavirus and the 1918 H1N1 influenza A virus (Spanish flu).[2] In 2012, she received a Fellows Award for Research Excellence (FARE) for her research on modeling the transmission cycle of the deadly Nipah virus.[4] From 2014 to 2015, de Wit spent 4 months in a field lab in Monrovia, Liberia in charge of patient diagnostics for several Ebola Treatment Units in the area, to help contain the Ebola virus epidemic in Liberia. Currently, de Wit's research aims to combine pathogenesis studies with detailed molecular analyses to identify molecular determinants of severe respiratory tract disease within the virus and the host. She is chief of the molecular pathogenesis unit at RML.[2]

Perry Backus

For decades, Rocky Mountain Laboratory scientists Vincent Munster and Emmie de Wit have been honing the skills they would use in helping in this year's fight against a global pandemic.

That scientific expertise didn't go unnoticed.

The married couple from Hamilton was recently selected as two of four recipients of the American Association for Advancement of Science's Golden Goose Award. The award recognizes the benefits of federally-funded research by highlighting examples of studies that led to breakthroughs resulting in significant societal impacts.

The award's focus this year was on a group of National Institutes of Health scientists who used their collective knowledge gained in studying other dangerous coronavirus outbreaks around the world to respond quickly to the COVID-19 pandemic.

While the couple works in separate RML labs, the common thread of their research involves investigating outbreaks. They work with animals to learn about viruses and then create tests to determine if vaccine candidates and treatments have the potential to work in humans.

They are among a small core of researchers who study coronaviruses. Before COVID-19 was even a blip on the radar screen, their work was unlocking mysteries about how the viruses operated and ways they could be treated.

At about the same time the first cases of COVID-19 were reported in Wuhan, China last December, a study led by de Wit was published that showed the experimental antiviral drug remdesivir was effective in treating rhesus macaques infected with the Middle East respiratory syndrome (MERS) coronavirus.

By April, de Wit's team showed that it also worked on the virus that caused COVID-19.

The federal Food and Drug Administration issued an emergency-use authorization for the drug to treat COVID-19 patients requiring hospitalization in May.

Munster's RML research team was one the first to investigate MERS in 2012 when it appeared in Arabian Desert camel handlers. They found that while camels wouldn't get ill with the virus, they spread it effectively to humans.

Munster's team is currently involved in several COVID-19 development programs, including the Oxford-AstraZeneca vaccine that could be next in line for an emergency authorization.

The first doses of COVID-19 vaccine are expected to arrive in Ravalli County this week. For that to happen so quickly, Munster said the stars needed to align just right.

"Surprised isn't the right word for us that this has happened," he said. "We're all aware of the new technologies that have been developed. Everything still needed to work and everything has. The laboratory work, the human clinical trials, all these things have lined up in record speed. It worked out in the way that it was planned. Nothing hit a snag. That's really amazing."

Both de Wit and Munster said it's important for the general public to understand that the building blocks for this rapid development of a vaccine were put in place decades ago.

"If you are involved in it, it all makes sense," Munster said. "For the general public, it seems unprecedented."

Since the 2014 Ebola outbreak, public and private partnerships between scientists and pharmaceutical companies have been working to shorten the time frame for developing new vaccines so they can make a difference when a new pathogen appears.

"One of the big differences from the development of previous vaccines was the resources that were available this time," de Wit said. "Everyone in the research community and all the pharmaceutical companies wanted to make a vaccine happen…The FDA made sure they were ready to make approvals so the next step could happen. And there were a lot of people who were willing to participate in vaccine trials."

"Enrolling 30,000 people in vaccine candidate trials is quite unprecedented," Munster said.

Munster and de Wit said all of this couldn't happen without the cooperation of research teams from around the world.

"People have this old-fashioned idea about science," de Wit said. "They think it's one brilliant person who has this brilliant idea that's made in a light bulb. That's not really how science works. You really need to put a lot of brains and hands together."

While the couple is appreciative of the recent award they were presented, both said the credit really belongs to all the people who work at Rocky Mountain Laboratories.

The two have been working at the Hamilton facility since 2009.

"We think we are extraordinarily blessed to be able to live here," Munster said. "We have all the resources that we need to be able to do our work and then we can still go outside and enjoy nature."

Since the pandemic's onset, the couple said they have been extremely diligent in maintaining social distancing. The only time they go out into a public space is a 7 a.m. grocery shopping trip on Sunday mornings.

"For us, this has been a crazy year," de Wit said. "While other people are having to struggle to stay indoors, we have been able to do what we love by going to work. We love figuring out what kind of disease this is and what we can do to prevent people from getting sick."

They hope their neighbors will continue to hunker down and do everything they can to stay safe for the next few months until the vaccine becomes readily available.

"With the vaccines, I think we are really getting close to the end of it," Munster said. "Everyone just needs to be strong for the next couple of months until they can get vaccinated. People need to keep wearing their masks, keeping their distance and practice proper hygiene."

The two scientists who have spent their careers studying some of the most infectious diseases known to the world are certain that masks work to control

the spread of virus.

“We think it’s very simple concept,” Munster said. “This virus replicates the most in people’s noses. It’s transmitted when people inhale and exhale. The moment you wear a mask, it’s harder to get enough virus particles for someone to become infected.”

“Masks are such an easy thing,” de Wit said. “You just put them on before you go into the store. It’s something that everyone can do to keep everyone safe. We’re not all scientists who can work on a vaccine, but this is something that everyone can do to try to keep each other a little safer.”

“People should have the freedom of not being exposed to someone else’s virus,” Munster said.

[**Dr. Howard Martin Temin (born 1934)**]

Renato Dulbecco (/dʌlˈbɛkoʊ/ dul-BEK-oh,[4][5] Italian: [reˈnaːto dulˈbɛkko, -ˈbek-]; February 22, 1914 – February 19, 2012)[6] was an Italian–American virologist who won the 1975 Nobel Prize in Physiology or Medicine for his work on oncoviruses, which are viruses that can cause cancer when they infect animal cells.[7][8][9][10][11][12][13][14] He studied at the University of Turin under Giuseppe Levi, along with fellow students Salvador Luria and Rita Levi-Montalcini, who also moved to the U.S. with him and won Nobel prizes. He was drafted into the Italian army in World War II, but later joined the resistance.

[...]

Early life[edit]

Dulbecco was born in Catanzaro (Southern Italy), but spent his childhood and grew up in Liguria, in the coastal city Imperia. He graduated from high school at 16, then moved to the University of Turin. Despite a strong interest in mathematics and physics, he decided to study medicine. At only 22, he graduated in morbid anatomy and pathology under the supervision of professor Giuseppe Levi. During these years he met Salvador Luria and Rita Levi-Montalcini, whose friendship and encouragement would later bring him to the United States. In 1936 he was called up for military service as a medical officer, and later (1938) discharged. In 1940 Italy entered World War II and Dulbecco was recalled and sent to the front in France and Russia, where he was wounded. After hospitalization and the collapse of Fascism, he joined the resistance against the German occupation.[13]

Career and research[edit]

After the war he resumed his work at Levi's laboratory, but soon he moved, together with Levi-Montalcini, to the U.S., where, at Indiana University, he worked with Salvador Luria on bacteriophages. In the summer of 1949 he moved to Caltech, joining Max Delbrück's group (see Phage group). There he started his studies about animal oncoviruses, especially of polyoma family.[15] In the late 1950s, he took [**Dr. Howard Martin Temin (born 1934)**] as a student, with whom, and together with [**Dr. David Baltimore (born 1938)**], he would later share the 1975 Nobel Prize in Physiology or Medicine for "their discoveries concerning the interaction between tumour viruses and the genetic material of the cell." Temin and Baltimore arrived at the discovery of reverse transcriptase simultaneously and independently from each other; although Dulbecco did not take direct part in either of their experiments, he had taught the two methods they used to make the discovery.[16]

Throughout this time he also worked with Marguerite Vogt. In 1962, he moved to the Salk Institute and then in 1972 to The Imperial Cancer Research Fund (now named the Cancer Research UK London Research Institute) where he was first appointed associate professor and then full professor.[17] As many Italian scientists Dulbecco did not have any PhD because it was not existent in the Italian higher education system (until when it was introduced in 1980[18]). In 1986 he was among the scientists who launched the Human Genome Project.[19][20] From 1993 to 1997 he moved back to Italy, where he was president of the Institute of Biomedical Technologies at C.N.R. (National Council of Research) in Milan. He also retained his position on the faculty of Salk Institute for Biological Studies. Dulbecco was actively involved in research into identification and characterization of mammary gland cancer stem cells until December 2011.[21] His research using a stem cell model system suggested that a single malignant cell with stem cell properties may be sufficient to induce cancer in mice and can generate distinct populations of tumor-initiating cells also with cancer stem cell properties.[22] Dulbecco's examinations into the origin of mammary gland cancer stem cells in solid tumors was a continuation of his early investigations of cancer being a disease of acquired mutations. His interest in cancer stem cells was strongly influenced by evidence that in addition to genomic mutations, epigenetic modification of a cell may contribute to the development or progression of cancer.

Nobel Prize[edit]

Dulbecco and his group demonstrated that the infection of normal cells with certain types of viruses (oncoviruses) led to the incorporation of virus-derived genes into the host-cell genome, and that this event lead to the transformation (the acquisition of a tumor phenotype) of those cells. As demonstrated by [**Dr. Howard Martin Temin (born 1934)**] and [**Dr. David Baltimore (born 1938)**], who shared the Nobel Prize with Dulbecco, the transfer of viral genes to the cell is mediated by an enzyme called reverse transcriptase (or, more precisely, RNA-dependent DNA polymerase), which replicates the viral genome (in this case made of RNA) into DNA, which is later incorporated in the host genome.

Oncoviruses are the cause of some forms of human cancers. Dulbecco's study gave a basis for a precise understanding of the molecular mechanisms by which they propagate, thus allowing humans to better fight them. Furthermore, the mechanisms of carcinogenesis mediated by oncoviruses closely resemble the process by which normal cells degenerate into cancer cells. Dulbecco's discoveries allowed humans to better understand and fight cancer. In addition, it is well known that in the 1980s and 1990s, an understanding of reverse transcriptase and of the origins, nature, and properties of human immunodeficiency virus (HIV, of which there are two well-understood serotypes, HIV-1, and the less-common and less virulent HIV-2), the virus which, if unchecked, ultimately causes acquired immunodeficiency syndrome (AIDS), led to the development of the first group of drugs that could be considered successful against the virus, the reverse-transcriptase inhibitors, of which zidovudine is a well-known example. These drugs are still used today as one part of the highly-active antiretroviral therapy drug cocktail that is in contemporary use.

Other awards[edit]

In 1965 he received the Marjory Stephenson Prize from the Society for General Microbiology. In 1973 he was awarded the Louisa Gross Horwitz Prize from Columbia University together with Theodore Puck and Harry Eagle. Dulbecco was the recipient of the Selman A. Waksman Award in Microbiology from the

National Academy of Sciences in 1974.[23] He was elected a Foreign Member of the Royal Society (ForMemRS) in 1974.[2]

He died three days before his 98th birthday.

Birth 7 Jul 1873 in New Castle County, Delaware, USA

Death 15 Dec 1954 (aged 81) in Greenville, New Castle County, Delaware, USA

Also goes by:

- **Eugene E (for Éleuthère) du Pont** ; See http://dla.library.upenn.edu/dla/pacscl/ead.pdf?id=PACSCL_HML_2656
- French: **Eugène du Pont de Nemours**

Father is 🌐 **Eugene E. du Pont Sr. (1840-1902)** , "an American businessman who served as the first head of the modern-day DuPont corporation."

Grandfather : Alexis Irénée du Pont

Great Grandfather : 🌐 **Éleuthère Irénée du Pont de Nemours (1771 - 1834)**

(**source** : http://dla.library.upenn.edu/dla/pacscl/ead.pdf?id=PACSCL_HML_2656)

Eugene du Pont Jr. *was born July 7, 1873 in Wilmington, Delaware. He was the son of* 🌐 **Eugene E. du Pont Sr. (1840-1902)** *and Amelia Elizabeth du Pont (1842-1917), and a great grandson of E.I. du Pont de Nemours& Company founder,* 🌐 **Éleuthère Irénée du Pont de Nemours (1771 - 1834)** *Eugene's father was the president of theDuPont Company from 1889 until his death in 1902.Eugene du Pont Jr. papers- Page 4 -Eugene attended St. Paul's School in Concord, New Hampshire, from 1888 until 1892, and later Brownand Nichols School in Cambridge, Massachusetts from 1892 to 1893. In 1897, he received a degree fromHarvard University. Not long after graduation, Eugene joined the DuPont Company as assistant to thepresident in the administrative office. After the death of his father and company president Eugene E. duPont in 1902, he was named assistant director of sales for the E.I. du Pont de Nemours Powder Companyin January 1903, a subsidiary of the DuPont Company. As assistant director of sales, Eugene traveledextensively for fifteen years to increase the sales of explosives in the central west. In February 1913, hetook a leave of absence from the company and resigned five months later. Eugene was elected a directorof E.I. du Pont de Nemours & Company on March 12, 1917, a position in which he remained until hisdeath.Eugene was also a director of the Equitable Security Trust Company in Wilmington, and heldmemberships in various societies and clubs, including the Sons of the American Revolution, WilmingtonClub, DuPont Country Club, Aurora Gun Club, Woodmont Rod and Gun Club, and several others. InJanuary 1913, he married Ethel Pyle of Wilmington and had four children, one of whom, Ethel, marriedFranklin D. Roosevelt, Jr. in 1937. Eugene E. du Pont Jr. died December 15, 1954.*

Uncle : Dr Alexis Irenee Du Pont (1843 - 1904)

His cousin(s) includes **Eugene Éleuthère du Pont (born 1882)** (son of his uncle **Dr Alexis Irenee Du Pont (1843 - 1904)**).

DAUGHTER - Ethel du Pont

THE SUN, BALTIMORE, THURSDAY MORNING, DECEMBER 16, 1954

DU PONT DIES AT HIS FARM

Eugene Was Director Of Family's Chemical Firm

Wilmington, Del., Dec. 15 (AP)—Eugene du Pont, a great-grandson of the founder of the E. I. du Pont de Nemours & Co. chemical firm, died today at his farm home near here. He was 81.

A member of the du Pont board, he started with the firm in 1897 as assistant to his father, Eugene du Pont, who was president at the time. From 1902 to 1913 he was assistant director of sales.

His wife, the former Ethel Pyle, died November 22. She was 73.

Du Pont's daughter, Ethel, once was married to Franklin D. Roosevelt, Jr., son of the late President. She is now the wife of Benjamin S. Warren, Jr., of Gross Point, Michigan.

Interested In Hunting

A noted agriculturalist and philanthropist, du Pont also had an absorbing interest in hunting which took him all over the world.

He recently gave more than $1,000,000 and a site to build the Eugene du Pont Memorial Convalescent Home as part of the Wilmington Memorial Hospital to honor his father. This project is not yet completed.

Du Pont is survived by three other children—Eugene 3d and Nicholas R., both of Wilmington, and Mrs. Aimes Weatherhill, of Chestnut Hill, Pa., and a sister, Mrs. Amy E. du Pont, of Santa Barbara, Cal.

Aurora Gun Club Records :

http://dla.library.upenn.edu/cocoon/dla/pacscl/ead.pdf?id=PACSCL_HML_2488

"By the fiftieth anniversary shoot of the Aurora Gun Club, shooting was taking place near 'Dogwood,' the home of ***Eugene E. du Pont****. On November 9, 1952, The Wilmington Evening Journal covered an anniversary shoot as even by then Aurora had the distinction of being one of the oldest active gun clubs*

in the United States. The Evening Journal went on to mention that members of the club in 1952 were: Eugene du Pont, William du Pont, Eugene E. du Pont, W. Glasgow Reynolds, Isaac Fog, W.R. Ellis, Maholon Milliken, Harold Schutt, Porter Schutt, Fagan Simonton, Karl Mollin, S. G. Baker, William Jones, James T. Skelley, Ted Doremus, James H. Dunbar, Harry Prettyman, W. G. Wood, Bernard Peyton, Edward Porter, Walter S. Carpenter Jr., Noel Bannard, Clark Davis and finally Stuart Groves. For this special anniversary shoot, a hot tamale luncheon was flown in from California buy members Ellis and Milliken.

The year 1955 saw the end of an era with the passing of Eugene du Pont late in 1954, a new president would need to be elected. A meeting was held at 'Dogwood' to determine who the next president would be. At the meeting, Ted Doremus was elected second president of the club. To pay homage to their late president, Sam Baker met with officials of the newly constructed Eugene du Pont Memorial Hospital on the site of 'Pelleport' who suggested that they fund the construction of a covered passageway for nurses walking from their dormitory to the hospital proper as an appropriate tribute to Eugene du Pont."

Director of Phillips Petroleum Co. 1917 to 1955

https://en.wikipedia.org/wiki/Phillips_Petroleum_Company

The Phillips Petroleum Company was incorporated on June 13th, 1917, by brothers Lee Eldas ("L.E.") Phillips and Frank Phillips, of Bartlesville, Oklahoma, U.S.A.[4][5] Their younger brother, Waite Phillips, was the benefactor of Philmont Scout Ranch. The company was headquartered in Bartlesville, Oklahoma.[6][7]

Phillips Petroleum rapidly became a fully integrated oil company that included oil and gas production, crude oil pipelines and refineries, and marketing of petroleum products.

Phillips Petroleum became heavily involved in the natural gas industry immediately after the discovery of the Panhandle gas field of Texas and the Hugoton field in Kansas. By 1925, it was the largest producer of natural gas liquids (NGL) in the United States.[1]

In 1927, Phillips started up its first petroleum refinery in Borger, Texas, designed to produce gasoline as an automotive fuel. The refinery also produced other petroleum fractions (e.g., kerosene, fuel oils). It opened its first service station, to sell gasoline, in Wichita, Kansas on 19 November 1927. In 1930, the company developed its "Phillips 66" trademark: according to company lore, a Phillips official was road-testing the company's newest gasoline, commented that the car was going "like 60" when his driver replied "Sixty nothing ... we're doing 66!", all while driving on U.S. Highway 66 in Oklahoma near Tulsa, resulting in the number 66 superimposed on the U.S. Highway symbol for Route 66.[1][8]

Frank Phillips served as president of the company until 1938.[9] He then turned over the presidency to Kenneth S. "Boots" Adams, but continued as chairman of the board until 1949, when he was 76 years old.[citation needed]

In 1942, the company bought more than 250,000 acres in the Hugoton-Panhandle gas fields and a 25 percent interest in the Panhandle Eastern Pipeline Co.[1] In 1954, the U.S. Supreme Court decided the landmark case of Phillips Petroleum vs. State of Wisconsin which held that under the Natural Gas Act,[10] the federal government should regulate the prices which natural gas producers charge when selling gas at the wellhead.[11] Phillips then divested itself of the Panhandle Eastern Pipeline Interest, but remained a major supplier of natural gas.[1]

World War II greatly stimulated the demand for petroleum products, especially high-octane aviation fuel and jet fuel. Phillips turned to technology to increase the octane rating of fuels for use in advanced engines. The company invented an HF alkylation process in 1940.[12] The American petrochemical industry took off, first making such as styrene, ethylene, propylene and butadiene.[1] After the war, it formed a subsidiary, Phillips Chemical Co., which entered the fertilizer business by producing anhydrous ammonia from natural gas.[13] The company then built a complex on the Houston Ship Channel devoted to making petrochemicals and polymers.[1]

During the 1960s, Phillips expanded its international operations, particularly with exploration in Canada, Venezuela, and Colombia. It discovered the Ekofisk gas field in the North Sea in 1969.[1]

1981 -To fend off hostile takeovers, Conoco agrees to be acquired by E.I. du Pont de Nemours and Company (DuPont) for $7.4 billion.

https://www.courtlistener.com/opinion/2090367/mayer-v-adams/

https://www.encyclopedia.com/social-sciences-and-law/economics-business-and-labor/businesses-and-occupations/e-i-du-pont-de-nemours-company

In addition to mergers and acquisitions, Du Pont became heavily involved in joint ventures. Du Pont had agreements with P. D. Magnetics to develop, manufacture, and sell magnetic tape. It also became involved with PPG Industries to manufacture ethylene glycol. Aided by Olin Corporation, it planned to construct a chlor/alkali production facility. Du Pont also forged extensive connections with Japanese industry. The 1980s united them with Sankyo Company (to develop, manufacture, and market Pharmaceuticals), Idemitso Petrochemicals (to produce and market butanediol), Mitsubishi Gas Chemical Company, and Mitsubishi Rayon Company. Furthermore, Du Pont established connections in Europe. They became partners with N.V. Phillips (to produce optical discs), EKA AB (to produce and market the Compozil chemical system for papermaking processes), and British Telecom (to develop and manufacture optoelectronic components).

Du Pont reacted to the depressed market in textiles by arranging mergers and acquisitions of other companies in other industries. Du Pont's takeover of the Conoco Oil company (the United States's number two petroleum firm) was the largest merger in history. Issues of anti-trust were prevalent in negotiation for the merger, but in the end Du Pont bought Conoco for $7.8 billion. Du Pont merged with Conoco to protect itself from the rise in crude oil prices. As oil supplies dwindled, a supply of Conoco oil and coal as raw material for Du Pont's chemicals provided a competitive advantage. Conoco's sites in Alberta, Canada, and off the north slope of Alaska provided large amounts of these resources. Du Pont's only disadvantage in the Conoco takeover was the introduction of Edgar Bronfman, chairman of the Seagram Company, the world's largest liquor distiller, into a minority position in Du Pont-Conoco. Conoco had been a major acquisition target for Seagram. The merger left Seagram with 20 percent of Du Pont. Bronfman saw himself as a long-term investor in Du Pont and desired an important voice in the company's direction. However, Seagram and Du Pont arrived at an agreement whereby Seagram could not purchase more than 25 percent of Du Pont stock until 1991.

Growth and greater financial security came to Du Pont in 1980 when they bought Remington Arms, a manufacturer of sporting firearms and ammunition. The Remington Arms unit of Du Pont made a number of multi-million dollar contracts with the army to operate government-owned plants. Du Pont also expanded its scope in the early 1980s with other major purchases. New England Nuclear Corporation, a leading manufacturer of radioactive chemicals for medical research and diagnosis, was acquired in April of 1981, and Solid State Dielectrics, a supplier of dielectric materials used in the manufacture of multilayer capacitors, was acquired in April of 1982.

a. Trust 3044 was created by Mrs. Schutt's father (Eugene E. duPont, who was the son of Alexis Irenee duPont) in 1940, with Wilmington Trust Co. (WTC) as trustee. At Mrs. Schutt's death, this trust was divided into four separate trusts for her children (providing for quarterly income distributions to each child). At each child's death, his or her trust would pass free of trust to the child's issue, subject to age restrictions. The trust agreement provided for the appointment of an "advisor of the trust" who could refuse consent to broadly specified investment actions (including the decision to sell assets). Mrs. Schutt appointed decedent and her father as the advisors. After Mrs. Schutt's father's death in 1966, decedent served as the sole advisor until his death.

1919 - Eugene E du Pont becomes a director of Phillips Petroleum

Not only estates, but also yachts were a symbol of the Du Ponts during the Twenties.The Delaware family owned more of them than any other family in America. Irénée owned the 60-foot-long Icacos; Lammot, his 76-foot Nemea; A. Felix, Jr., his 73-footOrthia; E. Paul, his 58-foot Theano; Ernest, his 74-foot Edris and 38-foot Ponjola; ***Eugene E., his 50-foot High Tide;*** *Henry B., his 54-foot Nor' Easter; Henry F., his 35-foot Sea Urchin; Coly, his Tech I, Tech II, and Tech III; his son Francis V., his 84-footTech Jr.; and Alfred, his 125-foot Nenemoosha and the 101-foot Gadfly, the last one forscurrying over Florida swamps. Du Pont in-laws also steamed through the high seas,Donaldson Brown of G.M. in his 149-foot Oceania, Ruly Carpenter in his 121-footGalaxy, and his brother, Walter Carpenter (then Du Pont treasurer and married to a former Du Pont governess) in his 65-foot Grey Gull.*

During the Twenties, major newspapers often ran stories of the gay times enjoyed by the rich on their yachts. In 1924, for example, Coleman du Pont's fishing trip with his son and two friends off the Florida coast was duly carried by the New York Times, as if Coly's landing of a 600-pound shark rivaled in heroics and importance the world-shaking events of the day. Again, in 1927, when E. Paul's wife slipped off a bobbingyacht into the Delaware River and had to swim to shore, her feat was recorded by history.

Some of the family were infected with the aviation craze sweeping the country sinceL indbergh's flight and became early pioneers of the new industry. Henry B. du Pont owned the first private plane licensed by the Department of Commerce. Richard C. duPont, son of A. Felix du Pont, was so fascinated with soaring planes that he became oneof the country's leading experts on gliders, while his brother, A. Felix, Jr., casually flew by plane every day to work in Camden, New Jersey, where he inspected aviation finishes in the paint department.

In 1927 Henry B. opened the Du Pont Airport just outside Wilmington, and rumors soon reached New York that Giuseppe M. Bellanca, one of the world's foremost designers of monoplanes, was being lured to Wilmington from his Staten Island plant.The Du Ponts were offering a landing field with 1,100 feet of Delaware River frontageand a complete factory on 350 acres of land only fifteen minutes from the Du Pont Hotel.By the following January the rumors were confirmed with the announcement that the Italian-born designer, after failing to interest Henry Ford, had accepted the presidencyof a $1 million company established by Henry B. du Pont. "Businessmen here,"commented the New York Times, "consider it significant that members of the group soclosely identified with General Motors, the greatest rival of Henry Ford, should be following him into the aircraft industry."108 "Significant" was an understatement. Henry B.'s Atlantic Aviation became the largest business aircraft sales and service organization in the world, spurring Henry's substantial investments in helping developTrans World Airlines, North American Aviation, and Bendix Aviation.

Henry B. du Pont's airport often became a center of suspense in the late Twenties. Once in 1928 A. Felix, Jr., who had joined the Army Air Corps, was overdue in a flight home from his Texas training camp. A mist had developed near Wilmington, and, as these were the days before electronic guidance systems, the waiting Du Ponts were frantic with worry. Finally, Felix's father could stand the suspense no longer; he mounted a plane and flew off into the clouds in search of his son. High above the field,Felix peered through the clouds, anxious over added dangers that would come with night. Then just as dusk approached, the white and gold plane of young Du Pont was sighted.Another incident, although of a less personal nature, occurred a year later. Charles Lindbergh, the famous "lone eagle," flew in for a secret conference with the Du Pont Company. The subject was a revolutionary new idea—rocket power. At the Du Pont headquarters Lindbergh explained that black powder could be used in solid-propellant rockets. He tried to capture their interest by suggesting some immediate practical application. "Now, we could develop a rocket that could be attached to a plane for the purpose of giving it one minute of thrust in case of engine failure on takeoff, thus avoiding having to land it in a city or in trees."109The Du Ponts were openly dubious, expressing the opinion that there seemed no future in rockets connected with airplanes. A month later Lindbergh received a final letter of rejection, which claimed that "to equal the thrust of one minute of a Waspengine would require about 400 pounds of black powder, and the heat would be so intense that the powder would have to be burned in a fire-brick combustion chamber."110

What escaped the Du Ponts, however, was the possibility of liquid propellant, which needed a metal lining only 1/32 of an inch thick. Goddard, "the father of modern rocketry," knew this and, after talking with Lindbergh, visited Wilmington the day before Thanksgiving and was interviewed by three Du Pont laboratory men."I realized soon," he wrote shortly thereafter, "that the object of this questioning was... to find every last detail of the rocket I have developed during the last nine years, and after I saw this I avoided further questions as to these construction details, as much as possible."111 "All Goddard took away from it was the conviction," wrote one author,"that the Du Pont people, far from being interested in underwriting his work, were only interested in picking his brain."112 Goddard left Wilmington, turning instead to the Guggenheims for support.This loss due to crude greed was perhaps the only economic opportunity missed by the Du Ponts during the presidency of Lammot du Pont. Stern and somber Lammot had succeeded to Irénée's position in 1926, when the company's structural reorganization had been completed to meet its expansion into new fields of chemicals, following Pierre's formula of management-decentralization/financial-centralization.

Phillips Petroleum was another Du Pont interest in the arms race of the Forties,Fifties, and Sixties. Since Phillips' founding in 1917, ***Eugene E. du Pont*** *was guardian of the family's stock holding in this sphere, 25 and personally served on the board of directors until 1954. During his postwar tenure, Phillips was extremely aggressive,increasing its assets from $332 million to $1.3 billion and its net income from $23million to $95 million. Phillips was attracted particularly to new oil resources. In southeastern Alaska, for example, it secured an operating agreement on nearly one million acres of land. For $39 million, it acquired over 200,000 acres of offshore holdings.*

Phillips often joined with other Du Pont family interests in big deals. With Henry's North American Aviation, it formed Astrodyne, Inc., to develop solid fuels for missiles and space rockets. After the Rubber Act of 1948 ended government ownership of a number of synthetic rubber plants, Phillips joined Du Pont-owned U.S. Rubber (in which Henry B. was also a major personal stockholder) and other oil and rubber giants in buying up the government's general-purpose synthetic rubber and butyl industrial capacity. Eisenhower sold twenty-six plants for $285 million, which was above their net value, yet these plants yielded $166 million in profits from 1951 to 1955 alone. At the time of the sales, five dissenters on the Senate Banking and Currency Committee correctly but futilely argued that the government could have reaped more in operational profits in four to five years than the total amount of the sales.

Phillips had other legislative boons during the Fifties. As the largest seller of natural gas to interstate pipelines, it was the sole supplier to the Michigan-Wisconsin Pipe Line Company. Since the war, helpless consumers found their gas rates climbing higher and higher. State officials and the pipeline company stood helpless as Phillips claimed its need for a 12 percent profit. When the Federal Power Commission refused to regulate the rates in 1951, the Wisconsin Public Service Commission went to court, while a Phillips official warned that if the case persisted "the people of Wisconsin could freeze... they would never get another cubic foot of natural gas."

The Wisconsin PSC won its case before the Supreme Court, which ordered the FPC to review and regulate Phillips's rates. But the FPC's Eisenhower appointees, while publicizing their opposition to Phillips, moved slowly in implementing the court's decision. Then, in 1955, the Harris-Fulbright bill freed gas producers from public regulation. A 5- to 10-cent increase per 1,000 cubic feet quickly ensued, producing again for the industry of up to $3 billion a year. As the second largest holder of gas reserves in the United States, Phillips got the lion's share.

These and other defense contracts to Remington Arms and U.S. Rubber comprised the bulk of the Du Pont family's profits from the Cold War during the Fifties.

*For Du Pont Company itself, the most direct sustained contact with the arms race was its work in developing the most terrifying weapon on earth—****the hydrogen bomb****.*

In August 1950 a very lean, relaxed Crawford Greenewalt appeared before the Congressional Joint Committee on Atomic Energy. By the end of the day he walked outwith an Atomic Energy Commission contract to develop the hydrogen bomb and operate its plant production. Although Crawford boasted to the press of Du Pont's agreeing to a$1 a year fee, he did not bother to mention that two other companies, G.E. and Sandria Corporation, had done likewise. Nor did he mention that Du Pont was to be one of four big contractors who would together receive an AEC "compensation" of over $2.5 billion yearly.

For the Du Ponts, it was a symbolic contribution to their celebration of the 150th anniversary of their landing on the lucrative American shore.

The Vanderbilts, it is often pointed out, survive as rich people; the Du Ponts surviveas a corporation. This may be changing now, but there is little doubt that the survival ofthe Du Pont family as a cohesive body with a separate identity of its own has been theresult of the unique role it played in American economic history as a company. It shouldbe emphasized, however, that the company has not ruled the family, as is so commonlysuggested; rather, the family has ruled the company. Throughout its history, the mainconcern of the family has always been the family, not the company. In fact, the mainconcern of Du Pont Company was always the Du Pont family. The family was never asobsessed with the company as it has been with itself. The family was the object of itsown determination and, in the early years, sweat. The company was merely a tool, andonce, in 1902, when the company was nearly given up, it was retained only in thefamily's interest. And now, as we shall see, control may well be surrendered, again inthe family's interest. The Du Pont family's profit, it is clear, is its own motivation. On this, Delaware's largest clan has built—and torn down—its greatest customs.

Du Pont history, however, did not occur in a vacuum, divorced from the broadersocial and economic history in which it thrived. Probably the strongest force aiding DuPont's rise was the State (polis).

In 1930 the former U.S. ambassador to Germany, James W. Gerard, named fifty-nine people who ruled America. Significantly, the ambassador omitted President Hoover andall federal and state officials. The real nature of the state, he explained, was "the power behind the throne," the men of industry and finance who had little time to spare to hold apolitical office, but, because of their economic positions, held permanent influence, not the temporary influence of an officeholder. Among those fifty-nine, Gerard named six Du Ponts: Pierre du Pont, Irénée du Pont, Lammot du Pont, Henry F. du Pont, Eugene duPont, Jr., and ***Eugene E. du Pont****.*

Gerard's revelations were not news along the Brandywine. Since E. I. du Pont hadfirst built his gunpowder mill on the banks of that creek, the power of government wasthe keystone of the company's growth. Du Pont's first sale was to the U.S. government,and the 1812 War, the Mexican War, and the Civil War were all timely boosts to DuPont expansion. The Du Ponts had always used political power to protect and furthertheir interests, but for the first ninety years confined this activity, for the most part, to theimmediate area of their economic concern, Delaware.

The organizational problems of the Powder Trust of Henry du Pont (who had literallyconquered Delaware during the Civil War with a Union army) required the direct use ofstate power, and Henry's successor, Eugene du Pont, even had Delaware's constitutionchanged to legally facilitate Du Pont's adjustment to the more efficient form of businessorganization, the corporation. From then on, the Du Ponts fully exploited Delaware'slenient tax laws, often being given direct assistance from local judges.

William du Pont's heirs, for example, saved millions in inheritance taxes in the earlyThirties when Wilmington's federal court ruled that their father's will, made just twoyears before his death at the age of 73, was not made "in contemplation of death."

Alfred I. du Pont, by incorporating his palatial Nemours mansion at $1 million, savedthrough "losses," taxes of $200,000 from 1931 to 1935 alone.

Mrs. Wilhelmina du Pont Ross also incorporated her stables and farms, saving$172,469 in taxes.

Pierre du Pont, Francis V. du Pont, Richard C. du Pont, Paulina du Pont, and Mrs. H.Ethel du Pont all gained large tax savings through personal holding companies.

Most of Lammot du Pont's $75 million estate went to the safe abode of familyfoundations and trusts for his widow and ten children.

Pierre du Pont's $80 million estate was left to his Longwood Foundation, to beadministered by Du Pont relatives in keeping up his flowered dreamworld. The settlement for taxes on this estate carries its own story.

Pierre's Longwood estate, where he had spent weekends and vacations since WorldWar I, was in Pennsylvania. Naturally Harrisburg tried to collect a Pennsylvania residency tax. This, however, would have raised the estate's total tax from $3.8 millionunder Pierre's Delaware citizenship (Delaware itself only asked for $600,000) to between $28 and $41 million. The Du Ponts fought this, insisting Pierre was aDelaware citizen exempt from Pennsylvania's claims. Finally, the state's tax authoritiestook the Du Ponts to the local court in Chester County and got a favorable ruling fromJudge Ernest Harvey in the second week of July 1955. Pennsylvania had the right, thejudge decided, to appeal the granting of ancillary letters of administration in ChesterCounty under which the state could collect on Pierre's property in Pennsylvania. Oneweek later, on July 25, the judge suddenly reversed his decision and said thatPennsylvania had no such right. This, he explained, would give the estate the right toappeal if anything went wrong in the case, "such a close one." Nothing did. Pierre'smoney stayed in the family.

There are other, similar cases. In 1957 the U.S. Internal Revenue Service claimed thatsome Du Ponts owed $452,207 in back taxes. The government settled for $158,908. Theclaims involved Marianna du Pont and her husband Henry H. Silliman, for $70,680,settled for $11,926; Octavia du Pont and her husband, J. Bruce Bredin for $195,585,settled for $98,291; Lammot du Pont Copeland and his wife Pamela for $156,642,settled for $30,953; and the Nemours Corporation for $29,300, settled for $17,738.

In 1962 the Treasury Department's original attempt to collect ordinary income tax onthe family's sale of some of its G.M. stock was foiled by lobbyist Clark' Clifford's andCrawford Greenewalt's visits to more than sixty Congressional and government offices,including those of Treasury Secretary Dillon and Attorney General Robert Kennedy.That year, in the instance already cited, a special bill saved the Du Ponts $100 millionin taxes, and in 1964 a reversal of a Treasury ruling saved them another $2 billion.

YACHT RACING PRIZES GIVEN

Skippers In Cedar Point Event Toast Craft At Gibson Island Club

Relaxing after the 100-mile cruising race to Cedar Point and back, skippers and crews of two dozen sailing craft toasted their boats last night at a banquet in the Gibson Island Club while prizes were awarded.

"Post mortems" of how one boat got jammed into the lee of the Eastern Shore, of how another crew sat becalmed and watched the rest of the fleet sail by were held, but soon were forgotten in the pleasures of the banquet board.

Plenty To Talk About

Prizes were not awarded on what might have happened. Skippers who shoved their boats first across the finish line off Baltimore Light got the awards. At that, there was plenty of excuse for talk, as no less than a half-dozen boats were in sight when the first one finished. And that, after a hundred miles of stick and rag, is something.

The boats set sail from Gibson Island Saturday morning and about 6.15 P. M. yesterday Mrs. D. C. Elphinstone's Rangoon, an eight-meter racing sloop, crossed the line first to win the Whiting trophy.

The Whiting trophy is awarded to the first boat to finish, regardless of class or time allowance. Mrs. Elphinstone sailed her own boat.

R. S. Mueller Wins Prize

The trophy in the racing division went to Robert S. Mueller, who put his Quest across the line in a good sailing breeze, which he had managed to carry most of the way.

The L. Corrin Strong cruising cup was won by Eugene E. du Pont, of Wilmington, Del., who brought his High Tide across the finish line a scant ten minutes ahead of J. Leo Flanigan's Gleam, which apparently had victory on its clean-swept decks only to watch, first place fade away when it ran into a calm within sight of the finish line.

However, the cruising division was divided into classes A and B. While the High Tide won Class A, the winner of Class B was the Sea Witch, owned and sailed by Donald H. Sherwood.

Bobby Miller Wins Trophy

As the long-distance racers were preparing for the evening's ceremonies the star boats went out to Baltimore Light and had a race of their own for the Symington Memorial trophy.

Ten stars slithered over a six-mile windward and leeward course in a close contest which was won by Bobby Miller in his Kingfish. After being in the ruck at the start, Miller took advantage of every slant of wind to nose out his brother, Berkeley T. R. (Bucky) Miller, who finished second in the Sole.

Others In Race

Others in the first division of the stars were Marjorie Hugson, in the Grayling, third; Aubrey Pearre, Jr., in the Bluefish, fourth, and Edmund Novak, in the Shark, fifth.

Others who were well up in the Cedar Point race were: Richard H. Randall, in the Loke, who finished third in the racing division; Theodore J. Hoster, in the Salabar, second in Class B of the cruising division; W. L. Henderson, in the Kelpie, third in the same class, and L. M. Balliere, in the Aweigh, third in Class A, behind the High Tide and the Gleam.

Eugene du Pont, leader in firm's expansion, dies

Eugene E. du Pont, 84, a great-grandson of the founder of the Du Pont Co., died Saturday at "Dogwood," his home in Greenville, after a long illness.

Services will be this afternoon at 2 in Christ (Episocpal) Church Christiana Hundred, Greenville. The family requests flowers be omitted.

Mr. du Pont was a member of the board of directors of the Du Pont Co. for more than half a century and was an important figure in the company's contributions to national defense in two world wars.

Eugene E. du Pont

He resigned as a director of the company in February 1965, after serving since 1906, first on the board of the Du Pont Powder Co., and then on the board of the present company following the reorganization in 1915.

HIS years with the company, starting in 1903 in the sales department, spanned Du Pont's growth from explosives production, which had been the sole activity for the first 100 years, through the program of diversification which made it the world's largest chemical company.

A resolution adopted by the Du Pont board when Mr. du Pont resigned in 1965 read:

"Mr. du Pont has exerted a strong influence on the growth of the company and his guidance has been an important factor in its present success. He was continuously active in the period of greatest diversification.

"His knowledge and interest in the field of explosives was very helpful to the company's contributions to the national defense efforts of two world wars. His support in connection with the expansion into the automotive industry facilitated the success of that venture. His personal interest and research in the associated field of petroleum chemicals provided a strong influence for growth. His intense interest and advice was instrumental in the acquisition of the Remington Arms Co."

MR. du Pont served as a director of Phillips Petroleum Co. from 1917 to 1955. For many years he also was a vice president and a director of the Delaware Motor Sales Co.

Mr. du Pont was born in Louisville, Ky., on Aug. 27, 1882, the son of Dr. Alexis Irenee and Elizabeth Bradford du Pont. He was graduated from Harvard University in 1903 with a bachelor of arts degree.

A life-long sportsman and game conservationist, he was a member of the Wilmington Club, Wilmington Country Club, Du Pont Country Club, Greenville Country Club. Aurora Gun Club, Vicmead Hunt Club, Corinthian Yacht Club, the Harvard Club of Delaware and the Bankers Club of New York.

Mr. du Pont's wife, who before their marriage in 1908 was Miss Katedulwe Moxham, died in 1931. He is survived by four daughters, Mrs. George T. Weymouth, Mrs. C. Porter Schutt, Mrs. W. Sam Carpenter III and Mrs. William Glasgow Reynolds, all of Greenville, and 14 grandchildren.

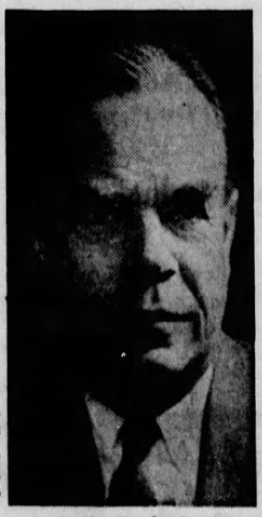
Remains on Du Pont Board

Emile F. du Pont Retiring Friday

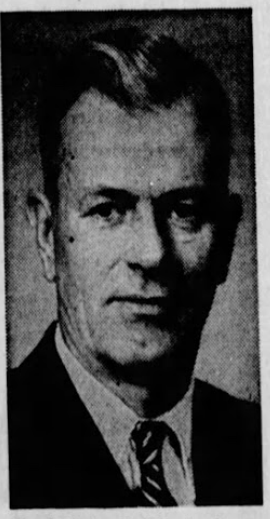
Emile F. du Pont, director of the Du Pont Co.'s employe relations department, retires Friday, but will continue as a member of the company's board of directors and finance committee.

Frederic A. C. Wardenburg, now director of the traffic department, will succeed Du Pont as director of the employe relations department.

A great-great grandson of the founder of the company, Du Pont's career has spanned 40 years of the firm's growth, including many years in production work. As head of the employe relations department, he has directed the activities relating to personnel, training, industrial relations, medical care, and safety and fire protection.



Emile F. du Pont



Frederic A. C. Wardenburg

Safety among employes has been one of his major concerns and he has seen the company's already-low injury rate cut in half during the last 12 years.

He started his career in 1923 as a student operator at the Arlington, N.J., plastics plant. In subsequent years, Du Pont held supervisory positions in the Buffalo, N.Y., rayon plant, worked in cellophane production, and in 1934, came to Wilmington as assistant manager of the personnel division of the service department — a forerunner of the employe relations department.

In 1937, he became manager of the company's first nylon plant at Seaford. The plant was just getting into production. Four years later, Du Pont returned to Wilmington as director of production of the nylon division of the textile fibers department, and in 1944 was named assistant manager of the acetate division.

After rejoining the service department as director of employe relations, he became director of the new employe relations department in 1951. The department had been reorganized to free its management of duties not directly concerned with employe relations.

HE HAS BEEN a member of the board of directors since April 17, 1944, and a member of the finance committee since Aug. 21, 1944. He was appointed chairman of the board of benefits and pensions and a member of the committee on educational aid in 1951.

He is president of the board of trustees of the Eleutherian Mills-Hagley Foundation, a director and former chairman of the board of the National Safety Council and a member of the board of trustees of the council, and a member of the board of directors of the Delaware Trust Co. He was a member of the board of directors of General Motors corp. from March 1955 to December 1959.

Du Pont, whose home is 2203 Grant Avenue, was born in Wilmington, May 20, 1898, the son of the late Francis Irenee and Marianna Rhett du Pont. He was educated at the Kent School, Kent, Conn., the United States Naval Academy, and Yale University.

Wardenburg, 58, started with the Du Pont Co. in 1928 as an engineer. After assignments at several plants for the engineering department, he was transferred to the comany's office in London in 1934. Upon his return to Wilmington in 1937, he was made head of the foreign exchange section of the treasurer's department and later became manager of the banking and foreign exchange section.

He was appointed assistant treasurer of Remington Arms Co., a Du Pont subsidiary, in 1942. In 1944 he was assigned to the company's atomic energy program undertaken for the government. He returned to London in 1945 as manager of the European office.

He came back to Wilmington in 1948 and became director of sales for the pigments department. In 1957 he was appointed director of the advertising department. He was named director of the traffic department in 1960.

Born May 19, 1905, in Denver, he is the son of Frederic A. Wardenburg, a director of the company. He was graduated from Princeton University with a bachelor of science degree in mechanical engineering in 1927. His home is 2601 W. 17th St.

Industrialist, Sportsman

Emile F. du Pont Dead at 76

Emile Francis du Pont, businessman, sportsman and conservationist, died yesterday at his home at 2203 Grant Ave. in Wilmington. He was 76.

Mr. du Pont resigned as a Du Pont Co. director because of failing health on April 8, 1974, after 30 years on the board.

His career in management and as a director spanned 51 years of Du Pont growth and diversification, including many years in production work. As head of the employe relations department, he directed activities relating to personnel, training, industrial relations, medical care and safety and fire protection.

Business associates knew Mr. du Pont as a serious, even stern man, with a propensity for asking penetrating questions. In private, he was an avid sportsman with a seemingly limitless array of interests.

Sailing, fishing and hunting were Mr. du Pont's hobbies, and he pursued them as assiduously as he did his work. In 1959 he pioneered a program of tagging and releasing salt-water game fish in the waters from the Carolinas to Maryland. One day that year, while bringing his new boat from Florida to Hatteras, N.C., he caught three blue marlin, a white marlin and a sailfish. He released them all, raising five red flags to indicate the catch. His action at first was viewed with skepticism, but by 1960 the tagging program was well under way.

Of the many marlin tagged by Mr. du Pont, four have been recaptured and released. One of these was caught the second time by Mr. du Pont himself.

As much at home in a duck blind or a canoe as he was at sea or in the office, Mr. du Pont was a sportsman with the eye of an artist. Painting was a lifelong hobby he pursued more intently in recent years, and many of his watercolors of fish and wildlife decorate the walls of his homes in Wilmington and in Bethany Beach.

He joined the company — founded by his great-great grandfather — in 1923 as a student operator at the Arlington, N.J., plastics plant. Mr. du Pont was transferred to the Buffalo, N.Y., rayon plant in 1925, becoming area supervisor of the cellophane plant there in 1930.

In 1931 he was appointed chief supervisor at the Spruance cellophane plant in Richmond, Va. He remained there until 1934 when he was transferred to Wilmington as assistant manager of the personnel division of the service department, predecessor of the present employe relations department. He became manager of the division a year later.

Mr. du Pont managed the company's first nylon plant in Seaford, a post he assumed in 1938. During his tenure there he, with his cousin, the late Henry B. du Pont, became a prime mover in making the company air-minded. A pilot since 1936, he built an airstrip and a hangar adjacent to the plant. During the construction period this permitted him to commute more frequently to and from Wilmington in his own Fairchild. The airstrip served as a prototype for many other Du Pont plants located in areas not served by commercial airlines.

After 3 years at Seaford, Mr. du Pont returned to Wilmington as director of production for the nylon division of the rayon department. In 1944 he became assistant manager of the acetate division in that department. He returned to the service department in 1945 as director of employe relations and became director of the department in 1951. Shortly afterward, the department was reorganized to free management from duties not directly connected with employe relations, and it was renamed the employe relations department.

Emile F. du Pont

Mr. du Pont was named to the board of directors on April 17, 1944, and served on the finance committee from Aug. 21, 1944 to April 16, 1973. He was chairman of the board of benefits and pensions from 1951 until 1964, and was a member of the committee on educational aid from 1951 until his retirement. In 1964, he was appointed a member of the bonus and salary committee (now the compensation committee).

Mr. du Pont's managerial skills also were in demand outside the company. He was a member of the National Safety Council's board of directors for 20 years, serving as chairman from 1952 to 1955. During these years he was an aggressive advocate of excellence in safety, both within Du Pont and on the council.

One of the projects in which he took great pride was the Eleutherian Mills Hagley Foundation. He served as president of its board of trustees from 1958 until his death. The foundation is most widely known for its Hagley Museum, which is dedicated to the interpretation of American business and technological history and is visited by thousands each year. The museum is located on the original company property along the banks of Brandywine Creek, very near where Mr. du Pont was born and reared.

Mr. du Pont was a senior member of the board of the Episcopal Church School Foundation, and served on the boards of the Delaware Trust Co. and the Du Kane Corp. of St. Charles, Ill. He was a member of the board of directors of General Motors from 1955 to 1959, and served on the board of trustees of Industrial Relations Councillors in New York City.

He was a member of the Wilmington Country Club, the Wilmington Vicmead Club and the St. Anthony Club of New York.

He was born in Wilmington May 20, 1898, the son of the late Francis Irenee and Marianna Rhett du Pont. He was educated at the Kent School, Kent, Conn., the U.S. Naval Academy and Yale University.

Mr. du Pont was married twice. His first marriage, to the former Sarah Townsend of Wilmington, ended in divorce. She died in 1968. In 1951, he married the former Margaret Dick Marvel, also of Wilmington. It was the second marriage for both. She died in 1972.

He is survived by three children by his first marriage, Francis Irenee of Wilmington, Sarah Townsend (Mrs. George F. Cahill, Jr.) of Needham, Mass., and Peter Rhett of New York City; three stepchildren, Jackson Marvel of Darien, Conn., Mrs. Richard P. Sanger of Wilmington and Mrs. Francis B. Adams Jr. of Baltimore; two brothers, Hubert L. and Edmond, both of Wilmington; three sisters, Mrs. Elise Elrick and Mrs. Taleasin Davies Jr. of Wilmington and Mrs. William Hanckle of Charleston, S.C.; and 24 grandchildren.

Funeral services will be Sunday at 2:30 p.m. in Christ Church (Episcopal), Christiana Hundred. Interment will be private.

[HN00MF][GDrive]

NY Times source : [HN00MH][GDrive]

Emile F. du Pont a member for many years of the board of E. I. du pont de Nemours & Co. and director of its employee relations department, died yesterday in Wilmington, Del. His age was 76.

Mr. du Pont served in the personnel post for 12 years before his retirement last April. His careers spanned four decades of the company's growth and included many years in production work.

He joined du Pont, which had teen founded by his great-great-grandfather, in 1923 as a student operator at the Arlington, N. J., plastics plant. In 1931, he was appointed chief supervisor at the Spruance Cellophane plant in Richmond.

Mr. du Pont was the first manager of the company's initial nylon plant in Seaford, Del., a post he assumed in 1938. With his cousin, the late Henry R. du Pont, he became a prime mover in making the company air-minded.

A private pilot since 1936, he built an airstrip and a hangar adjacent to, the plant. The airstrip served as a prototype for many other du Pont plants in areas not served by commercial airlines.

Mr. du Pont was named to the board of directors in 1944, and served on the finance committee from 1944 to 1973. He was chairman of the board of benefits and pensions from 1951 until 1964. He was a member of the committee on educational aid from 1951 until his retirement.

Surviving are 3 children of his first marriage to the former Sarah Townsend, Francis Irénée, Mrs. George F. Cahill Jr., and Peter Rhett; 3 stepchildren, Jackson Marvel, Mrs. Richard F. Sanger and Mrs. Francis B. Adam Jr.; 2 brothers, 3 sisters, and 15 grandchildren.

Mr. du Pont's second wife, the former Margaret Dick Marvel, died in 1972.

[HB001S][GDrive]

PAGE 386:

The demands of running such a gargantuan enterprise took its toll of older Du Pont executives during the war, making room for the next generation. In 1940 Lammot handed the presidency over to 52-year-old Walter S. Carpenter, Jr., head of the finance committee, and assumed Pierre's chairmanship. Two years later Charles Copeland and Francis B. Davis, Jr., resigned from the Du Pont board and were replaced by Charles's son, Lammot du Pont Copeland, destined for business tragedy, and Crawford Greenewalt, Irénée's son-in-law. In 1944, the same year Pierre left General Motors, A.Felix du Pont, Sr., was succeeded by Francis I. du Pont's second son, ***Emile [Francis du Pont]****, whose management fortunes had risen with nylon.*

PAGE 409:

Less covert was Du Pont's support of the new oil depreciation allowance. Besides Du Pont's own direct involvement with the oil industry through the production of synthetic rubber and its Ethyl Gasoline Corporation, the family had invested personal funds in Phillips Petroleum, Chanslor-Western Oil, Ardee Oil (in Texas and Montana),and Oil Associates (in Louisiana and Texas). By the 1960's, Lammot du PontCopeland's Delaware Fund would hold huge blocks of stock in Universal Oil, Standard Oil of New Jersey, Royal Dutch Petroleum, Occidental Petroleum, and Gulf Oil; E. I. duPont's New England Fund would be a large stockholder in Mobil and Texaco; and ***Emile F. du Pont's Blue Ridge Mutual Securities in Continental Oil, Atlantic Richfield, Cities Service, and Union Oil of California***

But probably the greatest incentive for Du Pont's production of the film "It Never Rains Oil" was its heavy investment in the automobile industry, particularly General Motors. Sponsored by the leading oil associations, Du Pont's film presented the case forthe depreciation allowance, a curious logic that argues that a business should be paid bythe taxpayer for selling its product on the market. According to the minutes of the National Petroleum Council in 1953, Deputy Petroleum Administrator Joseph La Fortune, on leave as vice-chairman of Gulf's Warren Oil Corporation, "furnished the information as to the money expended by Du Pont for having the film made in Hollywood, its fine possibility as education mediums for use in colleges, high schools,etc., availability and cost to those interested in showing the film.

PAGE 435:

With their G.M. diversification funds, many Du Ponts also invested in new firms utilizing the latest scientific technology, including computers, which worked on military contracts during the Vietnam era. William H. du Pont, the son of William du Pont, Jr., setup Sci-Tek, Inc., a computer-based operation which took in $15,000 in Navy contracts in 1971, $80,000 in 1972.79 ***Emile F. du Pont's Dukane Corporation*** *grossed $20,744 on one Navy contract in 1972 for developing a locater system in jet planes.80 Reynolds and Richard C. du Pont's All-American Engineering raked in $1.6 million in 1972, bringing its Vietnam era (1964–1972) total to $11 million.*

All told, the family's varied corporate interests grossed over 15 billion in war contracts between 1964, the year of the first arms buildup, and 1972. Of the top ten war contractors, three (North American Rockwell, Boeing, and General Motors) represented large investments of the Du Pont family. Of the top forty Pentagon contractors, eight(North American Rockwell, Boeing, General Motors, Newport News Shipbuilding, DuPont, Hercules, and Uniroyal), or one-fifth, were Du Pont interests. Du Pont Company alone reaped over $1 billion in war contracts. One Du Pont enthusiast recently became very flustered at the suggestion of war profiteering by his favorite family. "I challenge anyone to show proof of any money made off this tragic war!

PAGE 461:

All these ventures, as well as time itself, helped breach the rifts created in the family by Alfred I. du Pont's famous feud with Pierre S. du Pont. Edmond's father had sided with Alfred against Pierre's allies but soon after reached a truce and a $30 million investment by the family. Now, through Laird, Bissell, & Meeds, Edmond was rubbing shoulders with Garrett Van S. Copeland, older son of Du Pont President Lammot duPont Copeland, Henry Silliman, son-in-law of old Irénée du Pont, Edward New-bold Smith, son-in-law of Henry B. du Pont, and Alfred Bissell, who married the niece of Eugene du Pont, Jr. Through Laird Inc., Edmond was also in touch with George Weymouth, another in-law, Silliman, Smith, and Alfred du Pont Dent, grandson of Alfred I. du Pont.

Assisting along the way also was Edmond's brother ***Emile [Francis du Pont]****, whose sharp mind had propelled him to a vice-presidency and directorship in Du Pont Company.*

Emile [Francis du Pont] *was brought into the family's Blue Ridge Mutual Fund by Eleuthère du Pont, as was Edmond.There, Edmond also joined Donald F. Carpenter and James Q. du Pont in stock speculation, while* ***Emile [Francis du Pont]*** *in 1967 joined* ***Eleuthère and Reynolds du Pont in another fund, Sigma Capital Shares Corporation****. Eleuthère also made Edmond treasurer of his Delaware Chemical Engineering Corporation. These growing ties were also reflected in the Continental American Life Insurance Company, where Eleuthère, as treasurer, put Edmond's knowledge of mutual funds to profitable use. Edmond even served as a director of Continental American for a period with George P. Edmonds, son-in-law of Lammot du Pont, and Francis V. du Pont, son of T. Coleman du Pont. With this economic rise came the social laurels of a directorship in old Henry F. du Pont's Winterthur Corporation and, in 1965, trusteeship of the University of Delaware.*

PAGE 462:

In 1967 F. I. du Pont & Company was generating close to $100 million in income from its own operations, and had become a major stockholder in such corporate giants as A.T. & T. Other Du Ponts, led by Lammot du Pont Copeland and ***Emile F. du Pont****, bythen had invested heavily in F. I. du Pont & Company, and Garrett Van S. Copeland,Lammot's son, and Peter R. du Pont, Emile's son, had even become partners.*

PAGE 554:

In Delaware the Du Ponts have also given to Delaware Technical College. Sponsored by Du Pont Company, this college trains young Delawareans for white-collar jobs in the state's chemical industries, and also trains police for maintaining Du Pont order.Richard P. Sanger, son-in-law of ***Emile F. du Pont****, even serves as chairman of the Advisory Committee on Police Science. In many ways, Delaware Technical is merely a training ground for Du Pont, on a lower level than the University of Delaware. As then Du Pont president Lammot du Pont Copeland once put it in a speech at the university, "I am very sure that you, as a production organization, can turn out a product more perfectly adapted to the needs of the user if you know something about that customer and his needs. I suspect that the incentive to do so will be greater if your knowledge of the customer has led you to respect him and, perhaps, even to like him." Whereupon, Lammot supplied the information on Du Pont's needs; Du Pont money supplied the goodwill.*

PAGE 566:

This diversification of Du Pont family holdings means that majority blocks of stocks in companies are being replaced by minority blocks which are still large and important enough to exercise some measure of control over a company. Direct control is seldom needed if management is doing its job efficiently and turning out fat dividends. Rather than an Irénée du Pont exercising absolute domination, now the family fortune has been passed on to a number of heirs, even as the family's total wealth continues to grow. This splitting up of family stock blocks does not mean that capital no longer tends to accumulate. Just the opposite. It is the very tendency of capital toward accumulation in the form of mergers that is reducing the share held by each individual Du Pont in a company. ***Emile F. du Pont, for example, might well have held 15 percent of Symington-Wayne when he was a director of that company. When Symington-Wayne merged with Dresser Industries, his holding in the new company may have been reduced in half, to perhaps 7.5 percent****. But capital has accumulated; a bigger corporation has been born.These mergers, while reducing controlling stock blocks, actually increase, through the added assets and resource benefits of combination, the Du Pont family's wealth. Thus Du Pont wealth, and the power of their business class as a whole, is not diminishing, but growing.*

PAGE 572:

Mergers removed Du Ponts from the boards of three companies: ***Emile F. du Pont*** *from* ***Symington-Wayne (which merged with Dresser Industries)****, Anthony A. du Pont from Garret Corporation (merged into Signal Companies), Colgate Darden from Newport News Shipbuilding (merged into Tenneco), and A. Felix du Pont, Jr., from Piasecki Helicopter (which became Piasecki Aircraft). The Du Pont family's investment in North American Rockwell appears intact, despite their failure so far to replace Henry B. du Pont on the board after his death in 1970.*

PAGE 582:

Francis I. du Pont II. Son of Emile F. du Pont, he has joined E.I. du Pont's Sigma Investment Fund as a director.

[...]

Peter du Pont. The son of Emile F. du Pont, he is a director of Laird, Inc

PAGE 584:

Richard P. Sanger. Sanger was the executive editor of the News-Journal and directorof Delaware Trust. Predictably, he is also married to a Du Pont, Margaret Marvel,stepdaughter of Emile F. du Pont.

PAGE 592:

The first direction was away from the company that bears their name. Symptomatic of this was the growth of the family's mutual funds. Blue Ridge Mutual Fund, which had$52 million in assets in 1967, had its name changed to Sigma Investment Shares in 1969 by Eleuthère du Pont. Its assets in 1974 were about $72 million. The same held true for Sigma Venture Shares, which Eleuthère began in 1969. Worth $3 million in assets in1971, it had assets of $6.2 million in 1974.Involved in Eleuthère's group were James Q. du Pont, Donald F. Carpenter, ***Emile F. du Pont****, R.M. Layton, W.J. Kitchell, Reynolds du Pont, H.H. Sillman, and Francis I. duPont II.These were some of the common stocks owned by just one of Eleuthère's firms,Sigma Investment Shares:*

Ethel du Pont Roosevelt-Warren (January 30, 1916 – May 25, 1965) was an American heiress and socialite and a member of the prominent du Pont family. She is known for her widely publicized marriage to Franklin D. Roosevelt Jr., son of the 32nd President Franklin D. Roosevelt and Eleanor Roosevelt and her eventual suicide in 1965.[1]

Contents

- 1 Early life

- 3 References

Early life

Ethel du Pont was born on January 30, 1916 in Wilmington, Delaware, the eldest child of Eugene du Pont, Jr. and Ethel Pyle.[2] She was the granddaughter of Eugène du Pont (1840–1902), the first head of the modern DuPont corporation, who saw the corporation into the 20th century.[3] Her siblings were Aimee du Pont, Nicholas R. du Pont, and Eugene du Pont III.[2]

She was raised at Owl's Nest, the family's estate in Greenville, Delaware,[4] attended Misses Hebb's School in Wilmington and graduated from the Ethel Walker School in Simsbury, Connecticut.[2]

Personal life

On June 30, 1937, she married Franklin Delano Roosevelt, Jr. (1914–1988), third son of sitting President Franklin Delano Roosevelt, Sr. and First Lady Anna Eleanor Roosevelt,[5][4] and grand-nephew of President Theodore Roosevelt.[2] They had two sons:

- Franklin Delano Roosevelt III (born 1938)[6]
- Christopher du Pont Roosevelt (born 1941)[6]

The couple separated and formally divorced in 1949.[7] In December 1950, Ethel du Pont Roosevelt remarried to prominent Detroit lawyer, Benjamin S. Warren, Jr., a Yale College and University of Michigan Law School graduate. Together, they had a son:[8]

- Benjamin S. Warren III (born 1954)[9]

Death

Ethel du Pont was forty-nine years old when she committed suicide on May 25, 1965.[1] She had been under psychiatric care several times in the years preceding her death and spent time at the Silver Hill Foundation, a hospital in New Canaan, Connecticut.[1] Her death took place a few months before her son Christopher's wedding in June 1965 and while her son with Warren, then 10 years old, was away at boarding school. [1] Her family endowed the Harvard Medical School Ethel Dupont-Warren Fellowship Award for research in Psychiatry.[10]

Engagement of DuPont Heiress to President's Son Is Announced

ETHEL DU PONT

FRANKLIN D. ROOSEVELT, JR.

[HN010M][GDrive]

Franklin D. Roosevelt, Jr., Will Take Ethel DuPont as Bride in June Wedding

WILMINGTON, Del., Nov. 14—(AP)—Mr. and Mrs. Eugene Du Pont announced tonight the engagement of their daughter, Miss Ethel Du Pont, to Franklin D. Roosevelt, Jr., son of President and Mrs. Roosevelt. The wedding will take place the latter part of June.

Miss Du Pont is the eldest of the four children of Mr. and Mrs. Du Pont of Greenville, Del. Du Pont is a member of the board of the E. I. Du Pont de Nemours & Company. She is a niece of Lammot Du Pont, president of the company; Pierre S. Du Pont, chairman of the board, and Irene Du Pont, a member of the board.

After her early education at the Tower Hill school, Wilmington, Miss Du Pont attended the Ethel Walker school in Simsbury, Conn. Indications of her friendship with young Roosevelt became apparent in 1934 because of his frequent visits to the Walker school while a freshman at Harvard.

She Is Known as Beauty

Miss Du Pont, 21, blonde and of medium height, was selected by the artist, Don Flowers, as the most beautiful and most eligible of the wealthy "bachelor girls" in America. She is an ardent horsewoman and skillful swimmer, and at one time took instructions in flying. Last summer, with her parents and sister, she traveled in Europe.

The friendship between Miss Du Pont and Roosevelt received wide publicity in April, 1934, after he smashed the camera of a newspaper photographer who snapped them among the spectators at a wrestling show in Philadelphia.

Roosevelt attended Miss Du Pont's debut June 27, 1934, at a dinner dance at her home. Legal representatives of the family denied subsequent rumors they were engaged. The following December she was a guest at the White House at a week-end house party given by the President and Mrs. Roosevelt for their sons and friends.

Wooed by Airplane

Roosevelt's enthusiasm in his romance took him on an airplane trip down New York harbor in March, 1936, to meet a ship on which Miss Du Pont was returning from Bermuda, and to ride with her to the ship's pier. During the last year he has attended several social functions with her.

Young Roosevelt is a week-end guest at the Du Pont home.

The family's announcement included mention of his graduation from the Groton school and his membership in the Harvard class of 1937. It listed his clubs as the Fly, Iroquois and Hasty Pudding.

INFORMATION SHEET

RESEARCH, DEVELOPMENT OR DEMONSTRATION PROJECT

This sheet describes briefly a contract under Section 5 Federal Water Pollution Control Act, As Amended.

PROJECT NUMBER: 1509 HOE (Contract 68-01-0113)

TITLE OF PROJECT: "Field Detection and Damage Assessment Handbook"

CONTRACTOR:
Enviro Control, Inc.
1250 Connecticut Avenue,N.W.
Washington, D. C. 20036

PROJECT DIRECTOR
Dr. D. M. MacArthur
Enviro Control, Inc.
1250 Connecticut Avenue, N. W.
Washington, D. C. 20036

Project Site: Washington, D. C.

SPECIFIC DATA ABOUT THIS AWARD

Award Date: 6/21/71

Project Cost: $56,297.00

Completion Date: 2/8/72

Federal Cost: $56,297.00

DESCRIPTION OF PROJECT

This project is designed to produce a handbook of procedures and techniques which are technically and legally defensible for assessing damages to the aquatic environment resulting from discharges of oil and hazardous materials. The handbook will serve as a model for developing State response and contingency planning programs. Standardized observations, testing and reporting will result from State and local programs adopting similar damage assessment techniques.

PROJECT OFFICER

Dr. C. H. Thompson, Chief
Hazardous Material Spills
Division of Oil & Hazardous Materials
Washington, D. C. 20460

FOREWORD

On September 21, 1981, a visit was made to the Tosco Corporation Rocky Flats Research Center 1ocated·near Golden, Colorado. The purpose of the visit was to .discuss the applicable technology for controlling worker exposure to potentially hazardous chemical and physical agents associated with the TOSCOACLo al Pyrolysis Process. The meeting was attended by the following persons:

- Tosco Corpora ion
- Robert Hall, Vice President, Resources, Golden
- Merril Coomes, Manager, Environmental Health, Los Angeles
- Jerry Chiaramonte, Managing Engineer, Golden
- John Staton, Managing Engineer, Golden
- Michael Brisco, Chemical Engineer, Golden
- Raj Sharma, Chemical Engineer, Golden
- Gerald Faudel, Environmental Control Analyst, Golden
- DynamacC orporation
- Donato Telesca, Program Manager
- Jan Scopel, Chemical Engineer
- Russell Tanita, Industrial Hygienist

Info on "Donato R. Telesca" -

https://www.reedfuneralhome.com/obituary/Donato-R.-Telesca/Canton-OH/125024

October 12, 1918 - May 4, 2004

Born in Dunmore, PA

Resided in Canton, O

Donato R. Telesca, age 85, a longtime resident of Towson, Maryland and more recently of Canton, passed away Tuesday morning at the Canton Regency following a courageous battle with cancer and Parkinson's Disease. He joins his beloved wife, Ruby Telesca (Dancy) of 53 years, who preceded him to be with the Lord. He was born on Oct. 12, 1918 in Dunmore, PA and was graduated in 1936 from Dunmore High School. He received his degree in chemical engineering from Massachusetts Institute of Technology in 1948. His education was interrupted when he was called to duty during World War II and served with the Army Infantry Division. **In 1954, he received a degree in Business Administraton from Rutgers University. He was employed by the W.R. Grace Company until 1973 and then by Enviro Control until his retirement.** Don was always greatly admired and loved by his family. He is survived by his daughter and son-in-law, Donna and Dr. Alexis Sayoc of North Canton; son and daughter-in-law, Robert and Jamie Telesca of Las Vegas, NV; **grandchildren, Lisa Sayoc M.D., Jeffrey and Irene Sayoc, Suzanne Sayoc,** Bonnie and Keith Combs, Robyn Layfield and Jessica Telesca. He was a great-grandfather to Justin and Alex Cambs, Andre Breanna, Grant Sayoc, Haley Layfield and David Bonham. He was the eldest of five children of Joseph and Bernetta Telesca who preceded him. He leaves a brother, Francis Telesca of Miami, FL and sisters, Carmela Fazio of California, Vita Heineman of Rockville, MD and Helen Hamilton of Prescott, AZ. Funeral services will be conducted at 8 p.m. Thursday in the Reed Funeral Home with Rev. Fr. Joseph Zamary officiating. Visitation will be from 6p.m. to the time of services. An additional visitation will be Friday evening at the Ruck Funeral Home (410-426-1517), Baltimore, MD. Burial will be Saturday morning at Delaney Cemetery, Cockeyeville, MD.

Wedding

The wedding of **Sally Kissinger** and **Robert F. Fetterman** was Nov. 20 at Bethany Evangelical Lutheran Church, Reading.

The bride is the daughter of Mr. and Mrs. Charles A. Kissinger of Reading. She is a graduate of Mount Penn High School, Reading, and Bloomsburg State College. She is employed as a speech pathologist at Therapy Inc., Lexington Park, Md.

The groom is the son of Mr. and Mrs. Robert E. Fetterman of Flourtown. He is a graduate of Springfield High School and Bloomsburg State College. He is a computer specialist for Dynamac Corp., Lexington Park, Md.

The matron of honor was Karen A. Nicholas, sister of the bride. Attendants were Amy O'Neill, a cousin of the bride, and Cynthia Ziegler, Adrienne Cardinal and Virginia Bleecher, friends of the bride.

The best man was James G. Fetterman, brother of the groom. Ushers were Donald Engle, Matthew Miller, Craig Holmes and Edward Kelly, friends of the groom.

The couple is living in Hollywood, Md.

ENVIRONMENTAL PROTECTION AGENCY

[TSH-FRL 2287-5; OPTS-140005]

Captial Systems Group and Dynamac, Inc., Transfer of Data to Contractor

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: EPA will transfer to its contractor and subcontractor information submitted by manufacturers, processors, and importers of chemical substances recommended for consideration by the Interagency Testing Committee under section 4 of the Toxic Substances Control Act (TSCA). Some of this information may be claimed to be confidential. Capital Systems Group (CSG) of Kensington, Maryland, and its subcontractor, Dynamac, Incorporated, of Rockville, Maryland, will review and analyze this information for the purpose of developing technical support documents concerned with environmental and health effects of these chemical substances and to identify exposure situations.

DATE: The transfer of data submitted to EPA and claimed to be confidential will occur no sooner than 10 working days after publication of this notice in the Federal Register.

FOR FURTHER INFORMATION CONTACT: Chris C. Tirpak, Acting Director, Industry Assistance Office (TS-799), Office of Toxic Substances, Environmental Protection Agency, Rm. E-511, 401 M St. SW., Washington, D.C. 20460, Toll free: (800-424-9065). In Washington, D.C.: (202-554-1404). Outside the USA: (Operator-202-544-1404).

SUPPLEMENTARY INFORMATION: Under section 4 of the Toxic Substances Control Act (TSCA), 15 U.S.C. 2603, EPA is authorized to promulgate regulations requiring testing of chemical substances and mixtures in order to develop data relevant to determining the risks that such chemicals may present to health or the environment. To accomplish this, EPA will need to use production data and exposure information submitted by manufacturers, processors, and importers of chemical substances recommended for consideration by the Interagency Testing Committee under section 4. Some of these submissions may be claimed confidential. EPA has selected Capital Systems Group of Kensington, Maryland, and its subcontractor, Dynamac, Inc., of Rockville, Maryland, to provide outside assistance in performing analyses of these submissions for EPA's use in its evaluation of these chemical substances (Contract No. 68-01-6530). CSG and Dynamac, Inc., will review and analyze the information for the purpose of developing technical support documents concerned with environmental and health effects of the substances and to identify possible exposure situations and determine the magnitude of such exposure.

Pursuant to 40 CFR 2.306(j), EPA has determined that it will need to disclose confidential business information to CSG and its subcontractor, Dynamac, inc. EPA is publishing this notice to inform TSCA submitters that CSG and Dynamac, Inc., will have access to confidential business information from EPA.

Captial Systems Group and Dynamac, Inc., are legally required under the terms of their contract and subcontract to safeguard the confidential business information they receive from any unauthorized disclosure. Any reports they prepare using this information will also be treated as confidential. All confidential business information will be returned to EPA when CSG and Dynamac, Inc., have completed their work.

Under the EPA manual "Contractor Requirements for the Control and Security of TSCA Confidential Business Information," CSG and Dynamac, Inc., have been authorized to have access to this information. EPA has approved CSG's security plan and has conducted the required inspection of the CSG facilities and found them to be in compliance with the provisions of the manual. No confidential business information will be transferred to Dynamac, Inc.'s, facilities under this contract and subcontract.

CSG and Dynamac, Inc., are required to treat all confidential business information in accordance with the requirements of the "TSCA Confidential Business Information Security Manual" and the Contractor Requirements manual. Their personnel will be required to sign a nondisclosure agreement before they are permitted access to such information.

Dated: December 27, 1982.

Don R. Clay,

Director, Office of Toxic Substances.

Final Agency Action on a PSD Permit for Endevco, Inc.

Notice is hereby given that on July 6, 1982, Region 6 of the Environmental Protection Agency (EPA) issued a Prevention of Significant Deterioration (PSD) permit, Number PSD-AR-386, to Endevco, Incorporated for approval to modify its existing natural gas sweetening plant located 8 miles northeast of Fouke, Miller County, Arkansas, pursuant to 40 CFR 52.21. On July 23 and August 5, 1982, Mr. John A. Buckley, Jr., Attorney at Law, petitioned the Administrator on behalf of several landowners and residents in the vicinity of the plant for review of the PSD permit.

Because a petition for review was filed with the Administrator, the issuance of the permit was no longer a final agency action and the PSD permit for Endevco was not effective. *See* 40 CFR 124.15(b)(2). The petition for review was denied by the Administrator on October 22, 1982. Pursuant to 40 CFR 124.19(f)(1), a final permit decision on PSD-AR-386 was issued by Region 6 on November 23, 1982.

Under Section 307(b)(1) of the Clean Air Act, judicial review of PSD-AR-386 is available only by the filing of a petition for review in the United States Court of Appeals for the Eighth Circuit within 60 days of today. Under Section 307(b)(2) of the Clean Air Act, the requirements which are the subject of today's notice may not be challenged later in civil or criminal proceedings brought by EPA to enforce these requirements.

Copies of all of the materials concerning PSD-AR-386 are available for public inspection upon request at the following location: Environmental Protection Agency, Region 6, Air and Waste Management Division, Air Branch, First International Building, 1201 Elm Street, Dallas, Texas 75270.

Frances E. Phillips,

Acting Regional Administrator, Region 6.

January 6, 1983.

Businesses Eligible For Free Evaluation

Employers in Pittsburgh and Western Pennsylvania should take advantage of a free on-site job safety and health consultation service, suggests Stanley Elliott, area director in Pittsburgh for the U.S. Labor Department's Occupational Safety and Health Administration (OSHA).

Elliott says that employers interested in obtaining advice on workplace hazards may contact the Dynamac Corporation's Enviro Control Division by dialing toll free 1-800-382-1241. Dynamac is the contractor carrying out consultations in Pennsylvania.

"There are several benefits for employers who use this no-cost expert assistance," Elliott explains.

Number one, they can find and correct problems in their workplaces before hazards result in accidents.

Two, there are no penalties in the consultation program. It is completely separate from OSHA's enforcement activity.

Three, the program gives priority to small companies in high-hazard industries. This is a help to small firms without the resources to have safety and health professionals on their payrolls.

Finally, the employer can request advice on either an entire plant or on specific operations. The consultant will suggest general approaches or options for solving safety and health problems and identify kinds of help available.

The Enviro Control Division of Dynamac Corp., Rockville, Md., has been awarded a one-year, $213,000 contract by OSHA to provide free consultation services in Pennsylvania and New Hampshire.

During fiscal year 1983, some 300 employers in the two states are expected to participate in the consultation program.

Before the consultant visits their worksite, employers who seek a consultation commit themselves to correct any serious job and health hazards that may be found. In rare instances, when employers fail to follow through on this commitment, the consultant is obliged to report uncorrected hazards to OSHA.

Businesses may also contact the consultants by writing to Dynamac Corp., P.O. Box 1862, Harrisburg, Pa. 17105.

Multi-agency workshop on Klamath slated

By RONNIE M. PIERCE
Times-Standard
correspondent

EUREKA — This week in an intensive five-day workshop, representatives of 11 state and federal agencies grappled over the language of a preliminary draft status evaluation report on the anadromous fishery resources of the Klamath basin.

CH 2 M Hill — a private consulting firm contracted by the Bureau of Indian Affairs for $500,000 to develop a "Klamath River Basin Fisheries Resource Plan" — called the agencies together for review and comment on the first draft report of the project.

The preliminary evaluation report under discussion provides "a historical perspective for anadromous fish management efforts, population strengths, habitat availability, and hatchery programs." Dynamac, a Denver firm working on a sub-contract to CH 2 M Hill, spent several months on a literature search of published and unpublished documents about the Klamath River system.

"This material is to be the data base for the final resource plan and recommendation, so we have to make sure that all the data is updated and correct," Jean Edwards, BIA project manager of the plan preparation, said. "We recognize that it would take a great deal of time, so we scheduled the whole week. Basically, we're going through it page by page."

Paul Hubell, a research supervisor for the California Department of Fish and Game, said the BIA is striving to get a document that people will endorse and accept. "This is the way to do it," he said. "It's essential to get input from all the involved agencies at the ground-floor level."

Zeke Grader, of the Pacific Coast Federation of Fishermen's Associations, spoke for commercial salmon trollers and expressed concern about a lack of user-group representation on the review committee. "Without the user group input and expertise you (CH 2 M Hill) will have a real credibility problem," Grader said.

John Bushman, special assistant to the director of BIA's Office of Trust Responsibilities in Washington, also attended Wednesday's meeting. He agreed that the user-group involvement would enhance the review process and opened a seat on the committee for a PCFFA representative. Bushman also said he would look into getting a technical representative from the sport fishing community.

"I think if we all work cooperatively we can get things done that are necessary to protect and enhance the resource," Bushman said. "We've got to find a way to resolve some of these conflicts."

After this week's comments and corrections have been incorporated into the first portion of the plan, it will be redistributed to agencies and made available for public comment. The rewrite will take one to two months. Work will then begin on the next phase of the project, a draft "Action Plan" which will focus on specific recommendations for actions and programs to rebuild the Klamath system fisheries resources.

A series of public hearings on that draft action plan is tentatively scheduled for March, 1984.

Retiring Eielson colonel knew military his destiny

LEONIE VINK
Correspondent

EIELSON AIR FORCE BASE—Col. Miroslav F. Blazek, deputy commander for maintenance for the 343rd Tactical Fighter Wing, has traveled a long road from Czechoslovakia to Eielson Air Force Base.

Blazek, the senior ranking colonel at Eielson who is retiring soon after 25 years in the Air Force, was born in Prague in 1938 and escaped from behind the Iron Curtain in 1949 following the communist takeover of his country.

"My family was one of the oldest families in the country, descendants from the Hapsburg empire," said Blazek. "Over the years my family on both my father's and my mother's side had built up a great fortune and founded corporations. Thus we were a great target when the communist regime took over."

His father was arrested and put in jail several times. "One day, my mother had papers forged to get dad out of jail for a period of 24 hours. They escaped, but my sister and me, then 11 and 9 years old, had to stay behind."

It was not until two years later that they escaped as well.

As a refugee, Blazek traveled in Germany, France, and Africa. He was reunited with his family and after five long years of waiting, they were permitted to emigrate to the United States in 1955. The Blazeks settled in Elizabeth, N. J. and young Blazek graduated there from Thomas Jefferson High School.

Blazek received a graduate degree in aeronautical engineering and joined the Air Force through the Air Force Reserve Officer's Training Corps

COL. MIROSLAV F. BLAZEK

program at Texas A & M University in August 1960.

"I went to that particular university because it was the only place that would admit people who did not have American citizenship. I picked a military career for a number of reasons. First of all, when I was born, an uncle stood over my cradle and predicted that I would become a soldier. He was killed in a concentration camp and it was important to me, although I can hardly remember him, to indeed become part of a military organization."

Blazek said he always wanted to fly and he also wanted to be like his father, who was an engineer. "On the other hand I did not really want to give up playing tennis as a professional and, since my mother was a concert pianist, also wanted to major in music. But I settled for the military career and engineering. It was a good way to return some of my gratitude to the country that had welcomed us with open arms."

By-passing maintenance officers school, he was assigned to the 4510th Combat Crew Training Wing at Luke Air Force Base in Arizona. He was also stationed in the Philippines, Virginia, Vietnam, Japan, Hawaii, Florida and Ohio.

Blazek received a graduate degree in systems management from the University of Southern California in 1975 and did postgraduate work in microengineering with the Massachusetts Institute of Technology in 1980. He graduated from the Air War College in 1982.

Blazek's military decorations include the Bronze Star, Meritorious Service Medal (four times), Air Force Commendation Medal (four times), Combat Readiness Medal, Vietnam Service Medal with five campaign stars, Humanitarian Service Medal, Republic of Vietnam Gallantry Cross with palm.

After his retirement, Blazek plans to work for the Dynamac Corporation, setting up a new office for the company's defense systems branch in Dayton, Ohio.

Although he is looking forward to starting a new career, Blazek thinks he might have stayed in the military under different circumstances. "I am constantly amazed how the system takes care of our own military people. I would have elected not to retire if they had indicated that they needed me. The Air Force has the idea that the higher you get in the ranking system, the less support you need from the leaders. There could not be a greater fault than in thinking that."

ENVIRONMENTAL SCIENTIST

"AFRICA"

Dynamac International, Inc. is headquartered in Rockville, Md. and provides scientific, engineering and environmental research services to both government and industry. Dynamac has employment opportunities for individuals who are trained and experienced in the following areas:

- PhD in ecology or environmental science with some post doctoral experience
- BS or MS in the biological sciences and 2-3 yrs. related exp. Experience in the preparation of Environmental Impact Statements is considered a plus

The successful applicants for these positions will be required to spend 3 to 4 months in East, West, or South Africa, where they will be involved in examining the environmental impact of the application of field pesticides.

Dynamac offers competitive salaries and a fully paid employee benefits pkg. To apply, please send resume in confidence to:

Foes of germ lab question study

WASHINGTON (AP) — A public interest group fighting construction of a germ warfare laboratory in Utah has raised questions about the objectivity of the consulting firm that helped the Army prepare an environmental impact statement for the project.

The group, the Foundation on Economic Trends, says it simply wants to satisfy itself there was no bias favoring the Army because the consulting firm's president once worked as a top Pentagon official with responsibilities in the chemical and biological warfare arena.

The impact study prepared by Dynamac, a consulting firm based in Rockville, Md., concluded the Army can build and operate a "high-containment" lab at Dugway Proving Ground in Utah to experiment with germ-warfare defenses without posing an environmental threat.

Dynamac's president, Dr. Donald M. MacArthur, said he left government service in 1970 and in any event, played no role in handling the study prepared for the Army by his company.

But Jeremy Rifkin, president of the foundation, said Wednesday: "We think it's a problem in terms of conflict of interest. Twenty years ago, Dr. MacArthur wanted to pursue this work.

"Now his company is saying construction of the lab should proceed. We have questions — no conclusions yet — and that's why we're asking Defense Secretary (Frank C.) Carlucci to intervene."

The Foundation on Economic Trends, a Washington-based environmental activist group, has opposed the Army's plans from the very start.

Opponents question study on proposed warfare lab

By JOAN LOWY
Scripps Howard News Service

WASHINGTON — Opponents of an Army plan to build a new laboratory in Utah capable of testing against biological warfare agents that have no cure Tuesday attacked the objectivity of an environmental study of the project.

Jeremy Rifkin, head of a watchdog group on biotechnology and genetic engineering, told a joint hearing of three House committees that a draft environmental study of the plan proposed for the Dugway Proving Ground, prepared for the Army by a private corporation, is "suspect."

Mr. Rifkin questioned the report because the president of the company is a former Defense Department official who has advocated the testing of genetically-engineered biological warfare agents.

The environmental study was prepared by Dynamac Corp. of Rockville, Md. Dynamac's president is Donald MacArthur, a former deputy director of research and technology for the Pentagon.

In 1969, Mr. MacArthur told Congress the potential to "produce a synthetic biological agent that does not naturally exist and for which no natural immunity could have been acquired." He later submitted to Congress a report suggesting that research into the area was necessary to defend against an enemy who might use such a weapon.

Mr. MacArthur was unavailable for comment Tuesday

Dynamac's draft environmental study was submitted by the Army to the Environmental Protection Agency's Denver regional office in February

Richard Sanderson, EPA's director of federal activities, told members of the House interior, foreign affairs and armed services committees Tuesday the EPA believes the new laboratory at Dugway "can be adequate from an environmental perspective" based on the study.

But Mr. Rifkin maintained that Mr. MacArthur's "veracity in developing this (study) is now questionable because of the research he did 20 years ago."

Mr. Rifkin said his organization, the Foundation on Economic Trends, will challenge the environmental study in court and has petitioned Defense Secretary Frank Carlucci to reject the study.

Mr. Rifkin's group filed a lawsuit in federal court in 1984 against the plan to build the new laboratory at Dugway and won an injunction in May 1985 preventing construction until an environmental study had been conducted.

A list of 129 laboratories, universities and other facilities where research is conducted for the Pentagon's Biological Defense Program was released by Mr. Rifkin at the hearing.

His group intends to try to generate local opposition to each of the facilities conducting such research in the 'elief that no measures are strong enough to ensure the public safety against such dangerous elements, Rifkin said.

Now U.S. officials believe there are 10 nations with biological weapons and 20 with chemical weapons.

Consolidated Safety Services, Inc. (CSS) history

https://dev.css-inc.com/whoweare/history.php

Brief History

Consolidated Safety Services, Inc. (CSS) was incorporated in 1988 to provide health and safety services to the public and private sectors. CSS rapidly expanded its services to include scientific program support in the physical and life sciences. For the last 20 years, CSS has been recognized as the nation's leading provider of motor carrier safety ratings for ground transportation systems.

Dynamac Corporation was established in 1970 to provide environmental, safety and health services primarily to the federal sector. It quickly added scientific research and development (R&D) and technology testing to its core services. Since 1995, Dynamac has been the leading provider of life science payload processing services for space transportation systems.

The CSS enterprise was created by the acquisition of Dynamac Corporation in May 2010. The acquisition immediately produced remarkable synergy enabling CSS to offer truly comprehensive environmental, safety & health services and robust scientific support capabilities. The acquisition allowed us to adopt the best of our combined business practices, IT systems, and analytical tools, and we seamlessly share our combined staff resources to meet the evolving needs of our many customers.

In 2005 an Employee Stock Ownership Plan (ESOP) was established. Today the CSS enterprise is 100% employee owned.

1996 Summary - Diana MacArthur - Dynamac Corporation - "Global Growth of Technology: Is America Prepared? a Working Conference"

[HB003V][GDrive]

Mrs. MacArthur is the Chair, Chief Executive Officer, and Co-founder of Dynamac Corporation , a firm providing integrated environmental services: environmental health and sciences consulting, natural resources management, and hazardous waste engineering. She has 35 years of experience in public policy and program development, spanning industry, the Federal Government, nongovernmental organizations, and academia. **Previously, she was President of a Dynamac subsidiary (merged in 1980) engaged in technology transfer, training and education, public outreach, and communications in areas of the environment, health, and safety.**

Earlier in her career, Mrs. MacArthur was the manager of the prevention arm of a multimillion dollar national clearinghouse for health information and education, operated by General Electric under a Federal Government contract. In early days of the Peace Corps, she served as Director of its Office of Private and International Organizations. And she was Vice President and Director of the Washington office of the Thomas J. Deegan Company, a public relations firm in the InterPublic group.

Mrs. MacArthur is active in public affairs. Currently, she serves the Federal Government in two capacities. Appointed by President Clinton, she is a member of the President's Committee of Advisors on Science and Technology (PC AST). She is a member of the Environmental Technologies Trade Advisory Committee of the U.S. Department of Commerce. In the past, she was a member of the Citizens Advisory Board to the President's Council on Youth Opportunity.

In the realm of nongovernmental organizations, Mrs. MacArthur is on the Advisory Board to the Center for Strategic and International Studies (CSIS), where she served on the Strengthening of America Commission and on the National Laboratories Steering Committee, a group that studied ways to enhance cooperation between the Department of Energy national laboratories and industry to commercialize technology critical to American economic growth and competitiveness. At present, she is a member of the CSIS Senior Policy Group on National Grand Challenges, a new project to identify the R&D priorities for the first quarter of the 21st century. **Mrs. MacArthur is a Director of the Atlantic Council**. She is also a member of the Advisory Council to the Committee for the National Institute for the Environment, and is an associate of the North American Institute, a think tank that deals with such issues as the North American Free Trade Agreement and the establishment of a North American Environmental Council. Since 1970, she has been a trustee of the Menninger Foundation.

In the academic arena, Mrs. MacArthur is a member of the Board of Visitors of the University of Maryland Biotechnology Institute and serves on the Chancellor's Advisory Council of the University of Maryland System. In addition, she is a member of the Board of the University of Maryland Foundation, Inc.

Mrs. MacArthur holds a B.A. in Economics from Vassar College, where she was elected to Phi Beta Kappa. She is the recipient of the 1993 KPMG Peat Marwick High Tech Entrepreneur Award, which honors individuals who have made significant contributions to the community and to the advancement of the high technology industry.

Lierz, Fearer

Janet Lea Lierz, daughter of Alberta Lierz of Holton, Kan., and the late Leroy Lierz, and John David Fearer, son of William Fearer and Mary Fearer, both of Annapolis, were married recently at Fairlawn Heights Wesleyan Church in Topeka, Kan.

The Rev. Ed Rotz performed the ceremony, and a reception was held at Abouds at Western Hills.

Given in marriage by her mother, the bride was attended by Amy Kalbach and Amy Lierz, her sister.

Army Major Thomas Guthrie served as best man for the groom. The ushers were Scott Burns, Stan Lierz, brother of the bride, and Mike George.

Mrs. Fearer is a graduate of Washburn University in Topeka with a degree in radiologic technology. She is employed as a cardiovascular radiologic technologist at St. Francis Hospital in Topeka.

Mr. Fearer is a graduate of Johns Hopkins University with a degree in geology. He is employed as an industrial hygienist at Dynamac Corporation in Fort Riley, Kan.

Following a wedding trip to Bermuda, the couple is living in Maple Hill, Kan.

National Library of Medicine, Office of Acquisitions Management, Building 38A, Room B1N17, 8600 Rockville Pike, Bethesda, Maryland 20894

B—HAZARDOUS SUBSTANCE DATA BANK FILE BUILDING SUPPORT SOL N/A POC Valerie M. Syed, Contract Specialist (301) 496-6546 It is the intent of the National Library of Medicine (NLM) to negotiate on a sole source basis with the Dynamac Corporation under the authority of FAR 6.302. The Dynamac Corporation was awarded a five-year contract (N01-LM-7-3512) in April, 1997 to provide file building and enhancement services for the NLM's Hazardous Substance Data Bank (HSDB) file. It was anticipated at the time of contract award that there would be 2 face-to-face meetings and one electronic review annually. In order to meet increased user demand for HSDB information, NLM expects to increase the number of updated and peer reviewed HSDB records. Update and peer review of an additional forty-five (45) database records is anticipated. The additional work can be accomplished by upgrading the current contract's previously scheduled 48th meeting of the Scientific Review Panel (SRP48) from an electronic review to a 3-day, face-to-face meeting. This enhancement to the previously scheduled meeting will require (1) approximately 1,500 additional labor hours, (2) travel and per diem costs for 16 SRP members to attend the 3-day meeting in Alexandria Virginia, and (3) costs to cover rental of the meeting room for 3 days. Because this activity represents a modification to an already existing contract activity, the National Library of Medicine intends to negotiate with the Dynamac Corporation on a sole source basis. The Dynamac Corporation is the best qualified company to perform this work because: 1) they have been conducting HSDB updates and review activities for over 15 years; 2) they are thoroughly familiar with the TOXNET file building system and the HSDB database conventions and procedures; and 3) they have on-site a complete collection of all HSDB sources. Because of the amount of detailed information about database operations and the length of time required to develop capacities for satisfactory performance, introducing a new contractor at this point in time would add significant additional training time, government coordination, and therefore, cost to the Government. This notice of intent is not a request for competitive proposals. However, all proposals received within forty-five days after the date of publication of this synopsis will be considered by the National Library of Medicine. See Numbered Note 22.**** (W-118 SN325367)

2002 (Jan 7) - $120M deal sends Md.'s Dynamac into orbit

By Chris Silva – Staff Reporter

Source - [HW004I][GDrive]

A woman-owned science and engineering contractor has won a $120 million contract from the National Aeronautics and Space Administration to provide life sciences and environmental support to the Kennedy Space Center in Florida.

The eight-year contract represents the 10th, and largest, award NASA has given Rockville-based Dynamac in the past six years.

"This one is really at the cutting edge of science," says Douglas Britt, Dynamac's project director. "NASA pushes science to its limits ... this is the largest single contract the company has ever had."

The award marks the second consecutive time Dynamac won a contract to provide environmental and life sciences services to NASA. Dynamac's first contract with NASA was valued at $63 million.

Diana MacArthur co-founded Dynamac with her late husband, Donald MacArthur, in 1970. The new NASA contract has her beaming with pride, particularly since the company had to compete against other proposals.

"It's very significant to us, a very profound space science," MacArthur says, adding that Dynamac also has won various grants over the years from NASA, typically worth about $300,000.

As part of the $120 million contract, more than 140 Dynamac scientists, engineers and technicians will provide scientific support to the Kennedy Space Center in 14 areas, including ground and air experiments.

Dynamac (http://www.dynamac.com) specializes in plant sciences and will track the condition of food that is grown on space flights. The company also provides support in areas of medical operations, landscape ecology, microbial contamination and animal research.

In addition, Dynamac and its primary subcontractor, Bionetics, will help establish and operate the Space Experiment Research and Processing Laboratory at the space center. This facility is expected to spearhead biotech projects. Bionetics, based in Newport News, Va., provides Dynamac with physicians and nurses for its programs.

Other agencies that utilize Dynamac's services include the Department of Defense and the Environmental Protection Agency.

In addition to providing support services, Britt says Dynamac is beginning to develop a technology pipeline that could lead to the development of life sciences products. The company has a patent on a plant growth regulator that NASA developed, and expects to grab more patents in the future.

The contract "has encouraged us to expand our work beyond NASA," MacArthur says. "It gives us a very good basis in science to work on other projects."

2005 - "DYNAMAC CORPORATION JOINS THE OMAHA POST"

http://www.sameomaha.org/files/newsletters/2005/Newsletter_2005_Winter.pdf

Established in 1970, Dynamac Corporation is a leading provider of environmental, program management, and research and development services to more than 20 Federal agencies, including the Department of Defense (DoD), National Aeronautics and Space Administration (NASA), and the U.S. Environmental Protection Agency (EPA). Operating out of 10 offices nationwide, our projects range from small, quick-response tasks to large, long-term, complex programs involving multiple subcontractors and collaborators. We are an award-winning, woman-owned small business with over 300 employees and an outstanding safety record. Few small businesses offer the breadth of services, years of management experience, and quality of service that Dynamac offers to its clients.

Dynamac has provided exceptional service to the U.S. Army Corps of Engineers Hazardous, Toxic, and Radioactive Waste Center of Expertise in Omaha for over five years. Dynamac is a nationwide contractor implementing the Formerly Used Defense Sites (FUDS) Information Improvement Plan (FIIP). Dynamac designed, developed, and is currently implementing systems to organize, digitize, and analyze environmental investigation and remediation records to ensure more efficient FUDS program management. Our approach has also been applied to several FUSRAP projects.

Dynamac has a long history with many DoD installations such as Fort Hood, Fort Bliss, Ft. Bragg, Fort Riley, and Aberdeen Proving Grounds developing and implementing environmental management systems; supporting environmental compliance, information technology, NEPA, and pollution prevention programs; managing hazardous materials and hazardous waste; and providing utility database support.

As a Sustaining member of several East and Southwest region Posts, we are enthusiastic about joining the SAME-Omaha Post and look forward to collaborating with the many professionals who support the military in its mission.

For additional information, please contact Angela Watmore at awatmore@dynamac.com and 301-417- 6005. Please visit our website at www.dynamac.com.

JONES-BROWN, Y'Vonne R. entered into Eternal rest on Monday, Sept. 30, 2013 at her home in Mitchellville, MD. Born, July 6, 1949 in St. Petersburg, Y'Vonne was a graduate of Florida Presbyterian College (Eckerd College) and the Massachusetts Institute of Technology where she received a PhD in Microbiology. After a post-doctoral fellowship at the University of California at Berkeley, Y'Vonne worked with the **National Institutes of Health and Dynamac Corporation before joining the United States Environmental Protection Agency (EPA).** Y'Vonne received a Bronze Medal, Mentor and Mission Awards from the EPA where she retired after 28 years in service. Passionate and tireless in her professional career, Y'Vonne also loved her family and home life. In her leisure she was a constant gardener and an avid reader. Y'Vonne enjoyed all manners of science including science fiction. Her occasional hobbies included stamp collecting, sewing and crafts. Her interests included improving the lives of impoverished children, protecting the planet on which we live, and preserving wildlife of all species. Y'Vonne is survived by her devoted husband of 38 years, Johndel; her son, Diallo; her sisters, Angella Allen and Mary E. Cleveland; and a host of nieces, nephews, including Jacinta Jackson and Demetrius Jackson, and many other relatives and friends. Memorial services for Y'Vonne will be held on Saturday, Oct. 26, 2013 from 11-1 pm at Dwight Jones Neighborhood Center, at 1035 Burlington Avenue North, St. Petersburg, FL 33705. For questions related to the service, please leave a message at 202-486-8275. In lieu of flowers, memorial contributions may be made to Doctors

The Portable Mac by Dynamac

Apple Backs Portable Mac By Dynamac

First Mac Laptop To Gain Approval

By Rory J. O'Connor

The 18-pound Dynamac offers a 640-by-400-pixel electroluminescent display.

GOLDEN, CO — Dynamac Computer Products Inc. and Apple Computer inked an agreement last week permitting Dynamac to buy discounted Macintosh Plus computers directly from Apple and reconfigure them into a portable package that includes a higher resolution display.

Dynamac said its first machines, also called Dynamac, will be available for sale early next year for between $5,000 and $8,000 and sold to specific vertical markets. Seven prototypes of the machine, which incorporates a 640-by-400-pixel electroluminescent display and weighs less than 18 pounds with a hard disk drive, are currently being demonstrated to several potential corporate and government accounts, according to company director Britt Blaser. The company said the standard display will show 46 percent more pixels than the standard Macintosh 512-by-342-pixel display.

The company is the first maker of portable Macintosh machines to receive official support from Apple, which claims it has the legal right to limit the reconfiguration of its machine by others who intend to resell it.

Two other companies, Colby Systems Inc. of Fresno, California, and Intelitec Inc. of Fairfield, Iowa, also say that they are negotiating for a similar agreement with the Cupertino, California-based Apple.

Intelitec said it is negotiating with Apple for a reseller agreement for its portable Mac.

Apple said its deal with Dynamac is not an exclusive one. "We are currently in discussions with a number of companies who want to do portable Macintoshes," said Marianne Lettieri, a spokeswoman for Apple.

Both Colby and Intelitec said they will make and sell portable Macs even without an Apple agreement, although Intelitec said it is close to signing a value-added reseller agreement. "We've got that paperwork in the process," said Roger Silber, Intelitec president.

Colby, which has a contract to provide the federal government with 120 portable Macs, now uses whole machines it buys outside of Apple but wants to obtain motherboards directly from Apple, said president Chuck Colby. The availability of separate components to makers, who don't use all the parts they get with the complete Macintosh Plus, could reduce the price of the portable machine "by roughly a few hundred dollars," Silber said. But Apple said it is unwilling to sell separate Macintosh components.

"We would not sell motherboards for the Mac," said Lettieri. "We have no plans to change that practice."

Any independent efforts to market a portable Mac could be shortlived, however, according to all three companies. They predict Apple will enter the market within the next year to 18 months.

Apple's Lettieri declined to discuss potential Apple products, but she did not deny that Apple might enter that market. "This relationship doesn't preclude us from having a laptop strategy," she said.

Borland Buys Spreadsheet From T/Maker

By Rory J. O'Connor

SCOTTS VALLEY, CA — Borland International said it has purchased the Click On Worksheet spreadsheet from publisher T/Maker Co. and will revamp it as part of a new release of Sidekick for the Macintosh.

The program, which includes graphics capabilities and the ability to view remote parts of the worksheet side-by-side, will likely replace part of the current Quiksheet feature in Sidekick for the Macintosh, according to company president Philippe Kahn.

Click On Worksheet, a desktop accessory originally released in April 1985, is currently being revised by Borland programmers to add new features, including horizontal scrolling and a data export format compatible with Microsoft's Excel spreadsheet, said Kahn. The product was revised earlier this year to correct incompatibilities between it and the Macintosh Plus when that machine was first announced, according to T/Maker.

Kahn would not disclose when the new version of Sidekick would be ready for delivery. But a Borland spokeswoman said the company will announce more formal plans for the Click On product in the first quarter of 1987. Kahn did indicate Sidekick's price will remain at $99.95.

Click On Worksheet can have up to 50 rows by 20 columns and can produce graphs, including bar charts, stacked bar charts, pie charts, and line graphs, from data in the spreadsheet, Borland said. The graphs can be pasted into an active worksheet. The product will also include a dozen templates previously supplied with the T/Maker version of the product.

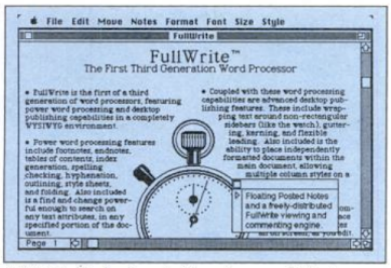
Borland purchased the product in the late summer, according to T/Maker president Heidi Roizen, when T/Maker decided the product no longer fit into its line of desktop publishing-related software. No announcement of the deal was made at the time, however, and T/Maker told potential buyers the $79.95 product had been discontinued, she said.

Ann Arbor Softworks to Unveil Mac-Based Word Processor

By Rory J. O'Connor

NEWBURY PARK, CA — Ann Arbor Softworks Inc. will introduce in January a Macintosh-based word processor it said will include a number of desktop publishing-related features not found on current word processing or desktop publishing products.

The company said the product, Full Write Professional, will include the capability to use multiple columns of differing sizes on a page and automatically wrap text around irregularly shaped figures. The program will be shown for the first time at the Macworld Expo in January, in San



Full Write Professional offers the capability to wrap text around irregularly shaped figures.

tions such as Mac Paint.

Dynamac Computer Products, Inc. - from Wikipedia

https://en.wikipedia.org/wiki/Macintosh_conversion

Dynamac Corporation, out of Denver, Colorado, also known as Dynamac Computer Products Inc., was founded as a Delaware corporation in 1970[30] and offered Mac portable computer systems between 1986[31] and 1991.[32]

Notable products include:

Dynamac[33][34] – was a Macintosh Plus converted into a black metal, 24-pound, portable Mac computer with a 9-inch back-lit amber electroluminescent screen and an optional, external battery pack. Based on an 8MHz 68000 CPU, and with pricing starting at $7,000, the Dynamac became obsolete with the introduction of the Apple Macintosh Portable in 1989.[35] Discontinued.

Dynamac EL[36] – based on the same Macintosh Plus system as the Dynamac, the EL used a black Cycolac plastic enclosure, reducing the weight to 18-pound and dropping the starting price to $6,000. It also became obsolete with the introduction of the Apple Macintosh Portable in 1989.[37] Discontinued.

Dynamac LC Display[38] – converted a Macintosh LC into a 13 ¾-pound portable Mac by attaching a 9.5-inch LCD display with 640-by-480 pixels resolution and 16 shades of grey to a Macintosh LC base system. Adding the optional battery added 2 ½ pound to the system's weight. Pricing started at $1,299 for the display kit, plus the cost of the Macintosh LC. Discontinued.

Dynamac IIsf[39] and IIsf/30[40] – this 11-pound Mac portable was based on converting a Macintosh LC into a leather-cased Mac portable with a built-in 9.5-inch LCD display with 640-by-480 pixels resolution and 16 shades of grey, a touchpad and an internal battery. The solution came either with the original donor Mac's 68020 CPU (IIsf) starting at a price of $4,995 or an 68030 CPU (IIsf/30) starting at a price of $6,995. Discontinued.

About

I've been forming companies and organizing projects since 1971 to take on under-appreciated opportunities. 1970s-80s: Real estate developer in Colorado, work requiring the formation of partnerships, creative financing and quasi-governmental agencies to deliver utilities and, in one case, to develop an interchange on a federal highway. Included a community shopping center, large-scale land developments and the invention of a solar home design for which I was awarded U.S. Patent.

_____

1971-1986 Real estate developer, Colorado.

1986-92: Angel, Founder & CEO of Dynamac Computer, the first authorized Macintosh 'clone' <ngov.us/dynamac>.

1992-93: Cofounder, The Trust Company of Washington, Seattle.

Also:

Patrol Leader, Colorado Outward Bound School;

USAF combat pilot, Vietnam (3-Distinguished Flying Cross, 2-Air Medal, 12 lesser);

U.S. Patent 4420036 <http://1.usa.gov/1aLWmx0>.

Trustee and Development Director, Colorado Academy;

Trustee, Colorado Children's Chorale;

Author, Xpertweb peer-to-peer reputation protocol;

Senior advisor for Internet strategy for the Howard Dean Campaign <blaserco.com/Dean>;

Senior architect for web strategy, Spirit of America <spiritofamerica.net>.

May 1986 – Aug 1992

Employment Duration6 yrs 4 mos

LocationDenver, CO

Dynamac <http://bit.ly/1dSXzbI> was the first Mac OS-based computer that was authorized, but not assembled by Apple Computer Inc. Based on a Mac Plus and, later, a Mac SE motherboard, Its purpose-built video board and power supply equipped the Dynamac to drive a bright 2-bit electroluminescent screen in a black case. It was purposely an homage to John Ellenby's earlier GRiD computer, and it inspired the same enthusiasm among Mac users.

Success was instant. Upon seeing a prototype at Macworld Expo Boston in August 1986, Apple solicited Dynamac Inc. to become a Value Added Reseller (VAR) and to demonstrate that Apple could offer an option as attractive as the industry-leading DOS-based Toshiba 3400, which the Dynamac matched in specifications (including weight), but added a graphic user interface.

Within a year, the Dynamac appeared on 3 magazine covers on 3 continents and received far more than its fair share of Macintosh press. For enterprises that required graphics-based computers in the field, it was the only cost-is-no-object option*. They included the US Army, the CIA, Bank of America's Internal Audit Dept., and a Who's Who of prominent Mac users in entertainment, media, etc. Naturally, Steve Jobs didn't think much of it.

The ride was wild and continued, in fits and starts, through mid-1992.

_____

*Primarily due to a $1,000 OEM electroluminescent screen, a fully configured Dynamac could run $10,000, if your dreams included 4 MB of RAM and a 40 MB Hard drive. Heady times indeed.

NewGov is a public utility for collaborating with and, when necessary, guiding politicians. NewGov.US supports crowd-sourced policy development for all US political jurisdictions and issues.

As policies are agreed upon by the national NewGov community, they are "pushed" to the relevant congressional committees by NewGov members who have been certified, by an authoritative 3rd party, as constituents of the committee members.

NewGov.US is certainly the necessary precondition for constituents to exercise real power in the country they own. It also appears to be sufficient to the task.

[For current corporate info as DynCorp, see DynCorp International]

DynCorp (/ˈ daɪnkɔːrp/),[5] most recently **DynCorp International**, is an American private military contractor.[6] Started as an aviation company, the company also provides flight operations support, training and mentoring, international development, intelligence training and support, contingency operations, security, and operations and maintenance of land vehicles.[7] DynCorp receives more than 96% of its more than $3 billion in annual revenue from the U.S. federal government.[8][9]

The corporate headquarters are in an unincorporated part of Fairfax County near Falls Church, Virginia. The company's contracts are managed from its office at Alliance Airport in Fort Worth, Texas.

DynCorp has provided services for the U.S. military in several theaters, including Bolivia, Bosnia, Somalia, Angola, Haiti, Colombia, Kosovo and Kuwait.[10] DynCorp International also provided much of the security for Afghan interim president Hamid Karzai's presidential guard and trains much of Afghanistan's and Iraq's fledgling police force.[11] DynCorp was also hired to assist recovery in Louisiana and neighboring areas after Hurricane Katrina.[12][13] DynCorp has held one contract on every round of competition since receiving the first Contract Field Teams contract in 1951. DynCorp won the LOGCAP II contract and is one of three contract holders on the current LOGCAP IV contract.[*clarification needed*][*jargon*]

History

Beginnings (1946–1961)

DynCorp traces its origins from two companies formed in 1946: California Eastern Airways (CEA), an air freight business, and Land-Air Inc., an aircraft maintenance company.[14] California Eastern Airways was founded by a small group of returning World War II pilots who wanted to break into the air cargo business.[15] They were one of the first firms to ship cargo by air, and within a year, the firm was serving both coasts.[16][17] California Eastern Airways diversified into multiple government aviation and managerial jobs, airlifted supplies for the Korean War, and was responsible for the White Sands Missile Range (a client that DynCorp has retained for 50 years).[15][17]

In 1951 Land-Air Inc., which implemented the first Contract Field Teams (teams of technicians that maintained military aircraft for the United States Air Force), was bought by California Eastern Aviation Inc.[17][18] DynCorp still holds the contract 50 years later, maintaining rotary and fixed-wing aircraft for all branches of the U.S. Armed Forces.[17] At this time, revenues for the company reached $6 million.[17]

In 1952 the company, renamed California Eastern Aviation, Inc., merged with Air Carrier Service Corporation (AIRCAR), which sold commercial aircraft and spare parts to foreign airlines and governments.[17]

Dynalectron (1962–1987)

By 1961 California Eastern Aviation needed a new name to reflect the growing and diversifying company. The name "Dynalectron Corporation" was selected from 5,000 employee suggestions.[17] In 1976 Dynalectron established headquarters in McLean, Virginia.[19] Due to its growing size, the company restructured into four main operating groups: Specialty Contracting, Energy, Government Services, and Aviation Services.[17] In the 30 years since the

restructured into four main operating groups: Specialty Contracting, Energy, Government Services, and Aviation Services. In the 30 years since the foundation of CEA, Dynalectron had acquired 19 companies in 30 years, had assets of $88 million, maintained a backlog of $250 million, employed 7,000, and had annual sales of $300 million.[17]

In 1964 Dynalectron diversified into the energy services business with the acquisition of Hydrocarbon Research, Inc.[20] Through this acquisition Dynalectron developed a process called H-Coal, which converted coal into synthetic liquid fuels.[21] The work began to attract national attention with the Arab Oil Embargos of the 1970s.[22] By the early 1980s Texaco Inc., Ruhrkohle AG, and C. Itoh & Co. were all marketing Dynalectron's H-Oil process.[23][24]

Between 1976 and 1981 the company had two public stock offerings and acquired another 14 companies.[25] By 1986 Dynaelectron was one of the largest defense contractors in North America.[25]

DynCorp and expansion (1987–2003)

In 1987 Dynalectron changed its name to DynCorp.[*citation needed*] In 1988 DynCorp went private to avoid a hostile takeover by Miami financier Victor Posner, via an employee initiative led by [**Daniel Richard Bannister (born 1930)**]. Bannister, as T. Rees Shapiro wrote in his 2011 obituary, "was paid $1.65 an hour when he joined DynCorp as an electronics technician in 1953," rising to serve as its president and CEO (1985 to 1997).

[For the rest, after the name change, see DynCorp International .]

Services

Air operations

DynCorp International provides aviation support to reduce the flow of illicit drugs, strengthen law enforcement, and eliminate terrorism.[35][36] Their air operations include the operation of fixed-wing and rotary aircraft on and around aircraft carriers for either combat or non-combat missions, aviation life support missions, and aerial/satellite imagery.[37][38] DynCorp was hired to strengthen the Afghan air force, helping to train Afghan pilots so they could, in turn, train other Afghans.[39] They have also provided air operations support in Iraq, including search and rescue, medical evacuations, and transporting quick reaction forces.[40][41]

Aviation

DynCorp International began as an aeronautical company in the 1950s and continues to provide aviation support globally. Aviation support including emergency response air programs,[42] aircraft maintenance,[43] theater aviation support management,[44] helicopter maintenance support,[45] supportability and testing.[35][36][46]

In 2012 DynCorp played a key part in the Space Shuttle Endeavour's final flight as it made its way from the Kennedy Space Center in Orlando to the California Science Center in Los Angeles aboard NASA's specially crafted Shuttle Carrier Aircraft (SCA). The SCA was a uniquely configured Boeing 747-100 aircraft.[47][*better source needed*][48] DynCorp mechanics worked with NASA and other support contractors performed maintenance and inspection services to the SCA. DynCorp's involvement in Endeavour's final flight was part of a contract NASA awarded to the company in April 2012 to provide aircraft maintenance and operational support at various locations throughout the country.[49]

Emergency response air programs

DynCorp has been working with the California Department of Forestry and Fire Protection (known as CAL FIRE) to suppress and control wild land fire.[50] DynCorp flies and maintains Grumman S-2 Tracker fire retardant air tankers and OV-10A aircraft, and maintains and services civilian UH-1H Super Huey helicopters flown by CAL FIRE pilots. Operating from across California, aircraft can reach most fires within 20 minutes.[50]

Aircraft maintenance

DynCorp provides aircraft maintenance, fleet testing and evaluation for rotary, fixed, "lighter-than-air", and unmanned aircraft.[37][38] Specifically, they provide on-site work for project testing, transient, loaner, leased and tested civilian aircraft services. DynCorp also performs supportability and safety studies as well as off-site aircraft safety and spill containment patrols and aircraft recovery services.[51] DynCorp has received contracts for aircraft maintenance with the United States Navy,[46] the U.S. Air Force,[52] the U.S. Army,[53] and NASA.[54] DynCorp provides aircraft maintenance in countries including the Republic of the Philippines,[55] the United States, throughout Europe, Southwest Asia, the Middle East, and Africa.[44] Additionally, DynCorp provides aircraft maintenance support to facilities including the NAS Patuxent River,[56] Johnson Space Center in Houston, the Langley Research Center in Hampton, Virginia, NASA facilities in El Paso, Texas, Edwards Air Force Base in California,[54] and Robins Air Force Base (AFB) in Georgia.[52]

Among its notable awards is its unbroken record of having received a contract in every round of competition under the United States Air Force-managed Contract Field Teams (CFT) program since the CFT program started in 1951.

The company recently opened up an office in Huntsville, Alabama, to allow it to further focus on its aviation business. The Army Materiel Command, Army Contracting Command and the U.S. Army Security Assistance Command all have or soon will have their headquarters on Redstone Arsenal.[57] The U.S. Air Force chose DynCorp to supply support services for the military's T-6 and T-6B trainer aircraft. As part of that contract DynCorp will open, operate and manage Contractor Operated and Maintained Base Supply facilities at nine Air Force and Navy locations.[58]

Helicopter maintenance support

DynCorp International has been the incumbent recipient of helicopter maintenance and support contracts supporting the U.S. Army, the U.S. Air Force, and the U.S. Navy.[41][59] It also received the task order to provide theater aviation support management for US Army helicopters in Europe (TASM-E).[60] The U.S. Army Contracting Command gave DynCorp International a contract to provide a maintenance augmentation team for the Kuwait Air Force's AH-64D Apache helicopter maintenance program. DynCorp has worked as a partner for supporting the Air Force's fleet of 39 F/A-18 Hornet aircraft program since 1997.[59][61]

History[edit]

Beginnings (1946–1961)

[See **Dynalectron Corporation**]

Dynalectron (1962–1987)

[See **Dynalectron Corporation**]

DynCorp and expansion (1987–2003)

In 1987 Dynalectron changed its name to DynCorp.[citation needed] In 1988 DynCorp went private to avoid a hostile takeover by Miami financier Victor Posner, via an employee initiative led by [**Daniel Richard Bannister (born 1930)**]. Bannister, as T. Rees Shapiro wrote in his 2011 obituary, "was paid $1.65 an hour when he joined DynCorp as an electronics technician in 1953," rising to serve as its president and CEO (1985 to 1997).[27]

In 1994 DynCorp's revenues were approximately $1 billion.[citation needed] By the time of his retirement in 2003, Shapiro notes that [**Daniel Richard Bannister (born 1930)**] "oversaw the acquisition of more than 40 companies… [and] was credited with helping to mold… an aviation services company into a sprawling conglomerate that employed 24,000 people and earned $2.4 billion in annual revenue."[27] As well he "oversaw DynCorp contracts to operate missile test ranges for the Defense Department, develop vaccines for the National Institutes of Health and install security systems in U.S. embassies for the State Department."[27] Shapiro notes that during Bannister's tenure Dyncorp had also "supplied bodyguards to Haitian President Jean Bertrand Aristide in the 1990s and to Afghan President Hamid Karzai in the early 2000s."[27]

With the reductions in military spending in the 1990s, DynCorp expanded their focus to the growing tech market.[15] It bought 19 digital and network service firms and acquired contracts with the government's information technology (IT) departments.[15] By 2003 roughly half of DynCorp's business came from managing the IT departments of the Central Intelligence Agency, Federal Bureau of Investigation, and the U.S. Securities and Exchange Commission, among others.[15] In 1999 DynCorp moved its headquarters to Reston, Virginia.[17]

In December 2000 DynCorp formed DynCorp International LLC, and transferred all its international business to this entity.[citation needed] DynCorp Technical Services LLC continued to perform DynCorp's domestic contracts.[citation needed]

Sale to CSC, IPO, and purchase by Cerberus Capital (2003-present)[edit]

In March 2003 DynCorp and its subsidiaries were acquired by Computer Sciences Corporation (CSC) for approximately $914 million.[28] Less than two years later, CSC announced the sale of three DynCorp units (DynCorp International, DynMarine and certain DynCorp Technical Services contracts) to Veritas Capital Fund, LP for $850 million.[28] After the sale, CSC retained the rights to the name "DynCorp" and the new company became DynCorp International.[29]

In 2006 DynCorp International went public on the New York Stock Exchange under the symbol DCP.[30]

On April 12, 2010, DynCorp International announced a conditional deal to be acquired by private equity investment firm Cerberus Capital Management for $17.55 per share ($1 billion).[31] The deal was agreed on 7 July 2010.[32]

In December 2011 the company hired Michael Thibault, former co-chairman and commissioner of the Commission on Wartime Contracting in Iraq and Afghanistan (CWC), as vice president of government finance and compliance. Thibault worked for many years at the Defense Contract Audit Agency (DCAA), serving as Deputy Director from 1994 to 2005.[33] In 2011 Dyncorp set a company record with 12,300 new hires, bringing the total number of employees to 27,000.[34]

Services[edit]

Air operations[edit]

A DynCorp employee working with aviation support

DynCorp International provides aviation support to reduce the flow of illicit drugs, strengthen law enforcement, and eliminate terrorism.[35][36] Their air operations include the operation of fixed-wing and rotary aircraft on and around aircraft carriers for either combat or non-combat missions, aviation life support missions, and aerial/satellite imagery.[37][38] DynCorp was hired to strengthen the Afghan air force, helping to train Afghan pilots so they could, in turn, train other Afghans.[39] They have also provided air operations support in Iraq, including search and rescue, medical evacuations, and transporting quick reaction forces.[40][41]

Aircraft maintenance[edit]

DynCorp provides aircraft maintenance, fleet testing and evaluation for rotary, fixed, "lighter-than-air", and unmanned aircraft.[37][38] Specifically, they provide on-site work for project testing, transient, loaner, leased and tested civilian aircraft services. DynCorp also performs supportability and safety studies as well as off-site aircraft safety and spill containment patrols and aircraft recovery services.[51] DynCorp has received contracts for aircraft maintenance with the United States Navy,[46] the U.S. Air Force,[52] the U.S. Army,[53] and NASA.[54] DynCorp provides aircraft maintenance in countries including the Republic of the Philippines,[55] the United States, throughout Europe, Southwest Asia, the Middle East, and Africa.[44] Additionally, DynCorp provides aircraft maintenance support to facilities including the NAS Patuxent River,[56] Johnson Space Center in Houston, the Langley Research Center in Hampton, Virginia, NASA facilities in El Paso, Texas, Edwards Air Force Base in California,[54] and Robins Air Force Base (AFB) in Georgia.[52]

Among its notable awards is its unbroken record of having received a contract in every round of competition under the United States Air Force-managed Contract Field Teams (CFT) program since the CFT program started in 1951.

The company recently opened up an office in Huntsville, Alabama, to allow it to further focus on its aviation business. The Army Materiel Command, Army Contracting Command and the U.S. Army Security Assistance Command all have or soon will have their headquarters on Redstone Arsenal.[57] The U.S. Air Force chose DynCorp to supply support services for the military's T-6 and T-6B trainer aircraft. As part of that contract DynCorp will open, operate and manage Contractor Operated and Maintained Base Supply facilities at nine Air Force and Navy locations.[58]

Helicopter maintenance support[edit]

DynCorp International has been the incumbent recipient of helicopter maintenance and support contracts supporting the U.S. Army, the U.S. Air Force, and the U.S. Navy.[41][59] It also received the task order to provide theater aviation support management for US Army helicopters in Europe (TASM-E).[60] The U.S. Army Contracting Command gave DynCorp International a contract to provide a maintenance augmentation team for the Kuwait Air Force's AH-64D Apache helicopter maintenance program. DynCorp has worked as a partner for supporting the Air Force's fleet of 39 F/A-18 Hornet aircraft program since 1997.[59][61]

Contingency operations[edit]

A significant part of the company's business since the 1990s has come from contingency operations[62] support.[63] The company supports existing bases in Southern Afghanistan, builds new ones as needed, and provides base support services.[64]

Development[edit]

DynCorp international development

In January 2010 DynCorp International combined with World Wide Humanitarian Services (WWHS) and Casals & Associates to form DI Development.[65] DI Development provides humanitarian aid, reconstruction to conflict and post-conflict areas, and governance reforms.

DynCorp International made several acquisitions in 2009 and 2010 to adapt to the defense sector's shift towards diplomacy and development work, in particular acquiring an international development firm in order to enter the international aid community.[66] DI Development is particularly active in Africa and Latin America. In Africa DI Development strengthened government financial management in Ghana, assisted in peace and recovery advancement in Uganda, and led anti-corruption programs in Madagascar, Malawi, and Nigeria.[67][68] In Latin America DI Development implemented anti-corruption, transparency, and accountability programs in Guatemala, El Salvador, Nicaragua, and Panama, and provided democracy and governance initiatives in Mexico, Bolivia, and the Dominican Republic.[69]

Intelligence training and solutions[edit]

In 2010 DynCorp International acquired Phoenix Consulting Group to expand the company into intelligence training and solutions.[70][*better source needed*][71] By acquiring the Phoenix Consulting Group, DynCorp provides training courses to the intelligence community at the Phoenix Training Center.[72] Dyncorp International employs 300 intelligence professionals to offer highly specialized training for intelligence, counterintelligence, special operations and law enforcement personnel.[73] It also provides linguist operations, including language training, translation specialists recruiting, and field translation support for the U.S. armed forces.[74]

Through a joint venture with McNeil Technologies called Global Linguist Solutions, Dyncorp was awarded a five-year contract to provide management of translation and interpretation services to support U.S. Intelligence and Security Command (INSCOM) as part of Operation Iraqi Freedom.[75] Under the contract, DynCorp employed 6,000 locally hired translators and 1,000 U.S. citizens who are native speakers of languages spoken in Iraq.[76] DynCorp International was also given a $17.1 million task order to provide leadership to military personnel of the Democratic Republic of the Congo. The program focuses on training junior and mid-level personnel in areas such as communications, logistics, and engineering.[77]

DynCorp president Steven Schorer expects the training and support logistics for the military and intelligence community to grow significantly in the coming years.[78]

Two DynCorp American employees were among the five killed in Jordan by a co-worker on 9 November 2015. The incident occurred at the International Police Training Centre in Zarqa. The program the men were working on is funded by the State Department's Bureau of Diplomatic Security and Bureau of International Narcotics and Law Enforcement.[79]

Operations and maintenance[edit]

DynCorp provides military base operations and vehicle maintenance. They manage installations for military bases for the Department of Defense and the Department of State, and provide security services, fire and rescue emergency services, and IT/telecommunication services. In particular, DynCorp supports a military base camp in Kosovo, providing power plant maintenance, fueling services, and grounds maintenance.[80] DynCorp is also active in vehicular maintenance, in particular providing the United Arab Emirates with depot-level maintenance, facilities management, and commercialization for its 17,000 ground vehicles.[81] In April 2012 DynCorp International was awarded a contract with the U.S. Navy to provide facility support services for personnel from the Naval Mobile Construction Battalion unit Timor-Leste, including living quarters, internet and telephone services, bathroom facilities, laundry services, kitchen facilities, vehicle/driver/language support, procurement services, warehousing and other services.[82]

DynCorp also formed a joint venture with Oshkosh Defense, Force Protection Industries, and McLane Advanced Technologies to pursue a $3 billion five-year

DynCorp also formed a joint venture with Oshkosh Defense, Force Protection Industries, and McLane Advanced Technologies to pursue a $3 billion five-year Army contract for support and maintenance of mine-resistant ambush-protected vehicles.[78] The U.S. Defense Department gave DynCorp the Nunn-Perry Award in recognition of its mentor-protege arrangement with CenterScope Technologies, in which it provided coaching in development of new markets, establishing international operations and in worldwide logistics. As a result of this mentoring CTSI's revenue grew from $5 million to $32 million in 18 months.[83]

Security services[edit]

DynCorp provides personal security throughout various parts of the world.[84] It supplies Africa, Latin America, and the Middle East with threat assessment protection, perimeter security, base security, and guard services.[85] DynCorp supported the U.S. Army in the Persian Gulf with vehicle searches, roving patrols, and explosive-detecting dogs.[86] It also provides personal security to many regions of Iraq and Afghanistan.[87]

Culpeper National Security Solutions is a unit of DynCorp.[88]

Training and mentoring[edit]

DynCorp delivers training for multiple sectors, including security sector reform, interior and defense personnel in underdeveloped nations, and law enforcement. Since 1994 DynCorp has trained and deployed 6,000 law enforcement workers in 16 countries, including Iraq and Afghanistan.[89][90] DynCorp is looking to partner with Raytheon as a prime or subcontractor on the Teach, Educate, Coach program, which is part of the Army's Warfighter Field Operations Customer Support program.[78]

Controversies[edit]

Latin America incidents[edit]

See also: Colombian armed conflict and Plan Colombia

In September 2001 Ecuadorian farmers filed a class-action lawsuit against DynCorp. On February 15, 2013, the court granted summary judgment to DynCorp, dismissing the sole remaining human health and medical monitoring claims Ecuadorian plaintiffs had brought in connection with counternarcotic aerial herbicide spraying operations in southern Colombia.[91] The plaintiffs are preparing to appeal the dismissal.[92]

An extensive accusation concerning DynCorp's activities and alleged abuses in Colombia was presented against DynCorp at the Hearing on Biodiversity of the Permanent Peoples' Tribunal, session on Colombia at the Cacarica Humanitarian Zone from February 24 to 27, 2007.[93]

Three DynCorp employees died when their helicopter was shot down during an anti-drug mission in Peru in 1992.[8]

On November 29, 2008, a lengthy *New York Times* article questioned the potential conflict of interest in the hiring by Veritas Capital Fund, LP, holding company for DynCorp, of Gen. Barry McCaffrey. McCaffrey had previously served as White House "Drug Czar", where he shaped future federal public-private partnership in drug enforcement policy.[94]

Sex trafficking of children in Bosnia[edit]

According to Human Rights Watch, there is substantial evidence that points to the involvement of DynCorp contractors in trafficking of women and girls in Bosnia and Herzegovina, as well as violence against them.[95]

In the late 1990s two employees, Ben Johnston, a former DynCorp aircraft mechanic, and Kathryn Bolkovac, a U.N. International Police Force monitor, independently alleged that DynCorp employees in Bosnia engaged in sex with minors and sold them to each other as slaves.[96][97][98] Johnston and Bolkovac were fired, and Johnston was later placed into protective custody before leaving several days later.[99]

On June 2, 2000, an investigation was launched in the DynCorp hangar at Comanche Base Camp, one of two U.S. bases in Bosnia and Herzegovina, and all DynCorp personnel were detained for questioning.[99] CID spent several weeks investigating and the results appear to support Johnston's allegations.[99] DynCorp had fired five employees for similar illegal activities prior to the charges.[100] Many of the employees accused of sex trafficking were forced to resign under suspicion of illegal activity. As of 2014 no one had been prosecuted.[101]

In 2002 Bolkovac filed a lawsuit in Great Britain against DynCorp for unfair dismissal due to a protected disclosure (whistleblowing), and won.[102] Bolkovac co-authored a book with Cari Lynn titled *The Whistleblower: Sex Trafficking, Military Contractors And One Woman's Fight For Justice*. In 2010 the film *The Whistleblower*, starring Rachel Weisz and Vanessa Redgrave, was released.[103][104]

Iraq incidents[edit]

According to *The New York Times*, the Special Inspector General for Iraq Reconstruction (SIGIR) found that "DynCorp seemed to act almost independently of its reporting officers at the Department of State, billing the United States for millions of dollars of work that were not authorized and beginning other jobs without a go-ahead."[105] The report states that the findings of DynCorp's misconduct on a $188 million job to buy weapons and build quarters for the Iraqi police were serious enough to warrant a fraud inquiry.[105] A U.S. government audit report of October 2007 revealed that $1.3 billion was spent on a contract with DynCorp for training Iraqi police.[106] The auditors stated that the program was mismanaged to such an extent that they were unable to determine how the money was spent.[106]

In February 2007 federal auditors cited DynCorp for wasting millions on projects, including building an unapproved, Olympic-sized swimming pool at the behest of Iraqi police officials.[107] In April 2011 DynCorp agreed to pay $7.7 million to the U.S. government to settle claims that it had inflated claims for construction contracts in Iraq.[108]

On October 11, 2007, a DynCorp security guard in a U.S. State Department convoy killed a taxi driver in Baghdad. According to several witnesses, the taxi did not pose a threat to the convoy's security.[109]

A January 2010 SIGIR report assessed that oversight of DynCorp police training contracts by the Bureau of International Narcotics and Law Enforcement Affairs found that INL exhibited weak oversight of the DynCorp task orders for support of the Iraqi police training program.[110][111][112] It found that INL lacks sufficient resources and controls to adequately manage the task orders with DynCorp. As a result, more than $2.5 billion in U.S. funds were vulnerable to waste and fraud, although SIGIR's Iraq reconstruction inspector Stuart Bowen noted that there was no indication that DynCorp had misspent any of the $2.5 billion.[113][114]

billion.[115][116]

Afghanistan incidents[edit]

In 2009 DynCorp contractors paid a 15-year-old Afghan Bacha Bazi performer to perform lap dances and entertain them in Kunduz. Several Afghans were later arrested and investigated.[115][116][117] A Wikileaks cable released after the incident stated that the Afghan interior minister at the time, Hanif Atmar, asked the assistant U.S. ambassador to try to "quash" both the story and release of video from the incident.[115][118][119][120] In response to the incident, DynCorp fired four senior managers and established a chief compliance officer position, which focused on ethics, business conduct, related investigations, and regulatory compliance.[116] As of 2014 no DynCorp employee has faced criminal charges.[*citation needed*]

On July 30, 2010, a riot broke out when an Afghan car and a DynCorp vehicle crashed on a road near Kabul International Airport.[121][122] Although initial reports blamed the company and claimed four Afghans were killed in the accident, Sayed Abdul Ghaffar, the head of the Kabul police criminal investigations division, told *The New York Times* that the Afghan driver had caused the accident and said only one Afghan died in the wreck.[123]

Mozambique incident[edit]

According to Mozambican media reports, the Mozambican government seized and incinerated the 16-vehicle shipment pending the outcome of investigations into alleged tax evasion and deception by OTT Technologies Mozambique.[124]

Trump administration lobbying[edit]

DynCorp lobbied the Trump administration intensely to get the Trump administration to rescind a $10 billion contract that the Obama administration made with a rival company to service State Department aircraft.[12]

Article - Company-Histories

[...]

Private Company ; Incorporated: 1946 as California Eastern Aviation Inc.

Employees: 23,000

Sales: $1.81 billion (2000)

NAIC: 541513 Computer Facilities Management Services; 54169 Other Scientific and Technical Consulting Services; 56121 Facilities Support Services

Company Perspectives: The personal commitment of each DynCorp employee to our core values creates a consistent and exemplary level of service and ethical conduct, making DynCorp one of the most respected companies in the world.

Key Dates:

- 1946: Pilots returning from World War II form CEA air cargo business.
- 1951: CEA merges with AIRCAR civil aviation services company.
- 1961: CEA is renamed Dynalectron Corporation.
- 1964: Hydrocarbon Research, Inc. is acquired.
- 1976: Dynalectron restructures and relocates to McLean, Virginia.
- 1987: Dynalectron becomes DynCorp.
- 1988: Management buyout takes DynCorp private following a hostile takeover attempt from Miami financier Victor Posner.
- 1994: Annual revenues reach $1 billion as company focuses on IT.
- 2001: Growth in local and state government services helps push backlog to $6 billion.

Company History:

DynCorp, one of the largest employee-owned firms in the United States, has not been a very high-profile company, yet its behind-the-scenes logistics support operations for the Defense Department are extensive. The company provides ground support for Air Force One, maintains the State Department's telephones, and contracts coca (cocaine) eradication missions in Colombia. The U.S. Department of Defense accounts for a little less than half of DynCorp's total revenues. Some of DynCorp's earliest customers, such as the White Sands Missile Range in New Mexico, have remained loyal to the company for more than 50 years. CEO Paul Lombardi expects continued growth, most especially in providing services to state and local governments, due to the lack of a dominant player in that highly fragmented market.

War Surplus Origins

California Eastern Airways, Inc. (CEA) was not the only air cargo line started by military pilots returning to the United States after World War II. Nor was it the most enduring, as a purely civil transport enterprise. CEA would diversify, however, into one of the country's most important defense contractors. Within a year of its founding in 1946, California Eastern was serving both coasts. The company participated in the U.S. military airlift during the Korean War.

How To Detect a Forgery

The purchase of Land-Air, Inc. in the early 1950s brought CEA into a new field of technical services. Land-Air operated missile ranges and modified aircraft for government agencies. In 1951, CEA's total revenues exceeded $6 million. The next year, the company merged with Air Carrier Service Corporation

(AIRCAR), which sold commercial aircraft and spare parts to foreign airlines and governments. AIRCAR left the civil aviation business in 1957, focusing instead on defense and aerospace engineering, commercial electronics, and data management.

Dynalectron in 1961

By 1961, CEA needed a new name to more accurately reflect its diversified empire. The name Dynalectron Corporation was culled from 5,000 employee suggestions.

Dynalectron diversified into the energy services business via the 1964 acquisition of Hydrocarbon Research, Inc. At the end of the decade, the company instituted a plan to expand the commercial aviation services business while entering the specialty construction contracting field.

In 1976, Dynalectron established a headquarters in McLean, Virginia. The company restructured into four main operating groups: Specialty Contracting, Energy, Government Services, and Aviation Services. Dynalectron had made 19 acquisitions in its 30 years.

CEO Charles G. Gulledge reported that Dynalectron ended 1976 with stockholders' equity of $30 million, assets of $88 million, and a backlog of $250 million, all record numbers. Annual sales were a bit less than $300 million in the mid-1970s. The company posted a $1.5 million loss in 1978 due to write-downs on wastewater treatment plants being built by a subsidiary, AFB Contractors Inc. After this loss, the company ended its diversification program, focusing instead on cost-cutting to reduce debt.

One of the company's smaller subsidiaries provided the prospect of continued growth. Since 1963, the company's Hydrocarbon Research (HRI) unit had been developing a process to liquefy coal to produce a fuel for boilers. This work attracted national attention due to the Arab oil embargos of the 1970s and the public debate over energy policy. By the early 1980s, Texaco Inc., Ruhrkohle of West Germany, and C. Itoh & Co. of Japan had agreed to market Dynalectron's proprietary H-Oil process.

Other projects in which Dynalectron was involved included training helicopter pilots and technicians in Saudi Arabia. By 1981, Dynalectron had acquired another 14 companies, mostly in the aviation services field, which now encompassed cargo handling and aviation fueling. The company also had established a computer component repair business. Two public offerings of stock helped provide the capital for the purchases.

Revenues were $640 million in 1985; a third of the company's business was coming from the Defense Department. Revenues grew to $749 million in 1986.

In April 1987, Dynalectron agreed to pay $1.5 million to settle two bid-rigging cases related to its largest subsidiary, Dynalectric Co. A spokesman maintained the settlement was more a matter of financial expediency than an admission of any wrongdoing.

New Name, New Owners in the Late 1980s

Dynalectron adopted the DynCorp name in 1987. The company had become North America's fourth largest electrical contractor; its defense contracting and aviation services businesses were also considerable.

In early 1988, a management buyout took DynCorp private again and established an Employee Stock Ownership Plan (ESOP) following a hostile takeover attempt from Miami financier Victor Posner. An investment group led by DynCorp Chairman Jorge E. Carnicero paid $246 million for the company.

A restructuring grouped the company, which had 16,000 employees, into Government Services and Commercial Aviation Services divisions. DynCorp instituted a strategy to make it less dependent on defense work: by 1995, according to the plan, 40 percent of its contracts would not be defense-related, the professional services business would grow, and the company would achieve annual sales of $1.2 billion.

DynCorp aggressively pursued the emerging information technology (IT) business in the early 1990s, buying ten companies between 1990 and 1993 (Bell Technical Operations; Program Resources, Inc.; Meridian Corporation; Viar & Company; Aerotherm Corporation; Becon Services; B-K Dynamics; Science Management Corporation's Information Systems Division; Technology Applications, Inc.; and Network Management Inc.). A new group, Applied Sciences, was formed to encompass them in 1990.

Another business unit, Information & Engineering Technology (I&ET), was formed in 1994, charged with capturing large IT service contracts. In October of that year, DynCorp bought CBIS Federal Inc., renaming it DynTel Corporation.

DynCorp revenues reached the $1 billion mark in 1994. The company had posted losses, however, for the previous five years. Profits returned as revenues slipped to $909 million in 1995; new contacts worth $1.7 billion pushed the company's backlog toward the $3 billion mark. DynCorp reported receiving six merger proposals after posting the results.

In August 1995, DynAir, the commercial aviation unit, was sold in two pieces to Sabreliner Corp. of St. Louis and London's Alpha Airports Group PLC. DynAir had accounted for 5,000 of DynCorp's 23,000 employees.

Focus on IT in the 1990s

Under CEO [Daniel Richard Bannister (born 1930)], DynCorp was dedicating itself to its role as one of the fastest growing providers of IT services in the Washington, D.C. area. Still, these services were accounting for less than 20 percent of the company's total revenues. Most of the company's work came from the low-tech "roads and commodes" end of the business.

Dyncorp posted record revenue and backlog figures in 1996, giving ample reason to celebrate during the company's 50th anniversary year. At the beginning of 1997, another banner year, [Daniel Richard Bannister (born 1930)] became company chairman while Paul V. Lombardi assumed the titles of president and CEO. Lombardi had joined the firm five years earlier as head of its Governmental Services Group.

Some new businesses were added during the mid-1990s. Data Management Design, Inc., a provider of workflow solutions, was acquired in 1996. DynSolutions, added in 1997, developed information management systems for commercial users. DynCorp Management Resources, also added in 1997, focused on state and local government services.

In February 1998, DynCorp bought FMAS, a health information systems provider. Later in the year, DynCorp entered a unique public-private partnership to operate the Virginia Space Flight Center.

GTE Information Systems was acquired in late 1999 and renamed DynCorp Information Systems. It would soon install a unique, completely wireless computing infrastructure at Virginia Union University. The acquisition was one of DynCorp's more troublesome; the company eventually sued GTE for misinformation regarding the profitability of a phone system for prisoners.

During 1999, DynCorp moved to a new headquarters building in Reston, Virginia. The company's impressive financials continued to grow throughout the late 1990s and into 2000, in large part due to an industry-leading 66 percent contract win rate. Backlog was $6 billion in the spring of 2001.

DynCorp organized its healthcare services business under the new AdvanceMed LLC subsidiary in January 2001. Reve- nues were about $75 million a year; the unit specialized in predictive outcome analysis for large insurers and hospitals.

Lombardi was bullish on the prospect of future growth in services for state and local governments, due to its huge size and lack of dominant players. DynCorp's Management Resources unit had grown 40 percent in 1998 alone. In late 2001, DynCorp planned to merge this business with TekInsight, a public IT company, holding a 40 percent ownership in the new company to be called DynTech.

The September 11 terrorist attacks on the World Trade Center and the Pentagon had implications for a variety of DynCorp's lines of business. The company operated INS stations along the Mexican border. According to the Washington Business Journal, many defense agencies consulted with the firm regarding contingency plans and the government asked DynCorp to make its emergency telephone system completely wireless. DynPort Vaccines, a joint venture with Porton International Ltd., researched biological weapons.

Principal Subsidiaries: AdvanceMed LLC; Dyn Marine Services, Inc.; DynCorp Information Systems LLC; DynCorp Management Resources, Inc.; DynCorp Systems & Solutions, Inc.; DynCorp Technical Services; DynCorp TechServ; DynSpace Corporation; DynTel Corporation.

Principal Divisions: DynCorp Information and Enterprise Technology; DynCorp Information Systems; DynCorp Technical Services.

Principal Competitors: Electronic Data Systems Corporation; Lockheed Martin Corporation; PRC Inc.; Raytheon Company; Science Applications International Corporation; TRW Inc.

Company History:

E-Systems, Inc. is one of the leading defense electronics companies in the United States. This diversified company designs, develops, produces, and services high technology systems, especially surveillance, verification, and aircraft ground-land navigation equipment, primarily for defense applications around the world. The company also develops electronics programs and systems for business, industrial, and nondefense government programs and agencies. Much of E-Systems' business serves the government national security market, with more than two-thirds of its business falling within the two primary areas of intelligence and reconnaissance command, control, and communications. The company includes five divisions and four wholly owned subsidiaries.

The company's definition of electronic warfare includes "timely detection, identification, location, and tracking of the electromagnetic emissions associated with foreign communications and weapons systems," and refers to strategic systems for intelligence, reconnaissance and surveillance applications, tactical systems relating to electronic countermeasures, and jamming and deception devices. The company's command, control, and communications segment includes communications equipment as well as command and control systems to process data for analysis and decision making. **The company develops and produces a wide range of systems, including air traffic control systems for the Federal Aviation Administration and communications systems for NATO.** The guidance, controls, and navigation segment develops and manufactures flight controls for commercial and military aircraft, including missile steering and tracking systems. The aircraft maintenance and modification area provides specialized service for aircraft of all types, both military and commercial.

E-Systems' predecessor company was created in December 1964 when the LTV Temco Aerospace division of Ling-Temco-Vought Inc. formed LTV Electrosystems, Inc. as a wholly owned subsidiary. In April of the following year, LTV Electrosystems became a publicly-held subsidiary and was listed as an over-the-counter stock. During the summer of that year, it acquired from its parent nearly all of the operating properties of LTV Military Electronics Division (known as the Garland Division), Continental Electronics Manufacturing Company, and Continental Electronics Systems, Inc. It also opened a new facility in South Carolina as an adjunct to its Greenville Division. Sales for 1965 were almost $81 million, with net earnings of $2.1 million.

During the period from 1965 to 1972, the company focused on expansion. A series of acquisitions began during this time that included such companies as Memcor, Inc., Pickard & Burns Electronics, the Eagle Transport Company. However, overly rapid growth led to large debt and deteriorating profits, and the company was forced to divest itself of some companies, only a year or two after acquiring them, to cut costs and rid itself of marginal operations that could not promise high enough return for the financial risk involved. In 1969, a Memcor plant and most of the assets of Continental Electronics Manufacturing

Company were sold because of low profits.

By 1970, the company had returned to profitability; it had net sales of almost $200 million with earnings of $2.8 million, up from the previous year's net loss of $4 million. **LTV Electrosystems acquired American Standard Inc.'s Melpar Division in 1970 and established a new Commercial Services Division in Greenville to perform heavy structural modification and maintenance for the airlines**. In 1971 LTV Electrosystems acquired Hamilton Watch Company's Electronics division and established a new domestic international sales company known as Electrosystems Export Company. Nevertheless, after unloading several of its acquisitions, employment in 1970 was down to 7,000 from a high in 1968 of more than 11,000.

In 1972, E-Systems emerged as an independent, publicly owned corporation, headed by John W. Dixon, who had served as LTV Electrosystems' president and chief executive officer since 1969. During its first year as a public company, sales reached $156 million, and, with $34 million spent on research and development, total company assets amounted to $90 million. The company employed 5,500 employees, 26 percent of whom were engineers, scientists, and technicians. The entire company occupied less than three million square feet of floorspace.

The 1970s was a decade of reorganization and acquisition for the newly renamed E-Systems Inc. In 1973, the company formed its Aircraft Systems Group through consolidation of its Greenville and Donaldson divisions and the newly acquired Serv-Air, Inc. Serv-Air maintained, modified, and supported all National Aeronautics and Space Administration (NASA) aircraft flown by the astronauts at the Johnson Space Center in Houston. That year, E-Systems also consolidated its Montek, Garland, and Melpar divisions with the newly-acquired TAI, Inc. to form the Electronics Systems Group. TAI was an engineering firm providing consulting services for the construction of telecommunications networks around the world. E-Systems further acquired a major product line called Digicom from GTE Sylvania to augment the company's data systems capabilities. Offices in Korea and Brazil were opened in addition to an international office at the Dallas headquarters.

In 1973, E-Systems' Greenville Division began providing depot maintenance, logistics support, and special modifications for aircraft belonging to the U.S. Air Force's Special Air Mission Fleet. This important contract provided service for aircraft used by the president of the United States, the vice-president, and cabinet members.

In 1974, the Memcor Division became the basis for the newly formed Production Electronics Group. During this time, E-Systems acquired Electronic Communications, Inc. and Air Asia Co., Ltd. of Taiwan from Air American, Inc. In 1976, the company formed an Energy Technology Center for research on developing practical uses for solar energy. The Commercial Division was established in 1978, and merged with the TelSatCom Division the following year.

By the mid 1970s, E-Systems was the world's top supplier of military radios and large earth station antennas for satellite communications as well as one of the top technical consultants for microwave telecommunications systems. E-Systems' business consisted of about 55 percent defense contracts and 45 percent international, industrial, and other nondefense contracts. The company was investing considerable research and development funds in digital techniques, microminiaturization, surface acoustic wave devices, digital processing, and voice and video compression.

E-Systems began its participation in the automation of air traffic control in 1981 with the development and production of the Flight Service Automation System (FSAS) for the Federal Aviation Administration. By 1990, the system included an extensive nationwide network of 400 computers and 3,000 display terminals involving 18,000 airports. It provided general aviation pilots with weather briefings and navigation advisories and assisted them with the filing of flight plans. Updated replacement systems for FSAS provided extensive use of satellite technology and color displays for windowing weather graphics and textual data.

E-Systems had record sales of $827 million in 1983 and booked new orders amounting to more than $900 million. The company's Garland Division was awarded a $31 million contract by McDonnell Douglas Corporation to upgrade the U.S. Air Force F-4G aircraft with a system to suppress enemy surface-to-air missiles and anti-aircraft artillery systems. The system utilized special electronic warfare equipment along with anti-radiation missiles and conventional weapons. This contract substantially increased the importance of the company's electronic warfare product area. That year Fortune magazine rated E-Systems first among company's known for high returns to investors over the past ten years.

The company substantially increased its research and development budget in 1984, concentrating heavily on defense electronics; electronic warfare; and command, control and communications. Over the following year, more than 65 percent of the company's sales were generated by electronic warfare equipment and systems, and sales and new order bookings were at an all time high. E-Systems expanded many of its facilities, opening a total of 264,000 square feet of automated production and engineering facilities at the Communications Manufacturing Division in St. Petersburg, Florida, and the Garland Division. It also added 240,000 square feet of engineering and administrative space at ECI in St. Petersburg and Melpar, based in Falls Church, Virginia.

In 1986, for the first time in its history, E-Systems had sales of more than $1 billion. By this time, employment was at 15,000 with 45 percent of the employees engaged as engineers, scientists, and technicians. The company occupied more than 5.6 million square feet of floor space; research and development expenditures were at a record $211 million; and company assets totaled over $600 million.

This was also the last full year in which John W. Dixon served as chair and chief executive officer. Dixon stepped down in 1987 to become Chairman Emeritus, and was succeeded by David R. Tacke. Under Tacke, the company outbid Lockheed and General Dynamics to develop an important new program known as the Joint Service Imagery Processing System (JSIPS). JSIPS was a transportable ground station for multisensory processing and dissemination of national strategic and tactical imagery. E-Systems also completed a mammoth processing system utilizing high speed programs able to process information at a rate of four billion bits per second and store more than one and a half trillion bits. Analysts compared the processing of this amount of data to processing the contents of the Library of Congress in an average work day. The system, which could take up to an acre of floor space, provided information to top military and civilian defense officials.

In the international arena, E-Systems sold its Taiwanese-based subsidiary Air Asia, after finding it incompatible with the rest of the company's business. The company next entered into a joint venture with the West German company GROB TFE to develop the EGRETT-1, a single-engine, turboprop aircraft. E-Systems was responsible for the plane's aircraft systems integration, which could be adapted for commercial communications, environmental protection activities, or scientific applications such as geophysical surveys. In 1990, E-Systems entered into TELOS, a joint venture with German partners formed for the operational maintenance and logistics support of EGRETT aircraft programs. E-Systems considered this EGRETT program an important opportunity through which to develop its international marketplace, which the company considered a big growth area despite the difficulties in exporting sensitive high technology

Tacke served as head of the company only until spring 1989, when E. Gene Keiffer, the former president and chief operating officer became chair and CEO of E-Systems. That year the company acquired Engineering Research Associates, located in Vienna, Virginia, a technology leader in the field of high-frequency surveillance systems.

Also during this time, the company was continuing its work on high performance, high speed computer systems and software, applying Very High Speed Integrated Circuit, Monolithic Microwave Integrated Circuit, and Gallium Arsenide technologies to specialized military systems. E-Systems developed artificial intelligence applications for defense systems, as well as specialized systems and programs for speech processing, digital imagery enhancement, and data base management. The company also explored the field of neural networking, which allowed computers to recognize and analyze patterns of information. Work continued in the area of mass data storage as well as the development of a robotic, mass storage library system using cassettes instead of computer tapes. Furthermore, the company became involved in research concerning new ways to apply fiber optic technology to defense systems.

E-Systems acquired HRB Systems Inc. from Hadson Corp. in 1990 for $65 million, half the price Hadson had paid only two years before. Hadson attributed HRB's decreased market value and declining sales to the end of the Cold War. E-Systems CEO Keiffer, however, thought the investment was a good one, observing that the new acquisition would complement and expand E-Systems' position in the advanced intelligence and reconnaissance systems marketplace. HRB designed and developed signal collection, processing, and analysis systems and was based in State College, Pennsylvania, with about 1,300 employees.

Also in 1990 E-Systems finally settled a criminal and civil lawsuit involving its production of radios for the U.S. Army. The radios were supplied by E-Systems' Memcor division, which had been providing tactical radios to the Army for more than 15 years and at one time had been the world's leading producer of such equipment. In 1985, the Army terminated for default two contracts with Memcor totaling about $19 million. Following the cancellation, E-Systems was forced to shut down Memcor, laying off most of the division's employees. The company appealed the Army's terminations and also filed a $13-million claim against the Army. In early 1988, the federal government informed E-Systems that it was initiating a criminal investigation to determine whether the company had violated any procurement regulations associated with the cancelled contracts. The government charged that three managers and a supervisor at the Memcor plant had neglected to report test failures and repairs as required and, moreover, created fake documents on untested radios. Several former E-Systems employees were indicted for the test falsifications; E-Systems plead guilty to the charges and agreed to pay $4.6 million in fines. (The former complyees were acquited of the criminal charges.) In addition, as part of the settlement, E-Systems agreed to drop its suit against the government. Payment of the fines enabled E-Systems to continue to do business with the U.S. government.

In 1993, as the Cold War ended and eastern and western Germany became unified, Germany announced a freeze on defense contracts, a move that affected profits at E-Systems. The EGRETT project was scrapped for both financial and political reasons; analysts estimated that the contract would have brought in between $600 million and $1 billion for E-Systems through the end of the decade.

Consequently, E-Systems began to focus increasingly on commercial and industrial markets over the next few years, emphasizing the adaptation of leading edge technologies for existing systems and applying those technologies in new ways to serve nonmilitary purposes. The company sought wider distribution of its robotic data storage system, EMASS, developed for use by defense and intelligence agencies for storing massive amounts of data on tape cartridges. Major oil companies had purchased the systems to keep track of seismic data, but E-Systems was still having difficulty breaking into other information-intensive industries. In 1993 E-Systems entered into agreements with IBM, Conves, and Cray Research to help market the system. IBM agreed to include the EMASS system along with other data storage systems it marketed.

Other nondefense projects included a contract with the California Department of Forestry and Fire Protection to operate and maintain the state's 31 aircraft in support of the its wildfire suppression program. Furthermore, the U.S. Department of Education established a $16 million contract with E-Systems for a national student loans and grants database. The company had previously won a data processing contract for the government's Stafford Loan program, formerly known as the Guaranteed Student Loan program. In the medical field, a new E-Systems unit, E-Systems Medical Electronics, Inc., worked to promote the company's image-processing, distribution, and storage technology, acquiring Advanced Video Products, Inc., a Massachusetts-based medical electronics company, in the process.

Nevertheless, U.S. Defense Department and military work continued to generate the bulk of E-Systems' income. During 1992, the company's Serv-Air division received a contract from the Army, expected to generate more than $600 million over four years, to operate and manage activity for the Special Operations Command by providing maintenance, repair, logistics support, systems engineering, and system modifications for military helicopters, avionics equipment, and communications equipment. In early 1993, E-Systems received a $64 million contract to provide two Learjet instrumentation systems and to train pilots and maintenance workers and provide spare parts supplies as well as operator and maintenance manuals. This contract was expected to generate as much as $400 million with its renewal options.

In an E-Systems annual report of the early 1990s, management observed that "in an environment of reduced U.S. forces abroad, reconnaissance, intelligence collection, and signal processing become even more important." E-Systems speculated that the industry could become more competitive as other defense contractors sought to replace lost programs by entering E-Systems' niche in reconnaissance and surveillance, communications, and special aircraft integration. Company officials expected that international sales would be the company's greatest source of growth in years to come as other nations assumed more responsibility for their own security. They also predicted that nonmilitary contracts would account for ten percent of business by the end of the 1990s.

Principal Subsidiaries: E-Systems Medical Electronics, Inc.; HRB Systems, Inc.; Serv-Air, Inc.; Engineering Research Associates, Inc.

Name Head Of Sylvania Facility

NEW SHREWSBURY — Walter Edgington, a specialist in electronic countermeasures, surveillance and communications, has been appointed manager of the engineering and support facility being established in the Fort Monmouth area by Sylvania Electric Products Inc.

Sylvania is a subsidiary of General Telephone and Electronics Corporation.

Scheduled to begin operations in March, the new Sylvania facility will be known as the Monmouth Engineering Center (MEC). It will serve as a center for systems analysis, development, test, evaluation and maintenance in support of such organizations as the Army Electronics Command, Project Mallard Program Office, the Communications - Electronics Agency, and the Army Satellite Communications Agency.

Mr. Edgington joined Sylvania in 1966 as an engineering specialist at its Electronic Defense Laboratories in Mountain View, Calif. Since that time he has served in staff capacity planning and coordinating tactical reconnaissance, electronic warfare, and anti-submarine warefare programs.

The new Sylvania facility is in the Mid-Monmouth Industrial Park, less than a mile from the Electronics Command's headquarters.

Busy Spring Market For Realty Broker

FAIR HAVEN — Mrs. Olivia S. Dutcher, five-star broker of the sales staff of the Ray Van Horn Agency, Realtors, reports a busy spring market and says her record of sales is far ahead of last year's.

Mrs. Dutcher has earned bonuses in the months of March and April for sales exceeding the office's maximum goal.

Mrs. Dutcher was the broker in the sale of a brick and frame ranch house in the Heathcliff section of Rumson for Potere Inc. The residence, more than 110 feet long, is set far back on a wooded plot near Rumson Road with a lot frontage of 413 feet. The purchasers are Mr. and Mrs. Walter R. Edgington from Sunnybank, Calif. Mr. Edgington is in charge of the Monmouth Engineering Center for Sylvania Electric Products, Inc., a division of General Telephone and Electronics Corporation.

1973 (Sep 03) - Commerce Today - "Welcome,But Where Have You Been?" Construction Trade Mission Asked"

PDF : Commerce Today, all second-half 1973 issues : [HP004K][GDrive]

DISCUSSION IN BAHRAIN—*Joseph Rossetti (right), of Allis-Chalmers, describes his firm's equipment to Mohamed Jalal (center), a leading Bahraini merchant, and one of his managers.*

'Welcome, But Where Have You Been?' Construction Trade Mission Asked

"Welcome — we like Americans and your products but where have you been?" This seemed to be the general comment of most leading merchants and government officials in five countries and eight cities visited by a recent Building and Construction Trade Mission to the Middle East.

The 12 Mission members found a genuine interest in reversing the limited U.S. presence in a market that is growing at astounding rates occasioned by increasing oil revenues in a stronghold of free enterprise philosophy. Specific opportunities were found in areas of design and consultancy, construction, maintenance and service of existing and future facilities and industrial joint ventures.

Construction projects abound in areas of housing, airports, hospitals, communications systems, universities and schools. While in some countries initial major projects such as port facilities have been or are nearing completion, development planning continues at a rapid pace.

Emphasizing the potential market for U.S. goods and services, Mahmoud A. Taiba, Deputy Minister of Commerce and Industry for Saudi Arabia, pointed out to mission members that "made in U.S.A." still represents quality in Saudi Arabia and that quality is in many cases as important a factor as price.

Time for U.S. initiative

The Mission found that U.S. building materials and equipment generally were in good demand. In the Gulf States, due to long British official presence, the first sources of supply still are predominantly British. However, contractors and merchants indicated a strong interest and desire for U.S. participation in the market particularly for highly technically designed products.

The United Arab Emirates, with its more recent increase in revenues, is just beginning to open up for high quality design services and construction supervision. "Architectural and engineering opportunities for U.S. firms should increase when one or two major buildings are built under new U.S. concepts," according to Louis McMillan, President of The Architects Collaborative of Cambridge, Mass.

While the Middle East markets are expanding at an outstanding rate, so is the competition. A number of leading Chamber of Commerce and Government officials pointed out that while there is high respect for the quality of American equipment and services, many jobs and opportunities have gone to other competing nations primarily due to their attention to the market. Some of the key suggestions made and reiterated by U.S. Embassy Officers in each of the countries visited are:

► Personal contacts—the Arab world works on personal friendship and trust. Personal attention cannot be overemphasized as a means of developing a local market for goods or services. Frequent visits and diligent followup by company representatives to their agents and customers is a must.

► A good agent—in each of the countries visited the importance of a local agent was stressed; indeed in many countries it is mandatory.

► After-sales service—successful firms in the marketplace attributed much of their success to meticulous attention to maintenance and after-sales service. This is not only necessary to meet the competition but to maintain the reputation of a product in a market which is increasingly able to demand after-sales service and parts availability as a condition of sale. Strong, on-the-ground agent support and training pays big dividends.

Mission members met with over 200 potential representatives during the trip and expect to appoint a total of 58 local agents or representatives. In most countries one agent for the country was deemed adequate. However in Saudi Arabia, because of the nature of the market, many firms appoint several agents with specific territories such as Jidda, Riyadh and the Eastern Province.

Ross P. Wright, President of Reed International Sales Co., Erie, Pa., summed it up this way: "I accomplished about 300 percent more than expected on this trip in signing agents for my products.

DISCUSSION IN JIDDA—*Theodore A. Arapoglou (left), of Arpol Petroleum, ezplains business objectives to Yousuf Bannan (right), Secretary General of the Jidda, Saudi Arabia, Chamber of Commerce and Chamber member Omar Badahdah.*

Alone, on a personal mission to the area, these agency contacts would have taken over three months or more, if I could have made them at all."

The Mission was comprised of 11 U.S. company executives, four of whom are presidents of their own companies. Their product and services lines included architectural and engineering planning, public utility and environmental engineering, heavy construction equipment, building materials, concrete pipe and brick, steel tools and special lubricants, household specialty equipment, communications and field product management systems. After visiting Kuwait, Saudi Arabia, Qatar, the U.A.E. and Bahrain, the mission estimates resulting sales and services at $20 million, following establishment of agency agreements.

Mission members were J. S. Rossetti, Allis Chalmers Overseas, Milwaukee; Theodore A. Arapoglou, Arpol Petroleum Co., New York; Luis Arias, Besse Overseas Corp., Alpena, Mich.; Walter Edgington, General Telephone and Electronics Sylvania, Washington, D.C.; Sebouh Toukhanian, KDT, Inc., Huntington Woods, Mich.

Also, Frank La Due, McCracken Concrete Pipe Machinery Co., Sioux City, Iowa; W. A. Cheney, Metcalf and Eddy, Boston; Hassan Abu Middain, J. I. Case Co., Racine, Wis.; Ross P. Wright, Reed International Sales Co., Erie, Pa.; Louis A. McMillan, The Architects Collaborative, Cambridge, Mass., and William S. Lord, U.S. Steel International, New York. James H. LeFeaver, Director of the U.S. Regional Trade Development Office, Beirut, was Mission Director.

Document Change

Beginning on Jan. 1 the only acceptable form of the alternate (horisontal) Shipper's Export Declaration will be Commerce Form 7525-V-Alternate-Intermodal, the Bureau of the Census has announced.

Until that time, both the old Alternate Shipper's Export Declaration, Form 7525-V-Alternate, revised Sept. 15, 1971, and the current Alternate Intermodal Form, Form 7525-V-Alternate-Intermodal, dated Jan. 1, 1971, will be acceptable. No change in the continued acceptability of the regular (vertical) Shipper's Export Declaration, Commerce Form 7525-V is involved.

National Foreign Trade Meeting To Hear McCoy

The 60th National Foreign Trade Convention will be held Nov. 12-14 at the Waldorf-Astoria Hotel, New York, with Charles B. McCoy, of E. I. du Pont de Nemours & Co., serving as chairman and keynote speaker for the international business community.

Robert M. Norris, president of the National Foreign Trade Council, sponsors of the meeting, announced that "Essentials for Restructuring the International Economic System" will be the convention theme.

Sessions and forums of the convention will be concerned, among other issues, with international monetary reform and finance; international management; foreign private investment; the balance of payments; international trade policy; East-West trade, and multinational corporate citizenship.

Sessions On China Added To East-West Seminars

Briefing sessions on doing business with the People's Republic of China have been added to a series of East-West trade seminars in New York, Sept. 25-27; Chicago, Oct. 29-31; Los Angeles, Nov. 27-29, and Atlanta, Dec. 12-14.

The newly-established National Council for U.S.–China Trade is co-sponsoring the sessions with the Washington-based International Management and Development Institute. Speakers will examine the role of the next two Canton Trade Fairs as a means of evaluating and entering the China market.

For further details see story in *Commerce Today*, Aug. 20, Page 34, or write: Nancy Joseph, International Management and Development Institute, Watergate Office Bldg., Suite 905, 2600 Virginia Ave., N.W., Washington, D.C. 20037.

Opening statement by Senator Inouye 1

CHRONOLOGICAL LIST OF WITNESSES

APRIL 28, 1975

Biller, Joel W., Deputy Assistant Secretary for Economic Affairs and Business Activities, Department of State; accompanied by Harry Cahill, Chief, Business Relations Division; and Nicholas S. Lakas, Director, Office of Commercial Affairs 17
Dobbin, Tilton H., Assistant Secretary for Domestic and International Business, Department of Commerce; accompanied by Dr. Charles W. Hostler, Deputy Assistant Secretary for International Commerce; Stanley Katz, Deputy Director of International Economic Policy and Research; and Vernon E. Godsey, Acting Director, Office of Budget 2
Fasick, J. Kenneth, Director, International Business Division, General Accounting Office; accompanied by John Milgate, Associate Director; Fred Dziadek, Assistant Director; Joseph Ferri; and William M. Edmondson 25
Prepared statement 29

APRIL 29, 1975

Opening statement by Senator Inouye 35
Browne, Harry, director, National Association of Export Management Companies of New York, and chairman of the National Federation of Export Management Companies of Washington, D.C. 82
Dashner, Doug, executive administrator, Iowa Development Commission 43
Questions of Senator Inouye and the answers thereto 52
Edgington, Walter, on behalf of the Government Products Division, Electronic Industries Association; accompanied by William A. Simcox, director, planning and requirements programs of the Government Products Division 63
Questions of Senator Inouye and the answers thereto 81
Farley, James N., president of Speedfam Corp., representing the National Machine Tool Builders' Association; accompanied by James Gray, executive vice president; and James Mack, public affairs director 55
Questions of Senator Inouye and the answers thereto 61
Harwell, James H., executive director, Texas Industrial Commission and immediate past president, National Association of State Development Agencies 46
Questions of Senator Inouye and the answers thereto 53
Keller, Gerald, Keller Publishing Co., Great Neck, N.Y. 94
Orr, Hon. Robert D., Lieutenant Governor, State of Indiana 89
Silverman, Theodore N., deputy director, Illinois Department of Business and Economic Development 36
Questions of Senator Inouye and the answers thereto 50

[HG009W][GDrive]

6. I thoroughly agree. Some larger companies are sufficiently staffed and are financially capable of doing the job on their own. On the other hand, the small and medium-sized companies which comprise our association depend on NMTBA and the government for support of their export activities. No company, regardless of its size, can accomplish the role played by the U.S. government in identifying new markets and opening the door to potential customers overseas.

I'm not sure whether the reduction in Commerce Department services and reliance on floating exchange rates creates a bias in favor of large multinational companies. However, it would be fair to say that no company in our industry has the capacity to move fast enough in and out of domestic and overseas markets to take advantage of the effect of floating exchange rates.

I hope these answers will be helpful to you in the formulation of your subcommittee's report.

Sincerely,

JAMES N. FARLEY,
President, Speedfam Corporation, representing the National Machine Tool Builders' Association.

Senator INOUYE. Our next witness is Mr. Walter Edgington, representing the Electronic Industries Association of Washington, D.C.

Welcome, sir. Would you care to identify your associate before proceeding?

STATEMENT OF WALTER EDGINGTON IN BEHALF OF THE GOVERNMENT PRODUCTS DIVISION, ELECTRONIC INDUSTRIES ASSOCIATION, WASHINGTON, D.C.; ACCOMPANIED BY WILLIAM A. SIMCOX, DIRECTOR, PLANNING AND REQUIREMENTS PROGRAMS OF THE GOVERNMENT PRODUCTS DIVISION

Mr. EDGINGTON. Thank you, sir. I am accompanied today by Mr. William A. Simcox, director of the planning and requirements programs of the Government Products Division, Electronic Industries Association.

We welcome this opportunity to present the views of our industry on the reduction in the export promotion program of the Department of Commerce.

The Electronic Industries Association is composed of 240 member companies employing over 1 million people. Members of the government products division are involved in providing equipment and services to the National Aeronautics and Space Administration, the Department of Transportation, ERDA, and most other Government departments and agencies, including, of course, the Department of Defense.

Many companies in recent years have sought new markets in various countries with the aid of the export promotion programs of the Department of Commerce. It is our general opinion that these programs have contributed greatly to redressing the imbalance in trade that has developed and in stemming the gold flow.

[HG009X][GDrive]

[Slide 1 follows:]

ELECTRONIC INDUSTRIES ASSOCIATION

GOVERNMENT PRODUCTS DIVISION

The Government Products Division of Electronics Industries Association is comprised of a large number of firms, some major in size, some middle level, and some small corporations, as well as some research firms.

Our statement today concerns the proposed cut in the international marketing and export promotion side of the Department of Commerce.

[HG009Y][GDrive]

[Slide 2 follows:]

DEPARTMENT OF COMMERCE
DOMESTIC AND INTERNATIONAL BUSINESS ADMINISTRATION
FISCAL YEAR 1976 REQUEST

	POSITIONS	AMOUNT ($000)
PRESIDENT'S PROPOSED FY 1976 APPROPRIATION REQUEST	829	$27,975
FY 1975 CONGRESSIONAL APPROPRIATION	993	$34,472
	−164	−6,497

THE FY 1976 REQUEST IS ***164 POSITIONS*** AND ***$6,497,000*** LESS THAN FY 1975 REQUEST.

At the outset, let me say that the industry concern is not the amount of money in this cut. In the total budget, this does seem like a small amount. More to the point, however, is the theory behind this cut and how it affects our companies who use this unique service support provided by the export promotion people in the Department of Commerce.

[Slide 3 follows:]

NEW POLICY ON EXPORT PROMOTIONAL SERVICES

» FULL COST RECOVERY «

- ***Department of Commerce, beginning in FY-76, must set fees to recover 'FULL COST' of providing export promotional services to established exporters.***
- ***New fee schedule is estimated to be at least double or possibly triple the present level.***
- ***Fee increases will drive established exporters away from Commerce promotional programs.***
- ***Commerce-sponsored promotional events will diminish in number and size, denying new exporters needed market access.***
- ***RESULT: An increasing impact on U. S. ability to sell overseas.***

[HG009Z][GDrive]

The concept called "full-cost recovery" is related to this cut in international marketing and export promotion. We have studied the theory of full-cost recovery and disagree with both the concept and principal.

In the first place, industry pays corporate taxes in the process of manufacturing and developing and selling its product. Governmental structures are developed as a result of needs of both the people of the Nation and the institutions of the Nation, which includes corporations.

These governmental structures in turn are paid for by the taxation levied. It therefore appears inequitable for industry to be asked to pay for this service again. Further, in addition to requiring payment for the promotion service, full-cost recovery presumes that the related government department overheads will be loaded back onto the cost of the service.

Therefore, what we are talking about is double payment. Our companies would be paying taxes for a level of government support and then asked to pay the Government for specific direct support service.

Additionally, there is a differentiation in the degree of payment contained in full-cost recovery. Firms who are new to market will be levied at one cost level. Firms that are experienced in the export trade will be levied at a higher cost. Firms that are experienced in export trade will therefore be asked to pay sometimes two or three times the amount levied on the smaller and "new-to-market" firms. The levy will work a hardship on both types of firms, the experienced export corporation and the "new to market", but in different ways.

For example, the larger export firm will evaluate the increased costs of using the export promotion service in relation to particular fairs, trade shows, catalog shows, or similar events, as well as their other associated cost. If the new cost for the service is significant enough, there will be a management judgment made not to participate, or a judgment may be made to use those moneys to market separate or individually.

As a result, the constructive collaboration between the U.S. Government and major exporters may diminish. This collaboration and participation in major international events has proven highly efficient in the past. These promotional activities have related to the initial contacts that have led to many very large sales to the benefit of the entire U.S. economy. Some of these initial contacts have been made under the general umbrella of the U.S. Government support at a trade fair, exhibition or sponsored function.

Smaller firms will generally join with a larger group of firms because the group attracts interest and enhances the small firms' participation. As larger firms' participation fall off, smaller firms will shy away because there isn't the critical mix necessary to make a successful show. Therefore, in either the case of the large firm or the small firm, the cutting back of the export promotional services may have a negative effect.

[HG00A0][GDrive]

[Slide 4 follows:]

OVERALL IMPLICATIONS OF COMMERCE BUDGET REDUCTION

THIS REDUCTION COULD JEOPARDIZE --

- ***$2 BILLION OF U.S. EXPORT SALES ANNUALLY***
- ***$3.2 BILLION IN GNP***
  $1 dollar exports = $1.60 added to GNP
- ***$100 MILLION IN TAX RECEIPTS***
- ***140,000 JOBS IN U.S. INDUSTRY ****

**** $1 billion in exports = 70,000 jobs (Bureau of Labor Statistics)***

We have evaluated this negative effect and interpret it in terms of what it can mean in total export sales of the Nation. These interpretations are difficult to make and are predicated on past experience.

Generally, it appears that a reduction of the degree proposed and the subsequent reduction in the exposure and visibility of industry under the auspices of the U.S. Government would result in a loss of $2 billion of U.S. export sales annually. Using a general rule of thumb, a dollar in export trade times the multiplier effect in our manufacturing cycle results in a $1.60 increase in the Gross National Product. We are then talking about a loss of approximately $3.2 billion in the Gross National Product.

A still more critical element, other than the loss to the Government of corporate taxes on the related manufacturing, is the loss of U.S. high technology manufacturing jobs. A key factor in our economy is maintenance of this high technology market at a reasonably high volume in order to retain a strong industrial base.

A billion dollars of exports equates to approximately 70,000 jobs, so when we are talking about a loss of approximately $2 billion in export sales we are speaking of 140,000 export related jobs for U.S. workers.

[HG00A1][GDrive]

[Slide 5 follows:]

ANNUAL REDUCTION IN SERVICES FOR U.S. INDUSTRY DUE TO COMMERCE BUDGET CUTS

- ***CUTBACKS IN OVERSEAS PROMOTIONAL ACTIVITY:***
  - 65% REDUCTION OF TRADE FAIR PROGRAM
  - 52% REDUCTION OF TRADE MISSIONS PROGRAM
  - 47% REDUCTION OF IN-STORE PROMOTION OF CONSUMER PRODUCTS
  - 55% REDUCTION OF COMMERCIAL PRESENCE FAIR PROGRAM
  - 10% REDUCTION IN SCOPE OF TRADE CENTER EXHIBITIONS
- ***RESULT:***
  - LOSS OF OVER 85,000 SALES LEADS WHICH THESE PROGRAMS COULD BE EXPECTED TO GENERATE
  - $530 MILLION LOSS OF EXPORT SALES

We have projected on slide 5 how Commerce may react to this cut and what the likely cutbacks would be in their promotional activity.

For example, it is suggested that 65 percent of their trade-fair program will be reduced, and over 50 percent of the trade-mission program. For those of us who travel abroad under the auspices of the U.S. Government, either in a trade mission or at an International Trade Show, the umbrella of the U.S. Government is a vital and very valuable asset.

Participation, for example, in a trade mission enables one to meet the senior ranking citizens of a nation at several sponsored functions. One meets leading bankers, brokers, investors, potential agents and people who are looking for joint ventures and the possibility of introducing high technology into their nation in various productive areas.

This unique service support is provided by the export promotion program, and is one of the more outstanding successes offered by the Department of Commerce.

Because industry has had a very favorable relationship in this area, there is a certain amount of alarm when we see an impending potential reduction of this scope. More specifically, we expect that the above reductions will result in a loss of contacts that we might otherwise make by participating in these various shows, missions, and other sponsored overseas activity which may cost us over 85,000 leads.

Given our past experience in relating sales to contacts, we are then thinking in the order of a loss of somewhere in the order of $530 million in export sales.

[HG00A2][GDrive]

[Slide 6 follows:]

ANNUAL REDUCTION IN SERVICES FOR U.S. INDUSTRY DUE TO COMMERCE BUDGET CUTS (Continued)

- ***ADDITIONAL EXPECTED RESULTS:***
  - REDUCTION IN THE DISSEMINATION OF MAJOR OVERSEAS SYSTEMS AND PRODUCT LEADS --
    * $225 MILLION LOSS OF EXPORT SALES
  - REDUCTION OF ASSISTANCE DESIGNED TO SUCCESSFULLY CLOSE MAJOR PROJECTS/PRODUCTS CASES --
    * $400 MILLION LOSS OF EXPORT SALES
  - REDUCTION IN NEW-TO-EXPORT/NEW-TO-MARKET (NTE/NTM) TARGET INDUSTRY EXPORT ACTIONS (900), NTE/NTM NON-TARGET INDUSTRY EXPORT ACTIONS (975) AND TRADE OPPORTUNITIES PROGRAM SUBSCRIPTIONS SOLD (700) RESULTING FROM AN 10% CUTBACK IN THE FIELD STAFF --
    * $105 MILLION LOSS OF EXPORT SALES
  - ELIMINATION OF TWO GLOBAL MARKET SURVEYS (PRODUCT MARKET RESEARCH IN 40 COUNTRIES) --
    * $80 MILLION LOSS OF EXPORT SALES ANNUALLY

There are numerous more detailed Department of Commerce projects, which industry and Commerce have reliberated on in the past, and where an interested industry has suggested what surveys, market scoping, or attache work is necessary, that will be curtailed. It is difficult for industry to say to you that we are going to lose a certain amount of business because certain market scoping or governmental sponsorship functions may not occur. As you can see from this, the whole problem is somewhat pragmatic.

Co-related to our export sales and this Government service support promotional activity is the problem of our trade imbalance.

[HG00A3][GDrive]

[Slide 7 follows:]

THE U. S. BALANCE OF TRADE PROBLEM
(millions of dollars)

	1973	1974	1975 (Est.)
EXPORTS	71,153	99,772	111,000
IMPORTS	69,806	102,837	118,520
BALANCE:	+1,347	-3,065	-7,520*

HOW DO WE BALANCE THE DEFICIT?

- ☆ ***Decrease imports?***
- ☆ ***Devalue dollar?***
- ☆ ***Reduce standard of living?***
- ☆ ***INCREASE EXPORTS?***

*Includes services, private transfers and official transfers

SOURCES: ORGANIZATION FOR ECONOMIC COOPERATION AND DEVELOPMENT

The numbers on our chart are not significant, other than showing that our trade deficit this year is about twice as high as in previous years. Looking into what we as an industry can do to improve our country's international situation, the strength of our dollar, our employment situation, and our sales posture, we have debated a number of issues.

For example, the first item on the lower portion of our chart. Would an attempt to decrease imports be of any major significance? The answers come up no. Why?

The American industrial manufacturing cycle is premised on acquiring the raw resoruces from the most economic area in the world, which is frequently exterior to the United States, and, therefore, we have an imported raw material.

[HG00A4][GDrive]

Generally, the manufacturing occurs at the most economic location to make the least expensive produce to fit the market need.

And, finally, the distribution and marketing system is set up to sell the products in areas where the greatest return can be obtained over the shortest timespan. Frequently this turns out to be in the U.S. domestic market; therefore, a manufacturing cycle is basically in tune with the American domestic needs which are either real or developed.

Further, our Government has taken an international posture at this time of negotiating in seeking to develop agreements with nations rich in raw resources to facilitate the purchase and interchange of—transportation of—these raw goods with a minimum of duties and tariffs.

If the United States takes a posture of decreasing its imports, it could expect to defeat the purpose of this round of negotiations and cause a counterround of increases in tariffs. Therefore, the logic of our governmental position abroad would be destroyed and ultimately our raw resources raised in price, so import reduction does not seem a feasible solution.

How about devaluing the dollar? The dollar has already been devalued several times and as such has become a highly competitive and useful commodity to U.S. industry in attempts to sell abroad.

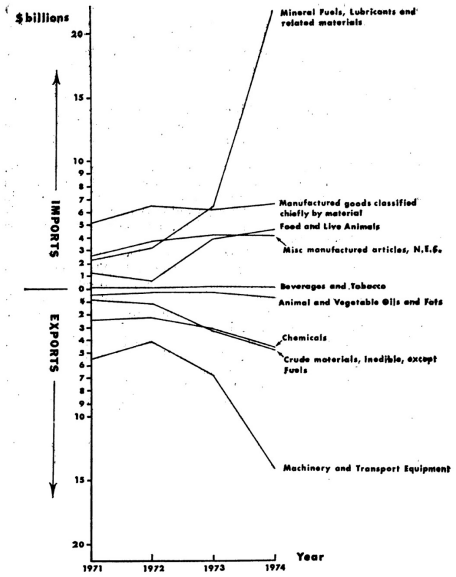
Actually, we are in a favorable position to compete abroad with our devalued dollar. The crux of the problem is to compete efficiently and with the proper mixture of U.S. Government support and associated banking, tax incentives, and other related operational data.

The next item: Reduce our standard of living. A look at the expansion of our energy needs and the statistics that tell us what the demand will be in the future for various forms of fuel and other raw resources, show that, given the American nature and its use of raw material, decreasing the standard of living is not a practical option.

Therefore, we must talk about increasing our exports as one of our more viable solution.

[HG00A5][GDrive]

[Slide 8 follows:]



When we look at this complicated chart, we can see that, from the zero point, the area above is imports and the area below is exports.

The two key swing factors are imports of energy and fuel-related materials and exports of machinery and transportation equipment. This latter is the major commodity area which enables us to offset partially our loss of dollars to the petromarket.

In the community area—machinery and transport equipment—we find aircraft and electronics. This indicates that one of our major,

[HG00A6][GDrive]

offset commodity areas contains the area of high technology and the manufacturing of sophisticated equipment such as electronics. We should be looking, then, for ways and means to efficiently promote and sell abroad to a higher degree to offset our loss in the area of fuels.

[Slide 9 follows:]

- **PROBLEM:**
  - TO GO FROM NEGATIVE TO POSITIVE TRADE BALANCE
- **FACTORS AFFECTING NEGATIVE TRADE BALANCE:**
  - ABSENCE OF STRONG FOCUSSED U.S. GOVERNMENT SUPPORT
  - STRONG OVERSEAS COMPETITION FROM INDUSTRIALIZED NATIONS (EEC AND JAPAN) (Export ratios from 9% to 25% of GNP)
  - U. S. TRADITIONALLY ORIENTED TO DOMESTIC TRADE (U. S. exports represent only 5% to 7% of GNP)
- **OBJECTIVE:**
  - INCREASE SHARE OF U. S. GNP GOING TO EXPORTS
- **PROGRAM TO ACHIEVE OBJECTIVE:**
  - DEVELOP COHERENT U. S. POLICY
  - MOTIVATE AND SUPPORT U. S. INDUSTRY IN OVERSEAS ACTIVITIES WITH STRONG EXPORT PROMOTION ACTIVITIES SUCH AS THOSE IN DEPARTMENT OF COMMERCE

When you interpret these factors, it becomes apparent that we are really talking about the problem of going from a negative trade balance to a positive trade balance, and the related advantages of a stronger dollar, a stronger government, stronger industry, and a busy, working population.

It is apparent to those in the export business that our Government is too fractured in its present policies toward export and international trade. When you compare the American industrial sales situation to that of its competitors abroad, there are several obvious characteristics.

There is a lack of focus of purpose between our banking, legislative, executive, and industry segments toward the prime goal of selling in foreign markets to support our national stature.

Our strongest industrial competition abroad has long since learned that they must export to survive, and we would find, if we looked at their gross national product, that from 9 to 25 percent of their GNP is directly related to export sales.

This simply isn't true in the United States, where the bulk of our sales have been in our domestic market. Even at this late date, we

[HG00A7][GDrive]

are only speaking to an order of 5 to 7 percent of our GNP as export related or dependent.

If the United States is going to survive in an international sense with a strong dollar base and a strong employment base, we have to work toward ways and means of expanding the percentage of our exports in our gross national product.

One of the very necessary objectives, then, is an agreed program to develop a more coherent U.S. policy to motivate and stimulate federally sponsored overseas activities such as those we now find in the Department of Commerce.

[Slide 10 follows:]

THE REAL WORLD OF EXPORTS
(U. S. $ billions)

	1973			1974		
	GNP	EXPORTS	EXPORTS AS % OF GNP	GNP	EXPORTS	EXPORTS AS % OF GNP
FED. REP. GERMANY	348.4	67.501	19.4	384.2	89.4	23.3
ITALY	135.0	22.3	16.2	143.5*	29.4*	20.5*

UNITED KINGDOM	168.0	28.017	16.6	160.0*	36.2*	22.6*
JAPAN	419.5	36.915	8.8	457.6	54.5	11.9
UNITED STATES	1,249.9	71.153	5.7	1,397.3	99.772	7.1

*Estimate

SOURCE: WORLD BANK

This chart was put together to show some relationships in the area of exports. The primary point that should be noted is the 5.7 percent for the United States versus the 19 percent for Germany as the export-related percentage of GNP, and also that last year we improved a small percentage.

One other factor that is corelated here is that actually the U.S. export abroad is one of high technology products. There is some confusion when you look at gross numbers like this, because there is an enormous interchange within the European economic community of agricultural products, and you are really talking about selling items across what might be considered the equivalent of a State border here in United States.

So there is some diffusion of relationships here, because we are not talking necessarily the same type of product exchange in these GNP export ratios.

[HG00A8][GDrive]

[Slide 11 follows:]

PROMOTIONAL EXPORT EXPENDITURES IN SUPPORT OF TRADE
(U. S. $ millions)

	1973	1974	% OF CHANGE 73 – 74
UNITED KINGDOM	70.8	84.0	+18.6
JAPAN	22.5	24.6	+ 9.3
FRANCE	11.2	12.8	+14.3
ITALY	36.6*	40.4*	+10.0
FED. REP. GERMANY	10.8*	12.0*	+11.0
UNITED STATES	17.0**	18.8**	+ 5.0

UNITED STATES

▲ *Ranks fourth in direct export promotional expenditures*

▲ *Lowest percentage increase from 1973 to 1974 of the above countries*

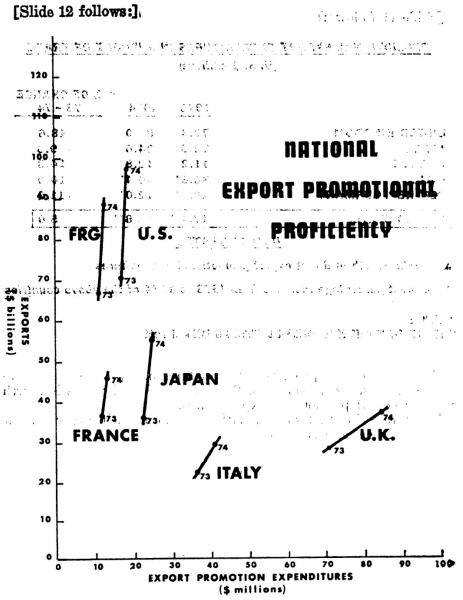
* ESTIMATE
** COMBINED EXPENDITURES OF INTERNATIONAL COMMERCE AND EAST-WEST TRADE

Turning to export promotional procedures in support of trade, we find an interesting relationship. We find the United States is fourth in direct export promotional expenditures.

It is interesting that smaller nations spend a much larger percent of money to get export sales.

[HG00A9][GDrive]

[Slide 12 follows:]



If we begin to think about who spends their funds more efficiently, we can see from this chart [slide 12] that the U.S. and Germany are two of the more efficient spenders of promotional dollars abroad. Again, each country goes about promotional activity in a different way so it is not possible to say that these comparative figures are of identical items of expenditure, but, roughly, these can be taken as relationships. However, it is quite clear from studying these numbers that the United Kingdom spent about $70 million to obtain an export sale of the order of about $28 billion, whereas the United States spent approximately $17 million and obtained a sale abroad of over $70 million.

[HG00AA][GDrive]

Clearly, then, investment in export promotional activity has a potential payoff for the United States in the sale of high technology-type products abroad. Our industrial competition abroad approaches the market in a combined way that includes a national policy directed toward export sales packages for foreign sales promotion that include banking, Government support, and aggressive marketing by industry.

[Slide 13 follows:]

LEGISLATIVE ACTION REQUIRED

- DEVELOP WITH STATE AND COMMERCE DEPARTMENTS A NATIONAL POLICY IN SUPPORT OF INTERNATIONAL TRADE
- LEGISLATIVE STATEMENT OF NATIONAL POLICY IN SUPPORT OF INTERNATIONAL TRADE
- DIRECT STATE AND COMMERCE TO DEVISE AND IMPLEMENT PROGRAMS TO STIMULATE AND FOCUS U. S. SALES ABROAD
- REVIEW FINANCIAL ASSISTANCE TO SUPPORT SALES ABROAD:
  - Export-Import Bank
  - Tax Incentives
- REPLACE EXECUTIVE CUTS IN DEPARTMENT OF COMMERCE'S DIBA BUDGET

In order to more effectively compete and to better utilize our promotional activity, we should be increasing this kind of function in some logical program which is based on an agreed posture between the Department of State, the Department of Commerce, our legislature, industry, and the banking communities.

What is needed is a forthright statement of national policy in support of international trade.

We further urge that Congress take a leading role, particularly in the Commerce Committee, in stimulating and motivating the Department of Commerce toward implementing a more strident program in the area of U.S. sales abroad and related promotional activity.

There should be a coherent review of our banking support to ventures abroad, including a more targeted approach which offers banking and governmental sponsorship for selected sales of high technology products.

During the last year, we have observed the problems related to the extension of the legislation on the Export-Import Bank, which is a critical factor in many American sales.

We have also observed that there is a move toward questioning tax incentives and other methods of stimulating U.S. participation abroad.

53-231—75——6

[HG00AB][GDrive]

We encourage a more favorable attitude toward the extension of credit and tax incentives for those who are willing to venture further into the export business. What we are proposing to you is really a "band-aid" approach, in replacement of the budget item. We think that you should reinstate the moneys in the international marketing and promotional aspects of the Department of Commerce budget, but we also urge that your committee look further into export expansion activities.

The promotional activities that relate to this have been described in some of the Commerce inputs, and we would urge that the level be increased even further than that proposed in the present budget. We would welcome the opportunity to work with members of your subcommittee staff in the development of an improved national policy towards export trade.

We are interested in providing what expertise and experience we have in these areas toward improvement of our country's general situation. We feel that by working as a team, we can perhaps improve our national posture, we can improve our sales, we can improve our trade balance, strengthen our dollar, and in general work toward the overall improvement of our total national management.

Senator INOUYE. Thank you very much, Mr. Edgington. Without objection, your slides will be made part of the record at the appropriate places.

In your statement, you mentioned the loss of $2 billion in exports resulting from cutbacks. Can you explain how you arrived at this figure?

Mr. EDGINGTON. Yes. Please show those two related slides on cutbacks.

While he's looking for the slides, the answer is that we look back at our prior experience in trade fairs, trade shows, and then how long it took us to acquire the sales that might come from those contacts we made, and we then interpolated about a year hence, what they might be.

We converted leads to sales using a ratio that we have experienced in past commitments at these kinds of shows.

Senator INOUYE. It's been suggested that our Government has been responsible for placing large numbers of obstacles in the path of businessmen who are trying to get into export trade business. Do you find this to be true?

Mr. EDGINGTON. I would like to provide you a written answer from the trade association, and I will personally answer you on your question.

I have only been doing this about 4 years, and I began my penetration efforts working through the Department of Commerce, and went on trade missions and so forth.

I learned a great deal from that. And I found the introductions were excellent. And there are problems in every business. You could call them obstacles, or you could call them challenges, or opportunities.

What we were urging was not a complaint type thing. We were urging something constructive, to put us together better.

[HG00AC][GDrive]

My experience was favorable, and I enjoyed the challenges, frankly.

[The following information was subsequently received for the record:]

In response to your question as to whether it was felt that our Government has been responsible for placing a large number of obstacles in the paths of businessmen who are trying to get into export trade business, it is our view that in terms of the total competitive aspects of making export sales, excessive time delays encountered by industry in the process of obtaining Department of Commerce and Department of State export licenses must be recognized as one of the major obstacles to be dealt with. The International Business Council of EIA has recently drawn up a position paper on the subject of Export Controls which is submitted herewith for the record.

EIA POSITION ON U.S. EXPORT CONTROLS

There has been increasing attention devoted to the export of technological equipment and systems to non-market economy nations. One of the reasons for this attention is the concern of some that the sale of electronics and other "technology" equipment and components to non-market economy nations may enhance those nations' capabilities, to the detriment of U.S. security. The U.S. government controls exports to non-market and other nations through licensing mechanisms. The mechanisms are often generalized and called "export controls". The administration of export controls has itself created a problem for exporters of electronic and telecommunications equipment and components because of uneven application of those controls, the length of time required for processing a license, a confusion between national interest and national security, and a number of other considerations. It is the contention of many involved in the export of electronics and telecommunications equipment that U.S. export control policy has made U.S. exports non-competitive as compared with those of our western trading partners and others. The position stated below is an attempt to spell out specific matters of concern with regard to U.S. export controls, and to make suggestions to simplify and to better administer those controls.

Electronic Industries Association, while recognizing the national security implications of the export of technology products and systems, equally recognizes that a strong export effort in the area of electronic and telecommunications equipment and components would greatly aid the U.S. balance of payments, create jobs for U.S. workers, improve working relations with foreign countries, and serve to strengthen the U.S. electronics manufacturing industry. To that end, the EIA urgently recommends the below listed points be encompassed within a move by the executive and legislative branches of U.S. government to simplify and to ease U.S. export control regulations.

Restructure the existing ponderous multi-agency organization involved in the administration of export controls to provide for greater centralization of authority and more efficient and timely exercise of that authority.

Provide a mechanism within the export control function for the issuance of timely and meaningful advance guidance to U.S. industry on proposed business opportunities with restricted trade areas.

Revalue the export control criteria to give realistic weight to the proven third (3rd) country availability of identical or equivalent products and/or technology.

Give due emphasis to recommendations of the officially constituted Government-Industry Technical Advisory Committee in order to properly reduce U.S. export controls to that level imposed by other industrialized COCOM member countries as directed by the Export Administration Act of 1949, as Amended.

Institute a Government-Industry review of all government required forms and reports associated with the export of goods and technology with the objective of realizing cost savings and greater efficiency through the elimination, consolidation or simplification of these requirements.

Reduce the supporting data requirements for export license application to that which is truly required to permit a valid determination. Where additional data are required for adjudication of an application the submitting organization should be promptly notified.

[HG00AD][GDrive]

Reject non-germane considerations in the issuing of export licenses and in the processing of licensing applications. United States export policy should be consistent with national security requirements, but should not be influenced by personal preferences or by myriad other factors which are not necessarily related to or consistent with the legislative basis of the export controls.

Senator INOUYE. In recent months, have you experienced intensified competition from foreign competitors?

Mr. EDGINGTON. Yes, significantly.

Senator INOUYE. Would you say that these competitors were being actively assisted by their countries?

Mr. EDGINGTON. Certainly. If you had attended the São Paulo Air Show, for example, as you traveled to Brazil and Venezuela, large potential market areas, you would find that the French, the Germans, and the United Kingdom had large missions which were sponsored by their embassies, by their equivalent of our Department of State.

These missions are accompanied by large groups of bankers, and when you meet that package, you meet money, government support, and industry, and it's a total package. As compared to American industry, which is basically on its own with a sponsorship of the Departments of State and Commerce.

Senator INOUYE. Are there any foreign export expansion programs you would like to have this Government either imitate or study?

Mr. EDGINGTON. Well, as you probably know, one of the international events of the year is always the Paris Air Show, which is a biennial thing. And that's clearly an international success.

And there's a program at Commerce to bring foreign dignitaries, ambassadors, as well as leading manufacturers and buying people, for what are called targeted opportunities, at shows in this country.

Actually, it's a little difficult to find carefully orchestrated shows in this country to which you can bring foreign buyers. The opportunity is there, but we have not developed the proper exposure vehicle in our own country.

Senator INOUYE. In slide No. 7, you mentioned the loss of $530 million. How did you arrive at that figure, sir?

Mr. EDGINGTON. That in turn follows back up to an item above it, which has to do with 85,000 leads and we have taken our typical conversion of leads to sales and contract awards.

You will notice that behind that slide there is a backup slide which relates to subtlements that cumulate up.

Senator INOUYE. Were you or your association called upon by OMB for advice and counsel on this matter?

Mr. EDGINGTON. I am an industry chairman in the Government Products Division, and I am not totally exposed to everything within the association. But, to my knowledge within our division, we were never solicited for advise or counsel on this matter.

SENATOR INOUYE. I have a few questions I'd like to submit to you. They may require a few statistics. If you could respond to them, I'd appreciate it very much.

Mr. EDGINGTON. We'd be pleased to. Thank you.

Senator INOUYE. Thank you very much.

[HG00AE][GDrive]

[The questions and answers follow:]

QUESTIONS OF SENATOR INOUYE AND THE ANSWERS THERETO

Question. The Electronics Industries Association is composed of some large multinational companies which theoretically would not have been seriously affected by the full cost recovery schedules because they could either absorb the costs or could abandon the Commerce programs for outside, private services. However, according to your analysis, the full cost recovery requirement might not only have that effect but also undermine the overall U.S. export effort by weakening all programs which require a good mix of new and established exporters to be effective. Is this a fair summary of your association's position?

Answer. Yes Sir, I believe that is a fair summary of the position of the GPD of EIA. If the established exporter opts not to participate some of the attractiveness of the promotion programs for the "new to market" companies would be diminished.

Question. Although your association opposes full cost recovery for established exporters, would it oppose raising participation fees for certain experienced exporters which have the ability to pay more? If this would be acceptable, at what level would you suggest setting the fees and how would the level be determined?

Answer. As we said in our basic statement, we feel that systems that have developed through our tax support and which we feel will contribute to increases in government revenues through increased tax returns from increased export business should continue as they are. We do not feel that a discriminatory fee schedule would enhance the program in any way.

Question. You have generally endorsed a strong export drive as being in the national interest. In doing so, however, would you agree that there is an optimal level beyond which it is uneconomic and not in the national interest to export?

If the answer is yes, how would you formulate our export goals to exploit fully our comparative advantage without making such exports economically unsound?

Answer. There is in all probability an optimum export level beyond which a number of market factors would make it increasingly uneconomic or unwise to continue. However, in our studies it does not appear that our high technology industries are anywhere near this level at present. While there are debatable factors that would influence the introduction or the increase of sales of some products in the export markets these we believe should be considered on an individual basis within a generally supportive export program. Our group has not attempted to formulate goals that would define the upper limit of an economically sound export program. We feel that this should be a subject for review by whatever group, as we recommend in our basic statement, is established to develop a coordinated national policy on export trade. We, of course, would be pleased to provide members or inputs to such a government sponsored group.

Question. On page 6 of your statement, you state that our current governmental efforts are too fractured and unfocused. Some people have suggested that one way to improve this fragmentation and lack of clarity is to improve government organization, possibly through the creation of a new department of international reforms. Would you care to comment on this suggestion?

Answer. We have not given any consideration to this proposal in our deliberations on the subject of export promotion. Our experience with existing organizational structures has been satisfactory in most respects and the main thrust of our basic position is that present systems should continue to be funded at the level required to provide the necessary services. The creation of new organizational structure or modification of existing structures would be among the subjects that might be addressed by a committee investigating development of a cohesive national export policy.

Question. You point out in your statement that one of the areas in which the U.S. maintains a competitive edge is in the high technology field. What further governmental actions do you think are needed to protect this lead—if any?

[HG00AF][GDrive]

Answer. Certainly, continued support for our export promotion program is required. Additionally, as we recommended in our basic statement, a forthright statement of national policy in support of international trade is required, supported by a logically developed program that has the support of the executive, legislative, industrial and banking segments of the nation.

Question. Does the Department of Commerce and State offer some unique services which could not and are not duplicated within the private sector and thus are complementary to rather than competitive with private programs?

Answer. Yes. The entree provided by representatives of the U.S. Government to representatives of industry in making initial contact with the proper persons in foreign governments and in foreign industries cannot be duplicated by the private sectors. Our State and Commerce experts who have devoted their career to the detailed study of certain areas and aspects of international relations are not duplicatable in the private sector. Finally, the prestige of the U.S. Government accretes to those groups, industrial and others, who appear in the foreign market areas with the support of appropriate organizations of that government. This too is an unduplicatable asset.

Senator INOUYE. Our next witness is Mr. Harry Browne for the National Association of Export Management.

Welcome, sir.

STATEMENT OF HARRY BROWNE, DIRECTOR, NATIONAL ASSOCIATION OF EXPORT MANAGEMENT COMPANIES OF NEW YORK; AND CHAIRMAN OF THE NATIONAL FEDERATION OF EXPORT MANAGEMENT COMPANIES OF WASHINGTON, D.C.

Mr. BROWNE. My name is Harry Browne, I am a director of the National Association of Export Management Co. of New York, and chairman of PEMCO, the National Federation of EMCs of Washington, D.C.

Export Management Co., EMCs, as they are also known, are independent trading companies, generally small to medium-sized, that represent U.S. manufacturers overseas, promoting the sales of a variety of manufactured products as well as of raw materials all over the globe.

We count close to a thousand professional EMCs in the United States, mostly acting as principals, i.e., buying and selling for their own account. They export about $8 billion worth of goods annually, say 8 per cent of the Nation's total exports, but a much larger percentage when manufactured goods only are considered, i.e., after exclusion of agricultural and arms sales.

Being in the "foreign trade firing line" on a daily basis, we recognize the need to export as part of our life's doctrine. We feel that way, however, not only because it happens to be our bread and butter, but because we firmly believe that exports are absolutely and vitally essential for a stable dollar and a stable economy of the United States.

In the light of the potential imbalance of our exchange flow as a result of the well-known petroleum cost picture, we feel that a continuing strengthening of our foreign trade and a solid measure of continuing increase in our Nation's overall exports is more essential than ever.

In the light of this need—which we regard as critical—we are now faced with a recommendation from the Office of Management

LETTER OF TRANSMITTAL

U.S. HOUSE OF REPRESENTATIVES,
COMMITTEE ON ARMED SERVICES,
Washington, D.C.

HON. MELVIN PRICE,
Chairman, Committee on Armed Services,
House of Representatives,
Washington, D.C.

DEAR CHAIRMAN PRICE: Attached is the report of the Special Subcommittee on NATO Standardization, Interoperability and Readiness.

The special subcommittee conducted a comprehensive study of standardization, interoperability and readiness holding 26 hearings and 15 briefings. Additionally, a delegation from the special subcommittee visited five European NATO countries from July 3 to July 7, 1978.

The work which the special subcommittee performed was always directed by the guiding principle of identifying facts and eliminating vagaries. Accordingly, this report presents the facts contained in our record of the NATO initiatives currently being considered.

With kind regards and best wishes,

Very sincerely,

DAN DANIEL,
Chairman, Special Subcommittee on NATO Standardization, Interoperability and Readiness.

Approved for printing
Melvin Price, *Chairman*

[HG00AQ][GDrive]

FINDINGS AND CONCLUSIONS

STANDARDIZATION, INTEROPERABILITY AND ARMS COOPERATION

1. The Department of Defense is unable to define clearly many of the terms it uses to explain standardization and interoperability concepts.

Standardization and interoperability have ambiguous definitions. These definitions have produced confusing and often conflicting guidance for translating policy into action. Rationalization is an incomprehensible term.

2. The basic rationale for arms cooperation is that it will reduce duplication and increase efficiency of defense expenditures. There are only vague estimates that support such a conclusion, while data derived from actual case experience seems to contradict it.

3. It is unlikely there will be significant cost savings realized from arms cooperation. Approximately $3 billion annually is available as *potential* savings if *all* duplication of effort is eliminated. This is less than two percent of the current alliance budgets. Thus cooperation while it does allow some potential savings, is certainly not the total answer to NATO's problems.

4. The potential savings are purely theoretical. No witness who appeared before the subcommittee suggested there would be any immediate savings as a result of arms cooperation. It is impossible to predict accurately whether cooperation will save or cost money, either in the near future or in the long run.

5. The "Culver-Nunn" Amendment to the Defense Appropriation Authorization Act of 1977 is subject to confusing interpretation by some in the Department of Defense, and that which is not understood cannot be implemented.

6. Arms cooperation as a concept does not necessarily imply that the policy of standardization and interoperability as passed in the "Culver-Nunn" amendment would be most effectively implemented.

7. European defense industries are growing and represent an important investment on the part of their governments in financial resources, jobs and national pride. Their expanding capabilities and importance, therefore, influence government defense planning and procurement decisions.

As European defense products proliferate, the only conceivably efficient and equitable mechanism to provide the best defense will be to select equipment competitively. This approach is universally supported in principle but also nearly universally ignored in practice.

8. Memoranda of Understanding (MOU) are being used to document understandings between national defense officials. However, since MOU's are not formally approved by Congress, they represent understandings and nothing more. Congressional approval will not be achieved until enactment of appropriations or other implementing legislation.

[HG00AR][GDrive]

9. The Department of Defense does not have a single definition of the "two-way street."

There are two different ways to look at the present balance of trade on the "two-way street". The European approach is to limit the traffic count to arms trade which produces a balance heavily in favor of the United States. Using a broader definition of traffic that encompasses all defense-related goods and services produces a "two-way street" heavily balanced in Europe's favor.

10. The term "two-way street" as applied by Europeans and some U.S. defense officials is a political device to secure economic benefits for European industries and often has little or nothing to do with enhancing military effectiveness.

There is no compelling reason for acceptance of the narrow European definition of the "two-way street" and isolating the one segment of the transatlantic defense trade which produces a surplus for the United States. Nor does the subcommittee find any particular value in singling out defense trade as a special category of overall transatlantic trade.

However, European procurement of U.S. weapons systems is increasingly linked to the concept of a "two-way street" by insistence on reciprocal U.S. purchases to serve as economic offsets.

11. The Family of Weapons concept is formless and undefined. It is an approach to arms cooperation designed to eliminate competition by grouping "families" of weapons and dividing up the development work.

There is no consensus as to how the member nations would divide up the development responsibilities. And it is still to be demonstrated that NATO can eliminate competition without lowering technological standards.

12. Major segments of U.S. industry and labor are confused about the Department of Defense's concept of the Family of Weapons and arms cooperation. They, therefore, do not support this.

If some level of meaningful arms cooperation is to become a reality defense contractors and labor must be consulted and participate at an early stage in the process.

13. International arms cooperation encompasses political and economic considerations beyond the jurisdiction of the Department of Defense alone. Interagency coordination of procurement practices is the responsibility of the Office of Federal Procurement Policy. However, the Administrator for Federal Procurement Policy knows very little about programs which his office is supposed to coordinate.

NATO READINESS REQUIREMENTS AND INITIATIVES

1. NATO's present capability to conduct a successful conventional defense against an attack by the Warsaw Pact and to terminate such a conflict on terms favorable to NATO is extremely doubtful.

NATO's capability to fight a protracted war is almost nonexistent. NATO lacks the capability to fight for thirty days and present plans will not provide such a capability before 1983.

The European shortages of ammunition and replacement stocks are critical; evidence available to the subcommittee suggests that European forces will begin to run out of equipment and ammunition in a matter of days rather than weeks or months.

[HG00AS][GDrive]

2. The NATO goal of 3 percent annual real growth in defense spending was a compromise between military requirements and what was political practicability. This increase will not be sufficient to reverse the unfavorable trends in the NATO-Warsaw Pact conventional forces balance.

When the United States agreed to the goal of 3 percent annual real growth, it was understood that the increase applied to the entire defense budget.

The United States has not honored its commitment since President Carter agreed to it.

3. The NATO Long Term Defense Plan (LTDP) will have little impact on NATO readiness until the 1990's. As an exercise in data gathering and coordination, the LTDP is a laudable accomplishment. As a blueprint for the time-phased correction of NATO's difficulties, it is of questionable value because it cannot be translated into national procurement plans, country-by-country, year-by-year, and item-by-item.

The Short Term Initiatives approved by NATO Defense Ministers represent a positive, if not wholly adequate, step toward the correction of specific alliance deficiencies in the near to mid-term. The short term initiatives are specific country-by-country commitments.

LEGISLATIVE PROPOSALS

1. The subcommittee reviewed H.R. 11607, a proposal to waive existing law for the formation of agreements with North Atlantic Treaty Organization countries for host nation support. The goal of H.R. 11607 is worth pursuing. The proposal as submitted, though, is far too sweeping in authority and should be redrafted.

2. The subcommittee reviewed a second legislative proposal, H.R. 12837, that would empower the Secretary of Defense unilaterally to establish both procurement practices and procedures for international purchases of property and services. The subcommittee finds the intent of H.R. 12837 too broad to merit support.

[HG00AT][GDrive]

How do we divide up the responsibility?

Mr. OLIVER BOILEAU. (President, Boeing Aerospace Company. Called as a witness in his capacity of Vice Chairman, Defense Science Board, 1978 Summer Study.) I don't think that we could think that we could implement the family of weapons by splitting up the functional world saying, "You take the short-range missile—we will take the long-range missile." That is not going to work because people will see through the fact we are giving up the short-range, and every long-range missile sure as heck is going to work at short-range.[21]

Will it save any money?

Dr. FROST. With respect to R. & D. I think the amounts of money in the research phase would be so minimal as compared to procurement of the developed product that the amount involved won't be that relevant.[22]

Dr. PERRY. Dual production is the second leg of the competitive triad. When one nation has completed development of a system which is useful to the alliance, that nation should make its system available for production by other countries or consortia of countries. This will eliminate unnecessary duplication in R. & D. while avoiding the trade and labor imbalance that would result from exclusive development and sales.[23]

Dr. Frost says the real savings would come in procurement, not R & D, and Dr. Perry says each nation can produce the system domestically, so whatever savings there are would have to come from R & D. Based upon these two statements the tentative conclusion would be that the U.S. will save little or no money.

Will the elimination of international competition result in inferior weapons systems?

Mr. KARL HARR. (President, Aerospace Industries of America, Inc.) * * * if by going that route you remove substantial competition from the process, then you guarantee a lowering of the technological standard you are going to achieve.

* * * * * * * * * * * * * * * we are uncertain about the degree to which our Government appreciates what can be lost if they do not keep in mind those two principles I mentioned—preserving competitiveness and retaining high technology capability in this country.[24]

Do labor and industry understand and support the concept?

Mr. WALTER EDGINGTON. (Chairman of the Export-Import Committee of the Government Division of the Electronic Industries Association). The example used by the administration is an agreement with NATO for one country to be selected, presumably by NATO bureaucrats meeting secretly behind closed doors, to develop a certain type of antitank missile while another country will be selected to develop a complementary missile. This seems to fit what can be described as political horsetrading, or as Ambassador Komer also put it, dividing the pie reasonably.

One is left with the uneasy feeling that the whole process is a total change in concept to the traditional free enterprise process and one in which this country would be the loser.

Mr. Chairman, this is a concept which must be totally rejected by the Congress. To permit the executive branch to conclude such memorandums of understanding could have a devastating effect upon our balance of trade, our commercial export markets, and jobs here at home.[25]

Mr. OSWALD. (Spokesman for the AFL–CIO). That is not healthy because that really denies us the ability to develop our own expertise in that area. Our relationships are very important with NATO, but they are not our sole relations.[26]

APPENDIX B

WITNESSES AND CONTRIBUTORS

DEPARTMENT OF STATE

Hon. Warren Christopher, Under Secretary of State, Acting Secretary of State on October 10, 1978.
Hon. George S. Vest, Assistant Secretary of State for European Affairs.

DEPARTMENT OF DEFENSE

Hon. Harold Brown, Secretary of Defense.
Hon. William J. Perry, Under Secretary of Defense for Research and Engineering.
Hon. Robert W. Komer, Advisor to Secretary and Deputy Secretary on NATO Affairs.
Hon. Dale W. Church, Deputy Under Secretary of Defense, for Research and Engineering (Acquisition Policy).
Dr. Ellen L. Frost, Deputy Assistant Secretary for International Economic Affairs.
Maj. Gen. Richard C. Bowman, Director, European Region, Office of Assistant Secretary (International Security Affairs).
Mr. Peniel Moed, Office of Assistant General Counsel (Logistics).

OFFICE OF JOINT CHIEFS OF STAFF

Lt. Gen. A. W. Braswell, USAF, Director (J–5 Plans and Policy) Office of Joint Chiefs of Staff.
Lt. Gen. Arthur J. Gregg, Director for Logistics (J–4), Office of Joint Chiefs of Staff.
Rear Adm. Edward A. Burkhalter, Deputy Director for Operations (J–3), (Strategic and General Operations), Office of Joint Chiefs of Staff.
Col. W. D. Johnson, USA, European Division (J–5), Plans and Policy Directorate, Office of Joint Chiefs of Staff.
Lt. Col. Jim Blundell, USA, Office of Joint Chiefs of Staff.

U.S. EUROPEAN COMMAND

Lt. Gen. Rolland Heiser, USA (1 Jun 76), Chief of Staff, EUCOM.
Maj. Gen. Lincoln D. Faurer, USAF, Director, J–2.
Rear Adm. Eugene J. Carroll, USN, Director, J–3.
Maj. Gen. Edward A. Partain, USA, Director, J–4/7.
Maj. Gen. Richard B. Collins, USAF, Director, J–5.
Rear Adm. William Nivison, USN, Director, J–6.
Col. William E. Watts.
S/sg Robert R. Roth.

DEPARTMENT OF THE ARMY

Hon. Walter LaBerge, Under Secretary of the Army.
Hon. Percy A. Pierre, Assistant Secretary of the Army (Research, Development and Acquisition).
Lt. Gen. Edward C. Meyer, Deputy Chief of Staff for Operations and Plans.
Lt. Gen. Donald R. Keith, Deputy Chief of Staff for Research, Development and Acquisition.

[HG00AV][GDrive]

DEPARTMENT OF THE NAVY

Adm. Isaac C. Kidd, Jr., Commander-in-Chief, Atlantic and U.S. Atlantic Fleet.
Hon. David E. Mann, Assistant Secretary of the Navy, for Research, Development, Test and Evaluation.
Vice Adm. Parker B. Armstrong, Director, Research, Test and Evaluation.
Lt. Gen. Andrew W. O'Donnell, Deputy Chief of Staff for Plans and Policies, United States Marine Corps.
Vice Adm. William J. Crowe, Jr., Deputy Chief of Naval Operations, for Plans, Policy and Operations.

EUROPE—MILITARY

Gen. Alexander M. Haig, Jr., Commander in Chief, U.S. European Command.
Gen. Franz-Joseph Schulze, Commander in Chief, Allied Forces, Central Europe.
Gen. Herman Zeiner Gundersen, Chairman, Military Committee, NATO.
Vice Adm. Joseph P. Moorer, Commander in Chief, U.S. Naval Forces, Europe, and U.S. Commander, Eastern Atlantic.
Vice Adm. Sir James G. Jungius, SACLANT Representative, Europe.
Gen. George Blanchard, USA, Commander in Chief, U.S. Army Forces Europe.
Lt. Gen. John W. Pauly, USAF, Vice Commander in Chief, U.S. Air Force Europe.

DEPARTMENT OF THE AIR FORCE

Hon. John J. Martin, Assistant Secretary of Air Force for Research, Development and Logistics.
Lt. Gen. H. M. Fish, Assistant Vice Chief of Staff, USAF.
Maj. Gen. T. I. Ahern, Assistant Deputy Chief of Staff (Research and Development).
Dr. Wallace C. Magathan, Jr., Defense Intelligence Office, Defense Intelligence Agency.
Lt. Col. Frederick Walker, Senior Military Analyst, Soviet Warsaw Pact Area, Defense Intelligence Agency.

DEPARTMENT OF COMMERCE

Mr. William A. Cox, Deputy Chief Economist.

OFFICE OF MANAGEMENT AND BUDGET

Hon. Lester A. Fettig, Administrator, Office of Federal Procurement Policy, Office of Management and Budget.

EUROPE—POLITICAL

France
Mr. Masson, Director of the Minister's Defense Cabinet.
Mr. Hibon, Deputy Director of the General Delegation for Armaments International Affairs.
Mr. Mournier, Assistant Director of the General Delegation of Armaments/Corporation.

Federal Republic of Germany
Dr. Karl Schnell, State Secretary for Armament Affairs.
Mr. Hans Eberhart, Director of Armaments.
Mr. Carl Damm, Member of Bundestag, Defense Committee.

Netherlands
Dr. William F. van Eekelen, State Secretary for Defense (Materiel).
Mr. Ad Ploeg, Vice Chairman of the Committee for Defense of the Second Chamber of the Netherlands Parliament.
Mr. W. A. M. Mells, Commissioner for Military Production, Ministry of Economic Affairs.

United Kingdom
Dr. John Gilbert, M. P., Minister of State for Defense.
Sir Clifford Cornford, Chief of Defense Procurement.

[HG00AW][GDrive]

U.S. Representatives
Hon. Arthur A. Hartman, U.S. Ambassador to France.
Hon. W. Tapley Bennett, U.S. Ambassador to NATO.

EUROPE—INDUSTRIAL

France
Mr. Cauvin, President, Thompson CSF.
Mr. Ravaud, President et Secretaire General, SNECMA.

United Kingdom
Sir Peter Matthews, Managing Director and Chief Executive, Vickers Limited and Chairman of the Defence Industries Council.
The Rt. Hon. The Lord Beswick, P.C., Chairman, British Aerospace.
Admiral Sir Anthony Griffin, Chairman, British Shipbuilders.
Mr. R. F. Hunt, Chairman & Chief Executive, Dowth Group Limited, and Deputy President, Society of British Aerospace Companies.
Mr. R. H. Newham, Director, E.M.I. Limited; Deputy President, Electronic Engineering Association; and Head of U.K. Delegation to the NATO Industrial Advisory Group.
Mr. E. R. Sisson, Chairman Smiths Industries Limited and Treasurer, Society of British Aerospace Companies.
Marshal of the RAF Sir Denis Spotswood, Vice Chairman, Rolls Royce Limited and President, Society of British Aerospace Companies.
Sir Richard Smeeton, Secretary of the Defence Industries Council and Director, Society of British Aerospace Companies.
Sir Robert Telford, Managing Director, GEC–Marconi Electronics Limited.

OUTSIDE WITNESSES

Hon. Andrew J. Biemiller, Director, Department of Legislation, AFL–CIO.
Mr. Oliver Boileau, President, Boeing Aerospace Co.
Mr. Thomas Callaghan Jr., Director, Allied Interdependence Project, Center for Strategic and International Studies, Georgetown University.
Mr. Walter R. Edgington, Vice President and Chairman of Export/Import Committee of Government Division of Electronic Industries Association (EIA).
Mr. David J. Fitzmaurice, President, International Union of Electrical, Radio and Machine Workers.
Mr. Karl G. Harr, President, Aerospace Industries Association of America, Inc.
Dr. Helen M. Kramer, Assistant to the Director of International Affairs Department, International Association of Machinists and Aerospace Workers.
Dr. Mordechai E. Kreinin, Professor of Economics, Michigan State University.
Mr. David A. Leff, Executive Director, Joint Maritime Congress.
Mr. Walter B. O'Neil, Vice Chairman, Export/Import Committee of Electronic Industries Association.
Dr. Roger Shields, Vice President, International Unit of Economic Research Department, Chemical Bank of New York.
Mr. Robert B. Wood, Director of Research and Education Department, International Brotherhood of Electrical Workers.

Preface

On 25-27 June 1979, a Seminar on US-Italian Armaments Cooperation was conducted in Washington, DC, to inform industry of Government policies and procedures and to facilitate direct contact between Italian and US industry. The seminar was attended by approximately 100 executives from industry from the two countries, plus key officials from both governments including National Armaments Directors General Fabio Moizo and Dr. William J. Perry.

On 11 September 1978 Italian Minister of Defense Attilio Ruffini and US Secretary of Defense Harold Brown signed the Memorandum of Understanding between the Government of Italy and the United States of America concerning the Principles Governing Mutual Cooperation in the Research, Development Production and Procurement of Defense Equipment. The preamble of this MOU states that both parties agree to seek increased combat effectiveness for its military forces and reduced redundancy of research and development resources. In pursuit of those goals both parties agreed to waive, on a reciprocal basis, "buy national" penalties tariff duties and other obstacles to cooperation. The MOU further states that it is the responsibility of Government to inform industry of its policies and procedures and the responsibility of industry to pursue business opportunities.

The key Italian officials responsible for planning and organizing the seminar were MGEN Giorgio Santucci, Sig Marcello Serafini, Sig Luigi Costa Sanseverino and LTC Pietro Moja of the Embassy in Washington, DC.

Principal US officials who planned and organized the seminar were Colonels Charles W. Richardson, Jr. and Norman Walker, LtCol A. Lee Tessmer, Mr. William Levitt, and Mr. Marvin Stearn. These Proceedings were prepared by Colonel Richardson and Lieutenant Michael Foley, USMC.

APPENDIX C

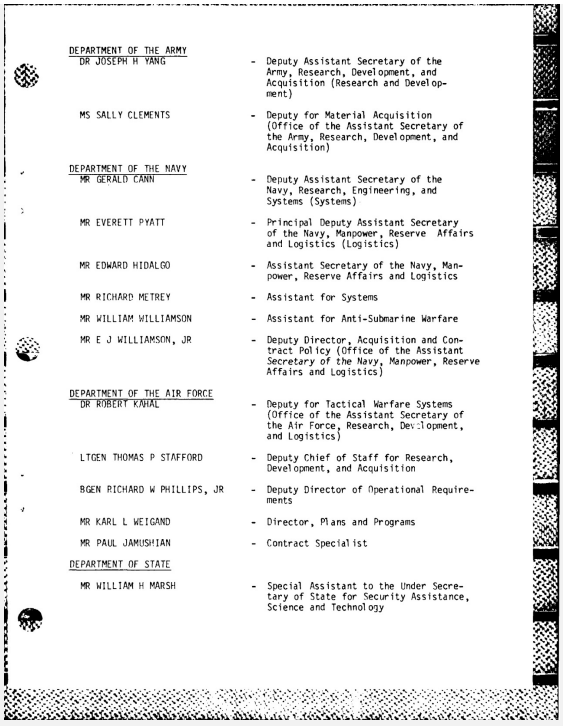
PARTICIPANTS

GOVERNMENT OF THE UNITED STATES

DEPARTMENT OF DEFENSE

DR WILLIAM J PERRY	-	Under Secretary of Defense for Research and Engineering
MR DALE W CHURCH	-	Deputy Under Secretary of Defense, Research and Engineering (Acquisition Policy)
DR VITALIJ GARBER	-	Director, International Programs (Office of the Under Secretary of Defense for Research and Engineering)
MR JAMES V SIENA	-	Deputy Assistant Secretary of Defense, International Security Affairs (European and NATO Affairs)
DR ELLEN L FROST	-	Deputy Assistant Secretary of Defense, International Security Affairs (International Economic Affairs)
MGEN RICHARD C BOWMAN	-	Director, European and NATO Affairs (Office of the Assistant Secretary of Defense for International Security Affairs)
MR WILLIAM LEVITT	-	Special Assistant for Acquisition (Office of the Deputy Under Secretary of Defense for Research and Engineering - Acquisition Policy)
MR JERRY SULLIVAN	-	Staff Assistant, International Programs (Office of the Under Secretary of Defense for Research and Engineering)
COL NORMAN B WALKER	-	Office of the Assistant Secretary of Defense for International Security Affairs (European and NATO Affairs)
COL CHARLES W RICHARDSON, JR	-	Office of the Under Secretary of Defense for International Security Affairs (European and NATO Affairs)
MR EMILIO G TAVERNISE	-	Office of the Assistant Secretary of Defense for Research and Engineering (International Programs)

[HI001Z][GDrive]



DEPARTMENT OF THE ARMY

DR JOSEPH H YANG	-	Deputy Assistant Secretary of the Army, Research, Development, and Acquisition (Research and Development)
MS SALLY CLEMENTS	-	Deputy for Material Acquisition (Office of the Assistant Secretary of the Army, Research, Development, and Acquisition)

DEPARTMENT OF THE NAVY

MR GERALD CANN	-	Deputy Assistant Secretary of the Navy, Research, Engineering, and Systems (Systems)
MR EVERETT PYATT	-	Principal Deputy Assistant Secretary of the Navy, Manpower, Reserve Affairs and Logistics (Logistics)
MR EDWARD HIDALGO	-	Assistant Secretary of the Navy, Manpower, Reserve Affairs and Logistics
MR RICHARD METREY	-	Assistant for Systems
MR WILLIAM WILLIAMSON	-	Assistant for Anti-Submarine Warfare
MR E J WILLIAMSON, JR	-	Deputy Director, Acquisition and Contract Policy (Office of the Assistant Secretary of the Navy, Manpower, Reserve Affairs and Logistics)

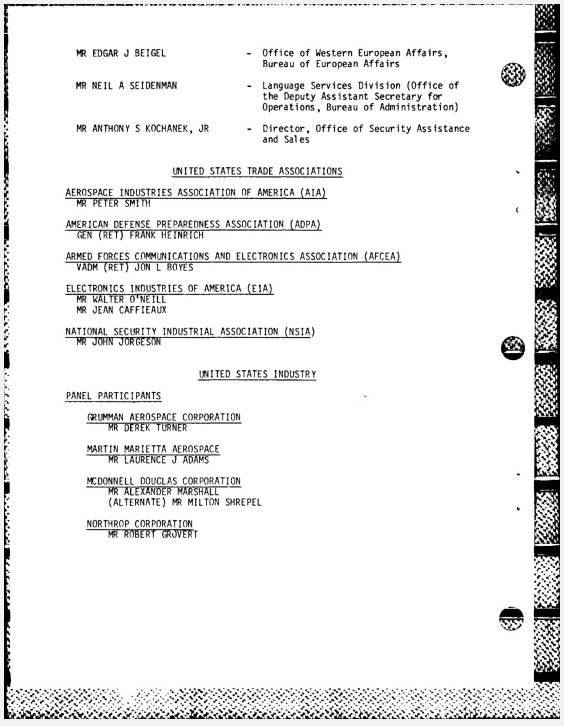
DEPARTMENT OF THE AIR FORCE

DR ROBERT KAHAL	-	Deputy for Tactical Warfare Systems (Office of the Assistant Secretary of the Air Force, Research, Development, and Logistics)
LTGEN THOMAS P STAFFORD	-	Deputy Chief of Staff for Research, Development, and Acquisition
BGEN RICHARD W PHILLIPS, JR	-	Deputy Director of Operational Requirements
MR KARL L WEIGAND	-	Director, Plans and Programs
MR PAUL JAMUSHIAN	-	Contract Specialist

DEPARTMENT OF STATE

MR WILLIAM H MARSH	-	Special Assistant to the Under Secretary of State for Security Assistance, Science and Technology

[HI0020][GDrive]



MR EDGAR J BEIGEL	-	Office of Western European Affairs, Bureau of European Affairs
MR NEIL A SEIDENMAN	-	Language Services Division (Office of the Deputy Assistant Secretary for Operations, Bureau of Administration)
MR ANTHONY S KOCHANEK, JR	-	Director, Office of Security Assistance and Sales

STATEMENT OF WALTER R. EDGINGTON, INTERNATIONAL COMMITTEE, NATIONAL SECURITY INDUSTRIAL ASSOCIATION

The CHAIRMAN. Mr. Edgington.

Mr. EDGINGTON. Mr. Chairman, I am Walter Edgington. I am here today as the chairman of the National Security Industrial Association [NSIA], which is a nonprofit, nonpolitical, and nonlobbying association of approximately 300 manufacturing, research, engineering, educational, and service organizations.

At the outset, let me state that NSIA supports the current policy in the new conventional arms transfer both in objectives and in approach.

We welcome this latest assessment of the world as it exists today and the steps to be taken to restore America's leadership role. The enhancemnt of the state of readiness of our friends and allies, the revitalization of our alliances, the establishment of more coherent East-West policies and strategies, the reinvigoration and strengthening of our own defense production capabilities all are realistic objectives which we can achieve and whose achievement will contribute to the security of the world.

We in industry are regularly involved with multiple European and Canadian corporations in various business opportunities, joint ventures, licenses, and marketing activity. Because of this close association, our constant interchange, travel, and intergovernment relationship, we too are very anxious about major international tensions both in Europe and the Middle East.

In Europe, the North Atlantic Treaty Organization is our major alliance, and within the North American military industrial community NATO clearly provides the framework for discussion of many common needs. Economic bases, employment, multinational projects, military sales, arms transfers, export licenses, and Third World nations as markets have become our buzz words.

During the last few years, though, the nations, their national industrial bases, their political parties, NATO and the EEC, have been in a constant ferment. The gradual erosion of our military strength, the significance of our national industrial bases, the growing pressure of various forms of social democratic concepts, and the focus on materialism are apparent.

NATO governments are anxious to increase exports, pressing their industries for international sales, both military and commercial, in all the world's marketplaces—their objective being to develop and maintain a strong industrial base, strong employment, strong currency, and to insure major offsets to the energy costs.

It is against this background that U.S. industry and our Government must combine to strengthen our will, our purpose, our management, our productivity, and our talents both at home, within the NATO alliance, and competitively in the Third World markets.

The NSIA concurs in this point of judicious use of arms transfer and a flexible, pragmatic approach to arms sales which can strengthen the U.S. economy and industrial base and contribute to the resolution of some of the economic problems of our allies and friends and enhance deterrence.

88

Last year I appeared before this committee to give an industry view of the status of Mr. Carter's arms transfer policy and its direct impact upon the U.S. exporting business opportunities and employment in this country. I sought to clarify or place in perspective the military, political, and economic advantages which accrue to the Government. These advantages still hold true and, in fact, are even more important today as this country seeks to improve its industrial base and strengthen and maintain international peace and security.

From an industry standpoint, the sale of military products contributes to a higher employment at home; maintenance of a secure industrial base: an improved balance of payments; added profits for capital formation and, hence, technology and productivity investment; potentially lower unit costs for DOD; and the much enhanced opportunity to expand our commercial activities with those countries purchasing defense items and services to include logistics and support.

There are also pluses for American foreign policy goals as well, such as reassertion of America's predominant position as guardian of the democratic values, a reduction in the need for direct U.S. military involvement, and, in many cases, increased political influence in those countries receiving equipment. Many of last year's key points, were addressed in today's statement.

From an industry viewpoint, we would usually prefer commercial sales over military sales because they are quicker, simpler, and provide for more direct contact with the foreign buyer who may have additional needs not always recognizable when dealing through a third party. Industry experience is that the U.S. Government management controls over commercial arms sales are equally as stringent as in the case of foreign military sales. Therefore, it seems advantageous to permit each sovereign country to choose whether it desires to acquire goods and services through foreign military sales or via commercial sales.

We are pleased to see that the current arms transfer policy has, in essence, responded to our recommendations or acknowledged the basic issues of concern to us, such as co-production agreements and third-country transfers with pledges to study the issues and to consult with Members of Congress, industry, and others to seek guidelines for the future.

We welcome the opportunity to work with Government in this vital area of security and offer at this time the following recommendations and comments:

Regarding co-production, future co-production agreements, be they with our NATO allies or other friendly nations, should be supported by the Government, but details of the actual agreements should be left to the companies actually involved.

Regarding third-country sales, the related issue of third-country sales should be worked out by the companies involved in their sales co-production agreements in conformance with existing laws and controls. Obviously, there will be a particular constraint to prevent any East-West loss of technology. I would emphasize that U.S. corporations are highly sensitive to the national security problems and all aspects thereof.

Regarding the commercial ceiling, there is no apparent advantage to retaining the commercial ceiling. Our experience in the last admin-

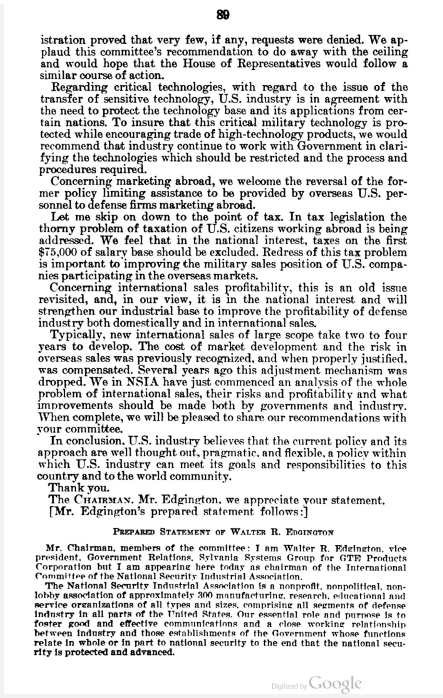
[HG009P][GDrive]



89

istration proved that very few, if any, requests were denied. We applaud this committee's recommendation to do away with the ceiling and would hope that the House of Representatives would follow a similar course of action.

Regarding critical technologies, with regard to the issue of the transfer of sensitive technology, U.S. industry is in agreement with the need to protect the technology base and its applications from certain nations. To insure that this critical military technology is protected while encouraging trade of high-technology products, we would recommend that industry continue to work with Government in clarifying the technologies which should be restricted and the process and procedures required.

Concerning marketing abroad, we welcome the reversal of the former policy limiting assistance to be provided by overseas U.S. personnel to defense firms marketing abroad.

Let me skip on down to the point of tax. In tax legislation the thorny problem of taxation of U.S. citizens working abroad is being addressed. We feel that in the national interest, taxes on the first $75,000 of salary base should be excluded. Redress of this tax problem is important to improving the military sales position of U.S. companies participating in the overseas markets.

Concerning international sales profitability, this is an old issue revisited, and, in our view, it is in the national interest and will strengthen our industrial base to improve the profitability of defense industry both domestically and in international sales.

Typically, new international sales of large scope take two to four years to develop. The cost of market development and the risk in overseas sales was previously recognized, and when properly justified, was compensated. Several years ago this adjustment mechanism was dropped. We in NSIA have just commenced an analysis of the whole problem of international sales, their risks and profitability and what improvements should be made both by governments and industry. When complete, we will be pleased to share our recommendations with your committee.

In conclusion, U.S. industry believes that the current policy and its approach are well thought out, pragmatic, and flexible, a policy within which U.S. industry can meet its goals and responsibilities to this country and to the world community.

Thank you.

The CHAIRMAN. Mr. Edgington, we appreciate your statement.

[Mr. Edgington's prepared statement follows:]

PREPARED STATEMENT OF WALTER R. EDGINGTON

Mr. Chairman, members of the committee: I am Walter R. Edgington, vice president, Government Relations, Sylvania Systems Group for GTE Products Corporation but I am appearing here today as chairman of the International Committee of the National Security Industrial Association.

The National Security Industrial Association is a nonprofit, nonpolitical, nonlobby association of approximately 300 manufacturing, research, educational and service organizations of all types and sizes, comprising all segments of defense industry in all parts of the United States. Our essential role and purpose is to foster good and effective communications and a close working relationship between industry and those establishments of the Government whose functions relate in whole or in part to national security to the end that the national security is protected and advanced.

Let me skip on down to the point of tax. In tax legislation the thorny problem of taxation of U.S. citizens working abroad is being addressed. We feel that in the national interest, taxes on the first $i5,000 of salary base should be excluded. Redress of this tax problem is important to improving the military sales position of U.S. companies participating in the overseas markets.

Concerning international sales profitability, this is an old issue revisited, and, in our view, it is m the national interest and will strengthen our industrial base to improve the profitability of defense industry both domestically and in international sales.

Typically, new international sales of large scope take two to four years to develop. The cost of market development and the risk in overseas sales was previously recognized, and when properly justified. was compensated. Several years ago this adjustment mechanism was dropped. We in NSIA have just commenced an analysis of the whole problem of international sales, their risks and profitability and what improvements should be made both by governments and industry. "When complete, we will be pleased to share our recommendations with your committee.

In conclusion. U.S. industry believes that the current policy and its approach are well thought out, pragmatic. and flexible. a policy within which U.S. industry can meet its goals and responsibilities to this country and to the world community.

Thank you.

The CHAIRMAN, Mr. Edgington. we appreciate your statement.

[Mr. Edgington's prepared statement follows:]

PREPARED STATEMENT OF WALTER R. EDGINGTON

Mr. Chairman, members of the committee: I am Walter R. Edgington. vice president, Government Relations, Sylvania Systems Group for GTE Products Corporation but I am appearing here today as chairman of the International Committee of the National Security Industrial Association.

The National Security Industrial Association is a nonprofit. nonpolitical. non-lobby association of approximately 300 manufacturing, research. educational and service organizations of all types and sizes, comprising all segments of defense industry in all parts of the United States. Our essential role and purpose is to foster good and effective communications and a close working relationship between industry and those establishments of the Government whose functions relate in whole or in part to national security to the end that the national security is protected and advanced.

I am delighted to have this opportunity to discuss the current conventional arms transfer policy, the anticipated role tor U.S. Industry and the significance ot what we see as an evolving change In the Government/Industry relationship.

At the outset, let me state that NSIA supports the current policy In Its new conventional arms transfer objectives and approach. We welcome this latest assessment of the world as it exists today and the steps to be taken to restore America's leadership role. The enhancement of the statement of readiness of our friends and allies; the revitalization of our alliances; the establishment of more coherent east-west policies and strategies; and the reinvigoration and strengthenIng our own defense production capabilities are realistic objectives which we can achieve end whose achievement will contribute to the security of the world.

We find the statement as presented to this committee by Mr. James Buckley, Under Secretary of State tor Security Assistance, Science and Technology, as a clear enunciation of the current policy which is a pragmatic approach based on meeting security needs and which recognize arms transfer as a vital and constructive Instrument of American foreign policy. It Is a policy aimed at strengthening other nations with common security Interests and complementing V.S. defense efforts.

We in U.S. industry are regularly Involved with multiple European and Canadian corporations in various business opportunities, joint ventures, licenses and marketing activity. Because of this close association, constant interchange, travel, and intra-government relationship, we too are very anxious about major International tensions both in Europe and the Middle East. In Europe, the North Atlantic Treaty Organization (NATO) Is our major alliance. Within

the North American military/industrial defense community, NATO clearly provides the framework for discussion of many common needs. Economic bases, employment, multi-national projects, military sales, arms transfer, export licenses and Third World nations as markets have become our buzz words. During the la11t few years, the nations, their national Industrial bases, their political parties NATO and EEC have been In a constant ferment. The gradual erosion of military strength, the significance of national industrial bases, the growing pressure ot various forms of social democratic concepts and the focus on materialism are apparent.

NATO governments are anxious to increase exports, pre11sing their industries for international sales, both military and commercial, In all the world market• places-their objective being to develop and maintain a strong Industrial base, strong employment, strong currency, and to Insure major offsets to the energy costs.

It Is against this background that U.S. Industry and Government must combine to strengthen our will. our purpose. our management, our productivity and our talents both at home, within the NATO alliance, and competitively in the Third World markets.

The National Security Industrial Association concurs that the judicious use of arms transfer, and a flexible, pragmatic approach to arms sales, can strengthen the U.S. economy and Industrial base, contribute to the resolution of some of the economic problems of our allies and friends, and enhance deterrence and world-wide peace.

Last year I appeared before this committee to give an Industry view of the status of Mr. Carter's arms transfer policy and its direct Impact upon U.S. exporting business opportunities and employment In this country. I sought to clarify or place In perspective the military, political. and economic advantages which accrue to the United States In assisting a country in meeting Its legitimate defense requirements.

These advantages still hold true, and in fact, are even more important to the United States today as this country seeks to improve its industrial base, and strengthen and maintain International peace and security.

From the industry viewpoint, the sale of military products abroad contributes to higher employment at home, maintenance of a secure industrial base, an improved balance of payments. added profits for capital formation/technology and productivity investment, potentially lower unit prices for the Department of Defense and the much enhanced opportunity to expand our commercial activities with those countries purchasing defense items and services, to include logistics support and training. There are pluses for American foreign policy goals as well, such as reassertion of America's predominant position as guardian of the democratic values; a reduction In the need for direct U.S. military support and. In many cases, increased political influence in those countries receiving military equipment.

In testimony before your committee last year, I recommended six specific, pragmatic changes In the then current arms transfer policy to Include:

Eliminating the annual dollar volume limits on FMS and MAP.

Removal of the restriction of the sale of weapons abroad if they are not operationally deployed with U.S. forces and the prohibition of development or modification of a system solely for export.

Recognition that our allies and In some cases the Soviet Union, can and do Introduce advanced weapons systems Into regions where the U.S. refusal to be the first supplier forced countries, normally dependent upon the United States, to look elsewhere for their support.

Instruction of Embassy and military representatives abroad to assist U.S. manufacturers In their execution of the foreign military sales program and In competing for commercial contracts lo the host country. (Now corrected by the Department of State letter In April 1981).

Reinstatement of the allocation of Justifiable costs lo procurement regulations for foreign sales where they are undertaken In support of American foreign policy.

Permitting U.S. companies to compete freely for military contracts In countries that are recognized as friends of the United States without unnecessary preauthorization at the policy level by the State Department.

I also questioned the administration's prohibition on coproduction agreements to all countries other than NATO, Japan, Australia, and New Zealand.

The adjustment of the dollar limits which now force some sales into the foreign military sales category and the limitation of the commercial arms sales celling was also advocated. As regards this latter point, from an Industry viewpoint, we would usually prefer commercial sales over foreign military sales because they are quicker, simpler, and provide for more direct contact with the foreign buyer who may have additional needs not always recognizable when dealing through a third party. Industry experience Is that U.S. Government management controls over commercial arms sale!! are equally as stringent as In the case of foreign military sales. It, therefore, seems advantageous to permit each sovereign country to choose whether It desires to acquire goods and services through foreign military sales or via commercial sales.

We are pleased to see that the current arms transfer policy has, in essence, responded to our recommendations or acknowledged the basic Issues of concern to us such as coproduction agreements and third-country transfers with pledges to study the Issues and to consult with Members of Congress, Industry and others to srek workable guidelines for the future.

We welcome the opportunity to work with Government In this vital area of national security and offer, at this time, the following recommendations and comments:

Co-production, - Future co-productlon agreements, be they with our NATO allies or other friendly nations, should be supported by the Government, but details of actual agreements should be left to the companies actually involved.

Third-country sales. - The related Issue of third country sales should be worked out by the companies involved in their sales/co-production agreements in conformance with existing laws and controls. Obviously, there will be particular constraints to prevent any East-West loss of technology. I would emphasize that U.S. corporations are highly sensitive to the national security problems, and all aspects thereof.

Commercial ceiling. - There Is no apparent advantage to retaining the commercial ceiling. Our experience In the last administration proved that very few, If any. requests were denied.

We applaud this committee's recommendation to do away with the celling and would hope that the House of Representatives would follow your course of action.

Critical technologies. - With regard to the Issue of the transfer of sensitive technology, U.S. industry is in agreement with the need to protect the

technology base and Its applications from certain nations. To Insure that this critical military technology Is protected, while encouraging trade of high technology products, we recommend that U.S. Industry continue to work with Government In clarifying the technologies which should be restricted and the process and procedures required.

Marketing abroad. - We welcome the reversal of the former policy limiting assistance to be provided by overseas U.S. personnel to defense firms marketing abroad. The new policy directing U.S.G. overseas representatives to provide the same courtesies and assistance to firms that have obtained licenses to market Items on the U.S: munitions list as they would to those marketing other American commercial products abroad reflects a mature understanding or the realities or today's markets. In other tax legislation, the thorny problem of taxation of U.S. citizens working abroad is being addressed. We feel that, In the national interest. taxes on the first $75,000 of salary base should be excluded. Redress of this tax problem Is important to improving the military sales position of U.S. companies participating in the overseas markets.

International sales profitability. - An old issue revisited is that. In our view, it is in the national interest and will strengthen the U.S. industrial base to Improve the profitability of defense industry, both domestically and In International sales. Typically, new international sales of large scope take 2 to 4 years to develop. The cost of market development and the risk In overseas sales was previously recognized, and when properly justified. was compensated. Several years ago this adjustment mechanism was dropped. We in NSIA have just commenced an analysts of the whole problem of International sales, their risks and profitability, and what improvements should be made both by Government and industry. When complete, we will be pleased to share our recommendations with your committee.

Conclusion. - U.S. industry believes that the current policy and Its approach are well thought out, pragmatic and flexible; a policy within which U.S. industry can meet its goals and its responsibilities to this country and to the world community.

Contractors scrambling for U.S. defense dollars

By David Sylvester
Knight-Ridder News Service

SAN DIEGO, Calif. — Despite the greatest surge in defense spending since the Vietnam War, the talk among military contractors these days is not of boom times but of looming budget cuts.

The paradox stems from the ebb and flow of Washington politics. The Reagan administration promises; Congress takes away. And companies have to figure out which of the promises will stick long enough for them to make money.

As politicians in Washington debated the proposed $305 billion defense budget for fiscal 1985, about 200 military contractors gathered here a week ago to read tea leaves, examine entrails and confer over cocktails about the size and direction of spending. Company marketing and sales executives as well as military planners met at a conference organized by the New York market research firm of Frost & Sullivan and heard the latest predictions:

- Spending will rise but largely for established programs. Few new research programs will start this year, cutting off a source of business.
- After being burned by promised but canceled programs, companies may grow more selective about which contracts to pursue.
- Military planners are concerned that obsolete technology may be used in weapons because military red-tape and requirements slow down procurement. Weapons take at least twice as long as commercial products to design and produce.

Spending was foremost in the discussions. Earl Towson, director of

(See CONTRACTORS on 10-F)

Scrambling for U.S. defense dollars

CONTRACTORS, from 1-F

plans and programs at the Naval Weapons Center at China Lake, Calif., estimated that companies can expect at least 3 percent annual growth in real defense spending over the next several years. That should happen no matter how the budget debate is settled and no matter who wins the presidential election, he said.

The Reagan administration originally sought an increase of almost 15 percent in real military spending for fiscal 1985. But Walter Edgington, vice president of marketing for the GTE Corp. products group, said lower figures were more likely.

According to Edgington, Rep. Samuel S. Stratton (D., N.Y.), an arms proponent, has said that the Senate is expected to press for nearly an 8 percent real increase, whereas the House of Representatives will seek a 3.5 percent real increase.

Companies are more worried, however, that the big-ticket weapons favored by the Reagan administration, such as the B-1B bomber and the MX missile, will squeeze out spending on research. Many companies need research contracts to get their foot in the door for work.

"You have to plant your seed before you can harvest your corn," said Stan Tenold, general manager of Rolm's Mil Spec Computer Division. Rolm, which sells computers to military contractors, is considering seeking work on a contract that could face budget-cutting, he said. Many Silicon Valley companies, such as GTE's Western Division and Lockheed Missiles & Space Co., are benefiting from the boom in large weapons systems. Lockheed just signed a $5.8 billion contract to supply the next generation of nuclear missiles for the Trident submarines, and GTE is supplying command and control electronics for several systems.

Even though they do not receive weapons contracts themselves, smaller local companies will feel the pinch over time, as potential subcontracting work dries up.

The large weapons systems are less vulnerable to cuts than are research contracts: Weapons systems can be approved this year without large sums being spent right away — spending will build in future budgets; cuts in research financing will bring down the current budget faster, because the money is usually spent in the current year.

The Reagan administration asked to spend $34 billion on research, development, test and evaluation programs in the fiscal year that begins Oct. 1. This is up from $26.9 billion for fiscal 1984. Of this year's request, about $25 billion is expected to flow to companies for contracts; the rest is to be spent on contracts with universities and colleges.

In the procurement portions of the budget, enormous sums will go into new weapons that modernize what the industry calls the "strategic triad" of bombers, nuclear submarines and land-based missiles. GTE's Edgington estimated that about $200 billion, or 15 percent of the entire budget over the next five years, will go into these systems.

Some technology programs may lose because of what one critic called the "Black Hole" of the "Star Wars" weapons. The Reagan administration says these systems of attack satellites could shield the United States from nuclear assault by destroying Soviet missiles.

But these weapons are expensive. Edgington said that spending could absorb $17 billion to $26 billion over the next five years. "And this is just the tip of the iceberg," he said.

Voicing a widespread suspicion, Towson at the Naval Weapons Center termed the "Star Wars" plans "a stalking horse to scare the Soviet Union" into more serious arms negotiations. "To create that stalking horse ... it's going to be sucking dollars for a long way off."

In the midst of potential contract cuts, electronics companies say spending is strong for a host of new equipment and systems for the military's command, control, communications and intelligence. These are the electronic systems that allow commanders at headquarters to know what is going on at a battlefield, whether by satellite surveillance or by direct radio communications.

Yet even as the military is enamored of the new high-tech systems, one officer conceded, it has trouble bringing the latest technological developments into the weapons systems.

Designing of military weapons takes 10 years, during which commercial products will reach market and will be replaced at least twice. The military is then "faced with fielding obsolete equipment or playing catchup," said Gen. Bruce Harris.

Because of the impending cuts and the scrambling to save programs, companies may find themselves forced to make unrealistic promises to keep contracts. Jack Robertson, the Washington editor of the trade newspaper Electronic News, predicts that to avert cuts, more companies and defense services will tell more "white lies" about how well the promised programs will perform.

Financing will remain erratic, he predicted, making managers more careful in picking which contracts they pursue.

The Modesto Bee (Modesto, California) · 22 Jul 1984, Sun · Page 19

HELEN V. CRAWFORD — A graveside service will be held at 11 a.m. Tuesday at the Odd Fellows-Pioneer Cemetery for Helen Violet Crawford, 87, who died Friday in Modesto.

Visitation will be from 10 a.m. to 9 p.m. Monday at Franklin & Downs-Colonial Chapel.

Mrs. Crawford was born in Indiana. She lived in Modesto since 1934. She was a registered nurse who worked in all local hospitals; the most recent was Memorial Hospital-South in Ceres.

She was a member of the First United Methodist Church of Ceres, the Ceres American Legion Auxiliary, Neighbors of Woodcraft, Smyrna Chapter of O.E.S., Ceres Rebekah Lodge, Pamona Grange of Stanislaus County and the Ceres Grange.

She is survived by her husband, William Parker Crawford of Modesto; two sons, Walter R. Edgington of Virginia and Lloyd V. Edgington of Canada; a daughter, Irene Anderson of Hayward; 11 grandchildren; and eight great-grandchildren.

Jury Indicts GTE Trio In Defense Fraud Case

WASHINGTON (UPI) — A federal grand jury has indicted three GTE Corp. officials for conspiring to obtain and use secret Pentagon documents to get government contracts, the Justice Department announced.

Attorney General Edwin Meese said the Justice Department also charged the defense arm of the company, GTE Government Systems Corp., in a separate action with an additional count of conspiracy.

The Pentagon said Tuesday the Waltham, Mass., company, which manufactures electronic warfare equipment, will plead guilty to the charge that it used the classified internal documents "to defraud the United States."

The indictment, returned in U.S. District Court in Alexandria, Va., charged a consultant and two company officials with illegally obtaining sensitive Pentagon budget documents that "reflect the potential procurements of the department ... (and) contain proprietary and classified information."

Those officials used the inside information to help the company obtain government contracts, the indictment said.

The indictment also charged the three with unauthorized possession of a classified document, using a section of the law normally reserved for espionage cases.

The separate count of conspiracy charged against the company said GTE officials took extraordinary steps to conceal their activity, the Justice Department said.

Named as defendants in the five-count indictment were:

- Robert Carter, 55, of Mountain View, Calif., a former GTE employee who was marketing manager of the Electronic Warfare Organization of GTE's Western Division.
- Walter Edgington, 60, of Annandale, Va., a GTE vice president for marketing with offices in Rossyln, Va.
- Bernie Zettl, 62, of McLean, Va., a consultant doing business as Zettl Associates, with offices in Virginia.

If convicted, GTE Government Systems Corp. faces a maximum fine of $10,000. The individuals indicted face fines and sentences up to $30,000 and 25 years in prison.

Pentagon bid limits called poor secret

By FRANK GREVE
Knight-Ridder News Service

WASHINGTON — Defense contractors — often using classified documents — always know how much the Pentagon is willing to pay before they bid on a new weapon, according to industry experts.

They say they are shocked that this is news to the Justice Department.

The Pentagon's "not-to-exceed" prices, which are classified, are "quite available" to all bidders through informal, inside channels, said Jacques Gansler.

Gansler is a former Defense Department official and the author of *The Defense Industry*, a primer on the U.S. arms business.

● Pentagon still paying too much for parts, two House members say 16A

Gansler, like many other defense industry representatives, was appalled Wednesday to learn that three current and former employees of the GTE Government Systems Corp., a Connecticut-based defense electronics contractor, had been indicted on charges of conspiracy to obtain internal Pentagon planning documents relating to GTE products.

The information contained in the documents is so commonplace, Gansler said, that the indictments constitute "new evidence of the deterioration in government-defense industry relations."

Other defense executives and lobbyists shared his view of the case, the first produced by a three-year Defense Department investigation of classified information-swapping within the industry.

Such intramural industrial espionage, they said, is far more widespread than any other kind of security breach.

But Gansler and others said it is rarely taken seriously because all personnel involved — including those indicted in the GTE case — hold the appropriate security clearances.

Military reformers, meanwhile, tended to regard the latest case as "an outrageous example of the incredible symbiotic relationship between the contractors and the Defense Department," in the words of one congressional aide.

Morris Silverstein, head of the Defense Procurement Fraud Unit, which brought the case, argued that "if would-be bidders on a new weapons system know the gov-

Please see Bidders on Page 16

Bidders know limits, experts say

Continued from Page 1

ernment will pay $30 million to $100 million for it, who's going to bid $6 million?"

The indictments filed Tuesday allege that GTE repeatedly since 1978 obtained unauthorized copies of three classified, regularly updated Pentagon planning documents.

The documents are the Five-Year Defense Plan, which spells out the kinds and quantities of weapons to be bought and their predicted costs; Program Objective Memoranda, which outline the plans and projected prices for individual weapons; and Program Element Descriptions, which define and price subcontracted weapons elements.

According to the indictments, Robert R. Carter of Mountain View, Calif., GTE's marketing manager for electronic warfare programs; and Walter R. Edgington, GTE's Rosslyn, Va.-based marketing manager, paid consultant Bernie E. Zettl of McLean, Va., $119,510 over five years to mail the documents to a secret California post office box.

GTE Government Systems pleaded guilty Wednesday to "the receipt, without authorization, of Department of Defense budgetary and planning documents, some of which were classified," according to the company's statement.

GTE also paid a $10,000 fine, $580,000 in investigative costs plus reimbursement for the Pentagon's share of Zettl's consulting fees.

If convicted, the three defendants face five to 25 years in prison for a practice that apparently is so common that one defense representative jested, "You can hear the shredders grinding all over town."

Knowing the Pentagon's future plans is a defense industry representative's basic job in Washington, insisted one lobbyist.

"A company is trying to figure out what to do in the future. . . . Naturally, every company wants intelligence data on what funds are available for a program," he said.

The information often is classified, said Gansler, "but usually the (military's) program offices will talk to you about the future market and funding for a weapon system, if you have the proper clearances and the need to know.

"Usually, if you're a contractor," Gansler continued, "the uniformed program manager will have come to you and asked the price of a credible program."

Case of Purloined Papers Leaves Defense Industry Ranks Worrying

By ROBERT WATERS
Courant Staff Writer

GTE of Stamford, the corporate star of those familiar TV commercials in which one voice exclaims "Gee" and a second voice responds "No — GTE" may be privately mumbling some off-camera "gees" itself these days.

The reason: Two officials and a former consultant with a GTE subsidiary are scheduled to go on trial Feb. 18 in a criminal case that is reported to be a source of worry in the nation's defense industry.

The GTE defendants face charges that are believed to be based on unprecedented criminal allegations, the misuse of information from classified Pentagon budget planning documents.

The prosecution is expected to claim that purloined documents gave GTE a competitive advantage in winning Navy electronic warfare contracts.

Although little is being said publicly, the case is giving the defense establishment a collective headache because it appears to be based on transgressions that government officials have been overlooking for years.

"It's like a threat to prosecute every motorist who ever drove a single mile over the posted speed limit," quipped one Washington defense expert.

The classified documents in question, known around the Pentagon as POMs (for Program Objective Memorandums), FYDPs (for Five Year Defense Plans) and PDMs (Program Decision Memorandums) are widely distributed to Pentagon aides, congressional committees, senators, congressmen and defense contractors.

The documents rarely contain any data that could threaten national defense because the information is usually made public within a few months. But they are often very valuable to the firms which make the Pentagon's weapons.

Experts say they often contain data or strong hints about where a company should concentrate its resources to position itself for contracts. They are reported to be especially valuable in research and development projects where the competition is unusually fierce.

But POMs and similar documents are so widely distributed that they frequently fall into the hands of reporters who use the information for news stories to give the public an advance peek at the shape of the defense budget.

For example, when The Courant broke the news last August that the Air Force was planning to scrap the $1.2 billion Sikorsky Night Hawk helicopter program, the story was based on information that was leaked from a pending 1987 Air Force budget POM.

Although POM data is officially classified, it is often so widely distributed that one of Washington's most informed defense magazines, Aviation Week, recently joked editorially:

"POMs tend to get Washington's copying machines overheated ... POMs go through so many variations of copying that eventually they become unreadable."

Although little is being said publicly, the case is giving the defense establishment a collective headache...

But despite the generally acknowledged absence of real secrecy, the Justice Department decided four months ago to hit GTE's Government Systems Corp., based in Waltham, Mass., with a conspiracy charge involving misuse of the documents.

In addition to the two GTE executives and the consultant who are awaiting trial, the company itself also was charged.

The case exploded at a particularly bad time for GTE. The Connecticut-based firm, which won $707.7 million in Pentagon contracts in 1984, was a major competitor for an upcoming $5 billion Army electronics communications systems contract.

Although it protested that it had done nothing wrong, the company quickly decided to take the line of least resistence. Fearing it might be barred from Pentagon contracts, GTE permitted its subsidiary to cut a deal with the government.

In a sudden plea bargain arrangement, GTE agreed to pay a total of $590,000 in costs and fines to end the case. The strategy worked. GTE remained in the good graces of the Pentagon and eventually won the Army award, a plum that may create about 1,000 jobs in Massachusetts.

But the remaining defendants, former GTE consultant Bernie E. Zettl, GTE Vice President Walter R. Edgington and former GTE Marketing Director Robert R. Carter have, thus far, said they will fight the unusual charges.

Their trial is scheduled to be heard in a suburban Washington setting, the U.S. District Court in Alexandria, Va.

Prosecutors have disclosed that the Justice Department will claim that the defendants illegally obtained Navy POMs and other budget documents relating to several electronic warfare programs.

The budget informtion, says the prosecution, made it easier for GTE to submit a bid on the programs since GTE officials knew in advance how much the Navy was planning to spend for these programs.

"By improperly obtaining classified and proprietary DoD (Department of Defense) information, defendants gained an unfair advantage over their competitors in bidding on government contracts," said David Hopkins, the government's chief prosecutor.

"Through the concerted actions of the defendants, the integrity of the government's procurement process was invaded and destroyed," said Hopkins.

The lineup of defendants indicates that Zettl, who operated his own firm, called Zettl Associates, is the key to the prosecution.

The indictment indicates that Zettl, who was paid between $18,000 and $24,000 a year between 1979 and 1983, supplied the documents to GTE.

The government has spiced its case by noting two elements of mystery involving Zettl:

- The documents were mailed to a post office box in order to avoid using GTE's interdepartmental mailing system.
- A 1979 internal GTE memo refused to describe the services Zettl performed. "We do not want to list on paper the work he is doing," the memorandum said.

The GTE representatives have more to their case than the "everybody does it" defense.

At the bottom, they will claim that it is not a criminal offense for corporate representatives with valid Pentagon security clearances — which all three possessed — to distribute classified information among themselves.

The GTE case is markedly different from the Vietnam War's so-called Pentagon Papers case where classified data was distributed to the press.

"This case, by contrast, involves only the exchange of classified information among individuals — all of whom, by the government's own admission, had appropriate security clearances," said a defense lawyer during a recent pretrial hearing.

Some defense firms reportedly are worried that the case may lead to disclosures that other firms have been using budget planning documents to gain an edge over their rivals.

The GTE defendants themselves threw a scare into the rest of the industry when they recently tried to subpoena several large firms in an attempt to show that many firms have similar classified information in their files.

However, U.S. District Judge James C. Cacheris quashed the subpoenas after government lawyers successfully argued that the orders represented a "fishing expedition" into the files of the other firms. One firm, McDonnell Douglas, complained in a signed affidavit that it would cost $3.5 million merely to search its files for such data.

If convicted of the charges, Zettl and Edgington face maximum prison terms of up to 25 years and fines of $30,000. A conviction of Carter would expose him to a maximum term of five years and a $5,000 fine.

Conviction is considered far from certain in view of the security clearances held by the defendants. They are also helped by the fact that, in the past, cases of this type were usually handled in civil proceedings.

But if the GTE trio is convicted, defense experts believe it will produce at least a few worried executives among the ranks of the Pentagon's leading weapons contractors.

Complex Pentagon purchases offer opportunity for corruption

Los Angeles Times

The Department of Defense has 50,000 designated contract officers, dealing with 300,000 military suppliers. It grants an average of 62,000 contracts every day.

WASHINGTON — In February 1984 an agent of the Defense Criminal Investigative Service paid a call on Walter Edgington, a marketing executive at GTE Government Systems, just down the road from the Pentagon. The agent said that he was looking into the theft of secret military documents by defense contractors and free-lance consultants.

"You don't have to explain. I know why you're here," Edgington reportedly responded, volunteering that he first saw classified Pentagon documents at GTE shortly after joining the company in 1966 and had received a steady flow of secret data ever since.

"Every major corporation gets the same material," the investigator said he was told.

The GTE case, it now appears, was a chilling portent of the massive Pentagon bribery investigation now unfolding across the country. As the GTE affair demonstrated, the $150 billion-a-year defense acquisition business is so vast, so complicated and so little understood that it offers opportunities for corruption and questionable business practices on a staggering scale.

To understand the dimensions of the Pentagon's system for acquiring the weapons, trucks, ships, helmets, boots and the thousands of other things needed to project U.S. military power around the world, consider this: Not counting the legions of military and civilian personnel involved in secondary roles, the Department of Defense has 50,000 designated contract officers, dealing with 300,000 military suppliers. It grants an average of 62,000 contracts every day.

By themselves, the rules spelling out the way defense contracts are to be sought and awarded are bound into books that occupy — literally — almost a quarter mile of shelf space, Pentagon officials said.

And, for the business corporations large and small that seek government contracts, one of the critical elements at every stage of the long procurement process is information, especially advance information that competitors may not have.

Critical questions

What weapons and equipment are the armed forces thinking of obtaining — or cutting back on — in the future? How much money is being budgeted for current procurement of particular items and which programs are winning and which losing in the internal jockeying over funds and policy support?

Most important of all, once competition begins for a particular contract, what exactly does the Navy, or the Army or Air Force, want? What is the nature of the competition? Where is a rival's bid strong or weak? What clues can be gleaned about its product, its cost structure, manufacturing techniques and other proprietary matters? And what political forces are influencing — or might be brought to bear on — Pentagon decision-makers behind the scenes?

The quest for such information, as competitive in its own way as the struggle for contracts, has given rise to a tight-knit fraternity of consultants who know their way around the Pentagon jungle. Many labor diligently within the bounds of established procedures, but federal investigators say that some use payoffs, job promises or other gratuities to get such data improperly from contacts in the military bureaucracy.

The GTE episode offers an instructive primer or case study on how the defense acquisition business works in practice, how that practice sometimes diverges from theory and how easily it all can be corrupted.

It is a world of Beltway Bandits, Old Crows, rent-a-generals and let-the-buyer-beware — in this case, the buyer being the U.S. taxpayer.

In September 1985, the Department of Justice indicted GTE, Edgington, a second GTE executive and Bernie Zettl, a colorful consultant who allegedly was funneling secret Pentagon papers to GTE. GTE pleaded guilty to possession of classified material regarding electronic warfare programs and paid a $590,000 fine. Charges against the two GTE executives were dropped, but the Zettl case is unresolved.

Investigators were furious that their superiors stopped the inquiry at GTE and did not allow them to pursue leads implicating at least 25 other major defense contractors and dozens of consultants. One investigator called the GTE case the "tip of the proverbial iceberg" and said that the Department of Defense and the Department of Justice set the current query back two years by prematurely ending the earlier inquiry.

The Zettl case also opened a window on a little-known network of electronic warfare specialists known as the Association of Old Crows, a 25,000-member organization linking professionals in industry and the military. Zettl was one of the founders of the group, named for a World War II operation that jammed German radar signals.

The Crows, scattered throughout the defense electronics industry worldwide, consist mainly of retired military officers who have moved into high-ranking positions in the major companies that supply sophisticated military jamming, surveillance and communications gear.

Old Crows give information

The association, based in Alexandria, Va., provides a remarkably efficient system for moving valuable information, officials familiar with the group said. Members, who maintain their military contacts and seek to provide their clients or companies with such things as early tips on future Pentagon plans, meet formally and informally throughout the United States, Europe and Asia to swap war stories and industry gossip.

Gus Slayton, the group's executive director, asserted that the Old Crows are in no way linked to the present scandal. Only one of the 16 Pentagon officials and private consultants served with search warrants last week is a member, Slayton said, declining to name him. Numerous executives of the defense companies searched belong to the group.

According to charges filed in the GTE case, the company went to extraordinary lengths to conceal its possession of classified military documents and their sources. An official of a subsidiary of the company rented a post office box in California to receive the secret documents allegedly obtained by Zettl to keep them out of the regular GTE internal mail system, the indictment said.

According to an associate, the publicity surrounding the GTE case ruined Zettl professionally and financially. He no longer is in the defense consulting business, has moved from the Washington area and could not be reached for comment.

U.S. downs Iranian jetliner

290 aboard; Reagan calls shooting 'a terrible human tragedy'

President backs Navy procedures

By Timothy J. McNulty
Chicago Tribune

WASHINGTON—Calling it "a terrible human tragedy," President Reagan swiftly expressed his regret Sunday over the Iranian airliner shooting. But fallout from the erroneous missile attack seemed certain to create change in American involvement in the Persian Gulf.

The international embarrassment and the failure of the U.S. military to discern an unarmed airliner also may affect America's attitudes and policy long after this administration leaves office next year.

The ship-to-air shooting occurred in the middle of the 4th of July holiday weekend. To downplay any sense of crisis, the President remained on vacation at the Camp David presidential retreat in Maryland.

In his official statement, released by White House spokesman Marlin Fitzwater, Reagan did not directly apologize for downing the plane, which was carrying 290 people on a scheduled Iran Air flight over the Persian Gulf. The President said it appeared the U.S. had shot down the European-built, wide-body Airbus "in a proper defensive action."

"This is a terrible human tragedy," Reagan said, adding that the Defense Department would conduct a full investigation.

The impact of the disaster was difficult to gauge immediately, not only because it was a holiday weekend but because the Pentagon already was under fire for the procurement fraud scandal. Questions about the quality and performance of the Navy's equipment were raised immediately after news of the shooting was announced.

"There will be congressional hearings on this as sure as night follows day, not only on the equipment but on the [Navy] instructions and the rules of engagement," said Sen. Alan Dixon (D., Ill.), a member of the Senate Armed Services Committee.

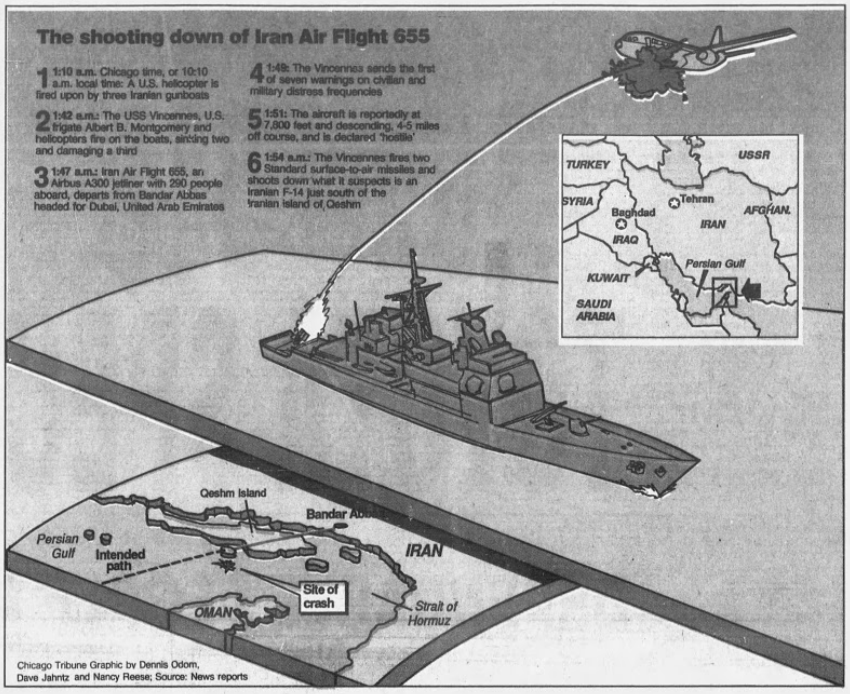
In addition, this is a presidential election year, when turmoil in foreign policy can have a turbulent effect on public opinion. Democratic congressional leaders generally were cautious in criticizing the naval action.

The apparent Democratic presidential nominee, Michael Dukakis, said he hoped a Pentagon investigation would "quickly and fully respond" to questions about the incident.

"All Americans are saddened by the loss of life in the Persian Gulf," Dukakis said. "Plainly, our armed forces have a right to defend themselves."

"The U.S. has been more than a year in the Persian Gulf, and still there is no defined policy, still no firm commitment to end the war," said Jesse Jackson, the other major figure in the Democratic

See Policy, pg. 5



Tehran deplores 'criminal act'

By Nicholas M. Horrock
Chicago Tribune

WASHINGTON—A U.S. Navy warship shot down an Iranian airliner carrying 290 passengers over the Persian Gulf early Sunday after the crew mistook the giant Airbus for an attacking warplane, Department of Defense officials said.

According to Iran's official Islamic Republic News Agency, there were no survivors. Navy officials in Washington said crews in the gulf saw the Airbus "disintegrate" when a missile fired by the cruiser USS Vincennes hit it.

"We will not leave the crimes of America unanswered," Iran's state-run radio said in a commentary.

Iranian television showed film of search efforts and said 110 bodies had been recovered.

The report said the victims included 66 children. Also aboard were 156 men and 52 women passengers and 16 crew members. Airline sources 250 of those aboard were Iranians. The rest were Indians, Pakistanis, Koreans, Japanese and Arabs.

The A300 Airbus, Iran Air Flight 655, was bound from Tehran to Dubai in the United Arab Emirates. It had just made a stop at Bandar Abbas in southern Iran and was on the last leg of its journey, 150 miles. It was flying at an altitude of 7,500 feet when it was attacked.

This is the first time a civilian airliner has been shot down since September, 1983, when a Soviet MiG-23 shot down a Korean Boeing 747, killing all 269 people aboard.

President Reagan, spending his 4th of July weekend at Camp David, issued a three-paragraph written statement saying he was "saddened" by the attack. "This is a terrible human tragedy. Our sympathy and condolences go out to the passengers, crew and their families," he said.

Iranian Prime Minister Hussein Musavi said the incident showed that the U.S. had "entered a more direct war with our nation" and added that Washington would have to face the consequences of "this criminal act." Musavi warned the U.S. "that its latest crime against the Iranian people would only further arouse the abhorrence of [Iranians] against Washington," according to the news agency.

Reagan's statement said the "course of the Iranian civilian airliner was such that it was headed directly for the USS Vincennes, which was at that time engaged with five Iranian Boghammer boats that

Gulf incident shows limitations of radar

By David Evans
Chicago Tribune

WASHINGTON—Radars are the long-range eyes of the surface Navy, and the radars on the cruiser Vincennes employed in Sunday's shooting down of an Iranian airliner were the most advanced in the fleet. Yet, somehow, they were unable to tell the difference between a large civilian airliner and a much smaller F-14 jet fighter.

The ship's skipper thought he was shooting at a hostile Iranian F-14, Adm. William Crowe said in a Pentagon news conference. Instead, his missiles downed an Iran Air A300 Airbus carrying 290 passengers and crew.

The tragic destruction of the Iranian airliner came as no surprise to various experts familiar with the limitations of even advanced radars.

The Vincennes is one of the Navy's newest ships, equipped with the powerful Aegis radar system. Like all radars, the Aegis works by sending out strong pulses of radio waves and then "listening" for echoes from objects in the radar beam.

Generally, the bigger the object spotted, the bigger the echo.

The strength of the echo is called the "radar cross-section" of the target.

Although the A300 Airbus is about three times bigger than the F-14, its radar cross-section might not be much different. The sheer size of an airplane is not nearly as important as its shape and its angle with respect to the radar beam.

"The radar cross-section on a

Trading defense data becomes a way of life

By Christopher Drew and William Gaines
Chicago Tribune

This is the second in a series of articles about the Pentagon procurement scandal.

WASHINGTON—Walter Edgington, a marketing official for GTE Corp., wasn't ruffled in March, 1984, when two investigators from the Defense Department stopped by to question him about evidence that a private consultant was providing GTE with unauthorized copies of secret Pentagon documents.

"You don't have to explain," Edgington said. "I know why

file room so they could at least be controlled."

"Every major corporation gets the same material," the executive declared.

Edgington also acknowledged that he had never tried to stop the practice, which the investigators considered illegal industrial espionage.

Vrdolyak's negatives a big plus for Pucinski, poll says

By Thomas Hardy
Political writer

Campaign '88

Aurelia Pucinski is not Edward Vrdolyak, and that's a good enough reason for most voters to support her over the controversial former Chicago alderman in their race for clerk of Cook County Circuit Court, a new Tribune poll shows.

Democrat Pucinski holds a commanding lead of 55 percent to 27 percent over Republican Vrdolyak among likely voters in the November countywide con-

lots against Vrdolyak, rather than for her. In fact, among her voters, 10 percent said they had never heard of her and 28 percent said they had no opinion of her.

She is ahead among city, suburban, white, black and Hispanic voters by substantial margins, the poll indicates. In addition, her voters are vastly more committed to her than Vrdolyak's

Defense

Continued from page 1

three weeks that a massive new investigation of the defense industry has uncovered evidence of widespread fraud, bribery and misuse of classified documents.

Evidence in this unfolding inquiry suggests that the award of a significant portion of the Pentagon's $160 billion annual procurement budget may be corrupted by these techniques.

The disclosures have focused intense public attention on the defense companies and their consultants, but they also have rekindled a bitter controversy over why the Justice Department waited so long to mount a comprehensive attack on such practices.

Sen. Charles Grassley (R., Ia.) has renewed charges he first made in 1985 that the government's procurement fraud unit, created with great fanfare in 1982, bungled the investigation in which Edgington was interviewed by failing to vigorously pursue his and others' suggestions of rampant cheating. The unit is directed by the Justice Department and uses investigators from the Pentagon and other agencies.

Robert Segal, a former official the Defense Criminal Investigative Service and supervisor of the agents who interviewed Edgington, said it was "incomprehensible" to him in 1985 when prosecutors showed little interest in leads suggesting that as many as 25 defense contractors were receiving unauthorized copies of classified military planning documents.

Three other investigators familiar with the case said in interviews that they also had picked up a number of "inferences" in 1983 and 1984 that industry consultants were giving bribes and gratuities, such as trips to Las Vegas, to Pentagon employees ranging from clerks and secretaries to career military officers in exchange for the documents.

These investigators, who asked not to be identified, conceded that they had little hard evidence of bribery. But Segal and the other three all said they were confident they would have developed such evidence if Justice Department officials had sought court authorization for wiretaps or assigned more than a handful of agents to the inquiry.

By contrast, nearly 100 FBI and naval investigative agents are working on the current investigation, which is being coordinated by Henry Hudson, the U.S. attorney for the Eastern District of Virginia. They have recorded about 4,800 conversations through wire taps, including nearly 700 deemed to be incriminating.

As it turned out in the GTE case, a federal grand jury directed by prosecutors working for the procurement fraud unit in September, 1985, indicted GTE, Edgington, former GTE marketing manager Robert Carter and Bernie Zettl, the consultant who allegedly had supplied the company with the documents.

The jury charged that the three men and the company, which makes electronic warfare equipment, had conspired for nearly seven years to defraud the government of "the right to have its procurement process conducted free from improper and unauthorized conversion and utilization by prospective contractors of Department of Defense documents which contain proprietary and classified information." It also accused Zettl, Edgington and Carter of violating statutes on espionage and theft of government property.

At the time, the indictment of a major defense firm and its consul-

The GTE investigation

■ **1966:** Walter Edgington goes to work for GTE and finds unauthorized copies of Pentagon documents circulating at the firm. That was common among defense contractors, he later tells investigators.

■ **March, 1984:** Defense Department investigators question Edgington, among others, about evidence that a consultant was giving GTE secret Pentagon information.

■ **September, 1985:** A federal grand jury indicts GTE for conspiring to defraud the Defense Department and indicts Edgington, another GTE employee and a GTE consultant on various charges of conspiracy, espionage and theft. The firm agrees to pay a fine and establish a policy to discourage similar wrongdoing. The three individuals plead innocent.

■ **October, 1985:** Sen. Charles Grassley (R., Iowa) holds a hearing into charges that the GTE investigation was truncated before other defense firms could be implicated. The Justice Department denies it. Later that month, the Defense Department awards GTE another contract.

■ **March, 1988:** The Justice Department drops charges against the two GTE employees indicted in 1985 and reduces the charges against the consultant, Bernie Zettl.

■ **July, 1988:** Nearly three years after his indictment, Zettl is still awaiting trial in federal court in Alexandria, Va.

Chicago Tribune Graphic

Under federal procedures, criminal cases can be supervised by U.S. attorneys or by prosecutors from the Justice Department headquarters, and there often is competition among them for the best cases.

But Deputy Assistant Atty. Gen. Victoria Toensing, who now oversees the Justice Department's fraud section, responded that it is "irresponsible of [Grassley] to criticize these career people who are working their tails off on these cases."

Toensing said department officials viewed the GTE-Zettl indictment as a crucial test of whether they could use the theft and espionage statutes to crack down on people trading secret documents. She said the officials had planned to see how the case turned out before seeking other similar indictments.

She also disputed the assessments by Segal and the other investigators of how much evidence they had gathered, saying it amounted to only four possible cases other than GTE-Zettl and did not appear to justify the use of special wiretapping techniques or extensive additional staff.

Toensing said she also finds some irony in Grassley's preference for Hudson in that the fraud unit referred those four possible cases to Hudson's office, and Hudson declined to prosecute two of them. She said he is still working on the others.

Whatever the truth about the quality of the evidence, it is clear in reviewing the three boxes of court files in the GTE-Zettl case that ample indications were emerging years before the current inquiry that there was a longstanding problem with misuse of classified documents.

Officials have said the current investigation started in September

Sen. Charles Grassley says the government procurement fraud unit "bungled" the investigation.

Victoria Toensing of the Justice Department said investigators "are working their tails off."

ton's interview with the two investigators, the file contains extensive details about how GTE allegedly funneled $120,000 in payments to Zettl from 1979 through 1983 and tried to mask these transactions in ways that closely parallel some of the activities said to be under scrutiny in the current investigation.

According to the original indictment, GTE disguised its payments to Zettl for the documents as consulting fees, which ranged from a low of $18,200 in 1980 to a high of $29,200 in 1981. The indictment said the documents related to electronic warfare procurements and included some of the military's most sensitive long-range plans.

Zettl, in turn, hid "the true nature of his activities by providing monthly reports ... which made only veiled or no reference at all to the documents being provided," the indictment said. It said that by the time he provided the documents to GTE, "markings identifying their source within the Department of Defense [had been] removed."

Company officials also took several other steps to conceal the arrangement.

According to the indictment, Edgington and Carter restricted circulation of the documents provided by Zettl to "a very few people within GTE" and did not allow them to be entered into the company's document control system.

The indictment alleged that Carter, who worked in Mountain View, Calif., and other GTE employees rented a post office box in California "solely to receive the documents" that Zettl provided so that people at Edgington's office in Rosslyn, Va., could avoid using the company's interdepartmental mail system.

At one point, Carter showed another GTE employee one unauthorized document and cautioned him not to talk to anyone about it, the indictment said. A few months later, a GTE official wrote a memo stating, in reference to Zettl, that "we do not want to list on paper the work that he is doing."

And after that, Carter wrote a memo advocating renewal of Zettl's contract because he "provides advanced marketing and planning information which is not available through other corporate marketing offices."

Edgington's lawyers, Brendan Sullivan and Barry Simon, who since have gained national attention by defending retired Marine Lt. Col. Oliver North in the Iran-contra affair, also named at a court hearing in January, 1986, several other defense companies that they believed had easy access to unauthorized documents

Northrop headquarters in Los Angeles in December, 1982.

● McDonnell Douglas Corp.'s security director told officials at two other defense companies during the second half of 1985 that he had classified planning documents "and wanted to know what to do with them."

● A Honeywell Inc. employee believed her company also had classified Pentagon documents in its files.

Prosecutors had taken the position that it was against the law even for people with government security clearances—including Zettl, Edgington and Carter—to remove secret documents from special government reading rooms without authorization.

Federal officials feared that transporting the documents increased chances that the information in them could be used to subvert procurement processes or fall into the hands of unfriendly governments. In 1978, during the Carter administration, several Boeing officials had come under investigation when security agencies discovered that Soviet eavesdroppers were picking up national security data by listening to Boeing's long-distance telephone calls.

In the Boeing case, the company was allegedly transmitting secret contract information obtained from the Pentagon.

Sullivan and Simon were attempting to show, however, that unauthorized use of the documents was so common that it would have been unfair to single out Zettl, Edgington and Carter for prosecution.

Simon said during the hearing that a McDonnell Douglas lawyer had talked to one of Simon's associates about "the possibility of filing an amicus brief on the grounds that this is a widespread industry practice and the various people in the industry should come forward and say that, so the court would be aware of it."

But, Simon said, McDonnell Douglas officials, who have denied any wrongdoing, quickly changed their minds once they focused on the fact that the Justice Department had become more interested in prosecuting such cases.

"Frankly, the government's posture itself has caused a reign of terror out in the defense industry," Simon said. "People are afraid of coming forward and admitting to use of these documents.

"The issue here is that this is conduct which has never, ever in the past been viewed as illegal."

Also about that time, a former McDonnell Douglas official approached another investigative agency at the Pentagon with similar allegations that the company had developed a system for obtaining secret Defense Department

1986, letter to the director of the Defense Investigative Service.

Betzler later repeated his story to a state court jury in Arlington, Va., which awarded him $260,000 in damages in connection with his dismissal.

Betzler testified in court that McDonnell Douglas typically hired recently retired military officers who sometimes ask their friends in the services to provide classified information to the company.

Betzler also introduced into evidence a letter he had written to a company attorney in 1982 in which he had warned that some of the retired officers had "even set up a procedure whereby these documents would be surreptitiously taken to Washington, put in a special safe for surreptitious documents and, at some point in time, they would transport those by company Learjet to McDonnell Douglas Headquarters in St. Louis."

Betzler told of one instance in which he transported "unlogged classified information" in a sealed envelope tucked into a briefcase.

He characterized other classified information received through secret channels as "tactical air warfare matters, planning data ... requirements ... inside memos on other people's products and competitors' performance."

Betzler also complained in his court case about lavish entertainment of government officials by McDonnell Douglas officials. One exhibit was an expense voucher from July, 1984, that totaled $566 for dinner and show in Las Vegas. Neil Eddins, the company's director of program development, had invited an Air Force colonel and two staff members of the House Armed Services Committee. According to the voucher, the purpose of the get-together was to discuss the federal defense budget.

Betzler was hired by Northrop in 1985, and he complained that it also used former government employees to get confidential defense information.

Betzler said he also had seen such practices since he had taken his first job in the industry in 1951, with North American Aviation. He said he left North American in 1961 when it hired a man "who was supposed to do whatever had to be done to get the right people to buy our products. He had a suite over at the Carlton Hotel and he had girls and big, big bucks."

Betzler said the man was a friend of Bobby Baker, the late President Lyndon Johnson's protege who later was convicted on corruption charges.

It could not be determined whether Pentagon investigators ever followed up on Betzler's allegations. Justice Department officials said they checked out the instances cited by Edgington's lawyers of alleged improper use of documents but did not find enough evidence to warrant prosecution.

"There's a vast difference between historical cases where you only have a person with a document in hand and no conversation about it," Toensing, the deputy assistant attorney general, said, comparing those instances to the current wiretap-supported inquiry, "and a case where in the middle of it you have conversations where the people are telling what they are doing."

Segal and some of the other investigators familiar the GTE-Zettl case agreed. They said one of the things they most regret is that fraud unit prosecutors flatly rejected their requests to seek similar

tant on such charges was virtually unprecedented. GTE swiftly pleaded guilty and agreed to pay a fine of $580,000 and to develop a policy against future misuse of government documents.

Zettl, Edgington and Carter pleaded innocent, and their cases soon became entangled in prolonged disputes over whether it would pose a national security risk to introduce some of the classified documents into evidence at a public trial.

The prosecutors eventually had to drop the espionage and theft counts against Zettl and all the charges against Edgington and Carter because they could not agree with defense lawyers on a compromise plan to substitute summaries for some of the secret materials. Zettl, a retired Air Force major, is still awaiting trial on the conspiracy charge.

But the prosecutors never attempted to expand that investigation to seek charges against other companies.

Grassley said he believes this was simply because that inquiry was not directed by "a very aggressive-type person" like Hudson.

1986, when a retired Navy officer working for a defense contractor told authorities that a consultant had offered to sell him secret information on an upcoming Pentagon contract.

"at least be controlled."

"Every major corporation gets the same material," the executive declared.

Edgington also acknowledged that he had never tried to stop the practice, which the investigators considered illegal industrial espionage.

"If you already have your feet in the mud," Edgington said. "Why take a shower? You still can't get rid of past dirt."

As Edgington's colloquial analogy suggests, trading in secret documents and inside information on government contracts has been part of life for some of the nation's largest defense contractors for at least two decades.

Big new investigation

Federal law enforcement officials have revealed in the past three weeks that a massive new investigation of the defense industry has uncovered evidence of widespread fraud, bribery and misuse of classified documents.

Evidence in this unfolding inquiry suggests that the award of a significant portion of the Pentagon's $160 billion annual procurement budget may be corrupted by these techniques.

The disclosures have focused intense public attention on the defense companies and their consultants, but they also have rekindled a bitter controversy over why the Justice Department waited so long to mount a comprehensive attack on such practices.

Sen. Charles Grassley, R-Iowa, has renewed charges he first made in 1985 that the government's procurement fraud unit, created with great fanfare in 1982, bungled the investigation in which Edgington was interviewed by failing to vigorously pursue his and others' suggestions of rampant cheating. The unit is directed by the Justice Department and uses investigators from the Pentagon and other agencies.

Robert Segal, a former official of the Defense Criminal Investigative Service and supervisor of the agents who interviewed Edgington, said it was incomprehensible to him in 1985 when prosecutors showed little interest in leads suggesting that as many as 25 defense contractors were receiving unauthorized copies of classified military planning documents.

Hints of bribery

Three other investigators familiar with the case said in interviews that they also had picked up a number of "inferences" in 1983 and 1984 that industry consultants were giving bribes and gratuities, such as trips to Las Vegas, to Pentagon employees ranging from clerks and secretaries to career military officers in exchange for the documents.

These investigators, who asked not to be identified, conceded that they had little hard evidence of bribery. But Segal and the other three all said they were confident they would have developed such evidence if Justice Department officials had sought court authorization for wiretaps or assigned more than a handful of agents to the inquiry.

By contrast, nearly 100 FBI and naval investigative agents are working on the current probe. Agents have recorded about 4,800 conversations through wiretaps, including nearly 700 deemed to be incriminating.

As it turned out in the GTE case, a federal grand jury, directed by prosecutors working for the procurement fraud unit, in September 1985 indicted GTE, Edgington, former GTE marketing manager Robert Carter and Bernie Zettl, the consultant who allegedly had supplied the company with the documents.

The jury charged that the three men and the company, which makes electronic warfare equipment, had conspired for nearly seven years to defraud the government of "the right to have its procurement process conducted free from improper and unauthorized conversion and utilization by prospective contractors of Department of Defense documents which contain proprietary and classified information." It also accused Zettl, Edgington and Carter of violating statutes on espionage and theft of government property.

GTE pleads guilty

At the time, the indictment of a major defense firm and its consultant on such charges was virtually unprecedented. GTE swiftly pleaded guilty and agreed to pay a fine of $580,000 and develop a policy against future misuse of government documents.

Zettl, Edgington and Carter pleaded innocent, and their cases soon became entangled in prolonged disputes over whether it would pose a national security risk to introduce some of the classified documents into evidence at a public trial.

The prosecutors eventually had to drop the espionage and theft counts against Zettl and all the charges against Edgington and Carter because they could not agree with defense lawyers on a compromise plan to substitute summaries for some of the secret materials. Zettl, a retired Air Force major, is still awaiting trial on the conspiracy charge.

But the prosecutors never attempted to expand that investigation to seek charges against other companies.

Grassley said he believed this was simply because that inquiry had not been directed by "a very aggressive-type person." Under federal procedures, criminal cases can be supervised by U.S. attorneys or by prosecutors from the Justice Department headquarters, and there often is competition among them for the best cases.

'This is a widespread industry practice, and the various people in the industry should come forward and say that, so the court would be aware of it'

— McDonnell Douglas lawyer

But Deputy Assistant Attorney General Victoria Toensing, who now oversees the Justice Department's fraud section, responded that it was "irresponsible of (Grassley) to criticize these career people who are working their tails off on these cases."

'Test' indictment

Toensing said department officials had viewed the GTE-Zettl indictment as a crucial test of whether they could use the theft and espionage statutes to crack down on people trading secret documents. She said the officials had planned to see how the case turned out before seeking other similar indictments.

She also disputed the assessments by Segal and the other investigators of how much evidence they had gathered, saying it amounted to only four possible cases other than GTE-Zettl and did not appear to justify the use of special wiretapping techniques or extensive additional staff.

Whatever the truth about the quality of the evidence, it is clear in reviewing the three boxes of court files in the GTE-Zettl case that ample indications were emerging years before the current inquiry that there was a longstanding problem with misuse of classified documents.

Officials have said the current investigation started in September 1986, when a retired Navy officer working for a defense contractor told authorities that a consultant had offered to sell him secret information on an upcoming Pentagon contract.

Besides the summary of Edgington's interview with the two investigators, the file contains extensive details about how GTE allegedly funneled $120,000 in payments to Zettl from 1979 through 1983 and tried to mask these transactions in ways that closely parallel some of the activities said to be under scrutiny in the current investigation.

According to the original indictment, GTE disguised its payments to Zettl for the documents as consulting fees, which ranged from a low of $18,200 in 1980 to a high of $29,200 in 1981. The indictment said the documents related to electronic warfare procurements and included some of the military's most sensitive long-range plans.

Zettl, in turn, hid "the true nature of his activities by providing monthly reports . . . which made only veiled or no reference at all to the documents being provided," the indictment said. It said that by the time he had provided the documents to GTE, "markings identifying their source within the Department of Defense (had been) removed."

At a court hearing in January 1986, Edgington's lawyers, Brendan Sullivan and Barry Simon, who since have gained national attention by defending retired Marine Lt. Col. Oliver North in the Iran-contra affair, also named several other defense companies that they believed had easy access to unauthorized documents.

The attorneys asserted that they had obtained evidence from industry sources that:

- Northrop Corp. marketing officials examined three different types of classified Pentagon planning documents at a meeting at Northrop headquarters in Los Angeles in December 1982.
- McDonnell Douglas Corp.'s security director told officials at two other defense companies during the second half of 1985 that he had classified planning documents "and wanted to know what to do with them."
- A Honeywell Inc. employee believed her company also had classified Pentagon documents in its files.

Prosecutors had taken the position that it was against the law even for people with government security clearances — including Zettl, Edgington and Carter — to remove secret documents from special government reading rooms without authorization.

Federal officials feared that transporting the documents increased chances that the information in them could be used to subvert procurement processes or fall into the hands of unfriendly governments. In 1978, during the Carter administration, several Boeing officials had come under investigation when security agencies discovered that Soviet eavesdroppers were picking up national security data by listening to Boeing's long-distance telephone calls.

In the Boeing case, the company was allegedly transmitting secret contract information obtained from the Pentagon.

Sullivan and Simon were attempting to show, however, that unauthorized use of the documents was so common that it would have been unfair to single out Zettl, Edgington and Carter for prosecution.

Simon said during the hearing that a McDonnell Douglas lawyer had talked to one of Simon's associates about "the possibility of filing an amicus brief on the grounds that this is a widespread industry practice and the various people in the industry should come forward and say that, so the court would be aware of it."

However, Simon said, McDonnell Douglas officials, who have denied any wrongdoing, quickly changed their minds once they focused on the fact that the Justice Department had become more interested in prosecuting such cases.

Also about that time, a former McDonnell Douglas official approached another investigative agency at the Pentagon with similar allegations that the company had developed a system for obtaining secret Defense Department documents.

John Betzler, who contended that he had been fired from his marketing job after 22 years with the company for trying to blow the whistle on such practices, detailed the allegations in an April 1986 letter to the director of the Defense Investigative Service.

Betzler later repeated his story to a state court jury in Arlington, Va., which awarded him $260,000 in damages in connection with his dismissal.

Betzler testified in court that McDonnell Douglas typically hired recently retired military officers who sometimes asked their friends in the services to provide classified information to the company.

Betzler also introduced into evidence a letter he had written to a company attorney in 1982 in which he had warned that some of the retired officers had "even set up a procedure whereby these documents would be surreptitiously taken to Washington, put in a special safe for surreptitious documents, and, at some point in time, they would transport those by company Learjet to McDonnell Douglas Headquarters in St. Louis."

Betzler also complained in his court case about lavish entertainment of government officials by McDonnell Douglas officials. One exhibit was an expense voucher from July 1984 that totaled $566 for dinner and a show in Las Vegas. Neil Eddins, the company's director of program development, had invited an Air Force colonel and two staff members of the House Armed Services Committee. According to the voucher, the purpose of the get-together was to discuss the federal defense budget.

ut Sullivan is proof beyond a reasonable doubt that looks deceive. By all accounts, he is intense, tough, tenacious, tireless, obsessively dedicated to his clients and in full command of the facts.

"He's not a Clarence Darrow who overwhelms you with his physical presence," said a lawyer who watched Sullivan defend an accused corporate executive a few years ago. "But watch out. He uses a stiletto instead of a machete."

In two recent cases, the Sullivan-Simon team's strategy, perseverence and resourcefulness worked beautifully.

Helped by an expert's analysis of watermarks, they won a dismissal of income tax evasion charges against the Omni International Corp. by showing that the government had backdated some documents. The government's conduct "shocks the court's conscience," the trial judge said.

And by turning the Classified Information Procedures Act to their advantage, Sullivan and Simon freed former GTE Corp. marketing executive Walter Edgington of charges of illegally obtaining secret planning documents from the Pentagon.

Government investigators had reported that Edgington, confronted by evidence against GTE, told them, "You have the company by the short hairs and I'm one of those hairs."

But Sullivan convinced a judge that classified documents were essential to the defense. The Justice Department appealed, lost and dropped the charges a year ago rather than publicly reveal the documents Sullivan demanded.

1989 (April 21) - Lawyer Sullivan

NATIONAL / WORLD NEWS

2A FRIDAY, APRIL 21, 1989 THE MIAMI HERALD

North's Mr. Peepers is no potted plant

REPORT FROM WASHINGTON, D.C.

By AARON EPSTEIN
Herald Washington Bureau

WASHINGTON — As Brendan Sullivan is famous for saying, he's no potted plant. If he were, there would be a warning about the thorns.

Throughout his career as a criminal defense lawyer, he has stung opponents, blistered witnesses and irritated judges.

Two summers ago, Sullivan, representing his most renowned client, Marine Lt. Col. Oliver North, snarled at interrogators of the Iran-contra committee, "That's none of your business" and "Get off his [North's] back."

But in his current defense of North against criminal charges, the 47-year-old lawyer altered his style. Except for an emotional final argument to the jury, he displayed a gentler temperament that TV viewers might not recognize as Brendan Sullivan's.

Whatever courtroom style he chooses, Sullivan's clients rarely go to jail, and he has become Washington's hottest criminal lawyer.

For defending North, he and his firm are expected to bill as much as $10 million.

Sullivan is so busy these days with North that he has little time for his wife, Lila, their three children or a new 52-foot sloop. He named the boat Confrontation — because "it's something we do every day."

Sullivan's belligerent side burst into the public consciousness in July 1987 when millions of TV viewers watched him growl like a lion guarding an endangered cub whenever predators on the Iran-contra panel threatened to wound North.

With a single phrase, the man by North's side burst into public attention as a lawyer who couldn't be cowed. It happened when the chairman, Sen. Daniel Inouye, D-Hawaii, suggested, after yet another Sullivan objection, that North could take care of himself.

"Let the witness object, if he wants to," the senator told Sullivan. "Well, sir," Sullivan replied. "I'm not a potted plant. I'm here as the lawyer. That's my job."

Sullivan

Brendan Sullivan's clients rarely go to jail. He has become the capital's hottest criminal defense lawyer.

More like milking cows

In the North trial, Sullivan primarily faced government witnesses who are friends and admirers of North. And so, as the prosecutor recently remarked, Sullivan's cross-examinations were more like milking cows than battling bulls.

There's nothing physically imposing about Sullivan. Thinning, mostly gray hair. Horned-rimmed glasses. Slight, almost frail figure. In other eras, Sullivan could been a stand-in for Harold Lloyd, Mr. Peepers or Barney Fife.

But Sullivan is proof beyond a reasonable doubt that looks deceive. By all accounts, he is intense, tough, tenacious, tireless, obsessively dedicated to his clients and in full command of the facts.

"He's not a Clarence Darrow who overwhelms you with his physical presence," said a lawyer who watched Sullivan defend an accused corporate executive a few years ago. "But watch out: He uses a stiletto instead of a machete."

Helped by an expert's analysis of watermarks, Sullivan and his younger partner, Barry Simon, recently won the dismissal of tax evasion charges against Omni International Corp. by showing that the government had back-dated documents. The government's conduct "shocks the court's conscience," the judge said.

And by turning the Classified Information Procedures Act to their advantage, Sullivan and Simon freed former GTE marketing executive Walter Edgington of charges of illegally obtaining secret planning documents from the Pentagon.

Government investigators had reported that Edgington, confronted by evidence against GTE, told them, "You have the company by the short hairs, and I'm one of those hairs."

But Sullivan convinced a judge that classified documents were essential to the defense. The Justice Department appealed, lost and dropped the charges a year ago rather than publicly reveal the documents Sullivan demanded.

Sullivan and Simon made similar arguments in the North case, winning dismissal of two major conspiracy charges against North when the government refused to disclose secrets.

A former Sullivan associate once said of the Sullivan-Simon method: "First, they go over the ground with a fine-tooth comb. Then they scorch it."

Strategy backfired

Last fall, though, their hardball strategy backfired. Sullivan and Simon unsuccessfully defended the top executive of the Beech-Nut Co. against charges that the company sold millions of jars of phony apple juice for babies. He was convicted and sentenced to jail.

Still, Sullivan's criminal defense record is astonishing, according to unconfirmed statistics reported by David Povich, Sullivan's close friend and law partner.

"He has represented more than 100 people charged with crimes in over 18 years. Only two . . . were ever sentenced to jail — and, together, those two won't have served a total of a year," Povich said.

Right now, as he and his most famous client await the decision of the jury, Sullivan is married to the cause of Oliver North.

"A lot of lawyers are unhappy," said Washington lawyer Jacob Stein. "They want to run theaters or be cooks. Not Brendan. He's very happy."

1989 (Oct) - Passing of brother Lloyd V Edgington

Lloyd V. Edgington, 1927-1989

Robert Hall

L.V. Edgington

Dr. Lloyd V. Edgington died of cancer on October 23, 1989. The passing of a distinguished plant pathologist so soon after early retirement saddens his colleagues around the world.

Born on November 13, 1927, Lloyd grew up in Iowa and in California. He received a B.Sc. from the University of California at Davis in 1953 and a Ph.D. from the University of Wisconsin in 1956. In 1957, he started work at the Connecticut Agricultural Experiment Station and established his reputation as an expert on systemic fungicides. He joined the University of Guelph as an Associate Professor in the Department of Botany in 1965, was promoted to Professor in 1969, and moved to Department of Environmental Biology in 1971.

Lloyd's principal research objective was to determine the mechanisms of movement and modes of action of systemic fungicides used to control plant diseases. He was the first to describe the fungicidal action of the oxathin group of systemic fungicides. The rigour, excitement, and productivity of his research program were a delight and example to all of us. His lab was a constant hub of activity and a succession of technicians, summer students, graduate students, and research associates from around the world generated a wonderful cosmopolitan atmosphere. He developed an international reputation and travelled widely, often as an invited speaker, spending sabbatical leaves in West Germany in 1972 and in Berkeley, California, in 1980.

Lloyd's broad knowledge and excellent research on fundamental and applied aspects of fungal and bacterial diseases of cereals, field crops, vegetables, fruits, ornamentals, and shade trees, led to frequent invitations to assist in the work of a wide range of agricultural groups, such as the Canada Expert Committee on Cereals and Oilseeds, the Canadian Seed Growers' Association, and the honorable Eugene Whelan's Committee on IBT Pesticides.

Lloyd was the respected and beloved supervisor for over 20 graduate students, many now leaders in agricultural research, teaching, or administration. He developed a popular and demanding senior undergraduate course in Biological Activity of Pesticides and met the practical needs of the students that took his Diploma course in Plant Pathology. With his colleagues, Lloyd was friendly, open, and challenging. At their farm, Lloyd, Ruby and their family extended warm hospitality to all visitors.

An active member of the Canadian Phytopathological Society, Lloyd chaired the committee that recommended establishment of the Canadian Journal of Plant Pathology and the committee that led to the establishment of Sustaining Associates. He arranged a joint meeting of the Canadian and American Phytopathological Societies that was held in Guelph in 1984, and served as Chairman of the Local Arrangements Committee. Lloyd's outstanding service to his university, to his professional societies, to the teaching and training of students, to the scientific community, and to agriculture was recognized by numerous offices and awards. He was President and Fellow of the Canadian Phytopathological Society, Councillor of the American Phytopathological Society, and recipient of the Award of Merit from its Northeastern Division. The University of Guelph named him Professor Emeritus upon his retirement.

When colleagues attending meetings in other countries mentioned that they were from the University of Guelph, the frequent response was "Then you must know Lloyd Edgington." We remember with pride, with gratitude, and with love that it was indeed our privilege to know Lloyd Edgington.

Lloyd was an Elder, teacher, and loyal member of Duff's Presbyterian Church in Aberfoyle, Ontario. He is survived by his loving wife of 39 years, Ruby, and by his children John, Linda, Mariann, Tom, Kathie, and Sandra.

2004 (May 31) - Death

Edlow International Company

In progress... still collecting materials

History - From 2019-06-edlow-com-company-history-edlow-international.pdf / https://drive.google.com/open?id=1i9JQmS_ANV4KrMc2whCS8uwOh0BDV2ky

History

Edlow International Company traces its history back to 1957 when Mr. Samuel Edlow, the company founder, became involved in the nuclear industry. During the ensuing years, the Edlow International established itself worldwide as the foremost authority on transportation logistics, fuel cycle supply, licensing, warehousing, and other specific aspects of the nuclear business.

Mr. Samuel Edlow details some of the company's earliest years in his book Reflections of a Lucky Man. Following are excerpts:

From Junk Batteries to Spent Fuel Shipping Casks: The Birth of Edlow International Company

*"Although my father couldn't very well offer me a job in his medical practice, **my wife Frances' father had an idea**. As a scrap and junk dealer he routinely collected junk batteries from service stations, and sold them to reprocessors who removed and re-sold the lead. **Papa Schwartz, without even trying, made some pretty decent money from junk batteries.** Small peddlers would collect the batteries and sell them to him. He, in turn, would break open the batteries, recover the lead cells, and when he had a truckload would haul the lead to Indianapolis where **the National Lead Company** ran a secondary smelter. Papa Schwartz said he thought it would be a good business for me, and he would back me with the loan of enough money to buy a truck. I agreed. At the time, we didn't have a car and so when Frances and I wanted to go to a movie or somewhere we drove around town in that big truck all dressed up. We soon bought a car of our own, and moved into an apartment adequate and simple in three rooms above Doctor Salon's office.*

*For my new business I bought a lot in Fort Wayne and hired a man to break the batteries; this he did by dropping them on a thick steel plate. With my truck I drove around to the filling stations and collected batteries, for free or sometimes paying 50 cents to $1 apiece, depending on the price of lead. It became such a good business that I expanded to dealing exclusively with junkyards, where I bought whole truckloads of batteries that they had collected. **Eventually our battery-lead business took in all of Indiana, part of Ohio, and a bit of Michigan.** The time came that I was probably as big a supplier to the Indianapolis smelter as anyone.*

***As my new business grew, so did our new family. Jack, our first son, was born on March 22, 1949**, at Methodist Hospital in Fort Wayne, and Robert was born there on February 15, 1951.*

When I entered the lead business there were two commercial forms of the product: new or "primary", which is made from ore; and used or "secondary", which is recovered from batteries and other scrap-lead products.

At the Indianapolis smelter, the head of National Lead's secondary operation was Sam Hollingsworth, whose family had founded the company. Hollingsworth's assistant was Bob McKittrick and in 1954 he called me out of the blue to ask if he could come up to Fort Wayne for a visit. He told me that the Atomic Energy Commission was going to build a huge uranium-enrichment plant in Portsmouth, Ohio, down by the Ohio River; and it was going to require huge amounts of lead, both for shielding the workers from radiation and for the miles of pipes in the vast plumbing installations. McKittrick proposed that if I would open a lead supply plant in Columbus, Ohio, and get out of the battery-lead business, then National Lead would support me; help with supplies and materials, help with introductions, help with training. In this way I could become the lead supplier for that new AEC plant, and expand to any other activities I wanted to start in the Columbus area. It seemed like an ideal way to break into a business that was bound to grow with the development of atomic energy. I talked it over with Frances, and agreed.

*Now it wasn't said in so many words, but the whole purpose of the deal was that **National Lead Company controlled most of the lead operations in the Midwest, and they needed some competition to make it look respectable**. I had a reputation for being honest and efficient. It was a wonderful opportunity, and, it gave us a chance to move away from Fort Wayne, which Frances and I found to be a pleasant but provincial town. In the spring of 1954 we moved our young family to Columbus; to a new profession and a new life. We lived in that city for 16 years.*

At Portsmouth the AEC planned to construct a gaseous diffusion plant that would enrich the level of uranium-235 from its natural concentration of less than one per cent in the ore up to 3 per cent for nuclear power plants, and all the way to more than 90 per cent for use in atomic bombs. Our deal meant that I would make lead ingots for the Portsmouth plant from my Columbus operations. National Lead also sold its secondary products to plumbers, such as lead pipe, sheet lead, and solder, and they wanted me to take over that trade in the area as well. My "teachers" in the lead business were two of the most knowledgeable people around, but also two of the roughest to work with because of their degenerate lifestyles: Abe Goose, head of Cambridge Smelting in Massachusetts, and Jack Flemm, who owned Flemm Lead Company of Long Island City, New York. Every few weeks I went to New York or Cambridge to watch their operations. When I learned what I was supposed to do, Goose and Flemm provided me, on consignment, all the inventory I needed to start my own business. Both men knew the trade very well, and worked very hard – that is until 5 o'clock each afternoon. Then they broke out a bourbon bottle and began to drink, usually finishing it off in an hour or two. After that they went to a health club where they sat in a steam bath to sweat out the booze, and then they went out to dinner. The next day it was the same thing all over again. In life, you just never now who your "teachers" are going to be. But if you are open-minded and inquisitive, you can always learn something from almost anyone.

With the opportunity from National Lead, and with expertise and materials from Goose and Flemm, I founded Edlow Lead Company and opened a plant on Front

With the opportunity from National Lead, and with expertise and materials from Goose and Flemm, I founded Edlow Lead Company and opened a plant on Front Street in Columbus, Ohio, in a set of abandoned brick buildings that had once been a brewery. This was ideal for the heavy operations of a lead foundry because the factory had its own railroad siding and a loading dock for trucks. I began with three employees, an office worker and two workmen in the plant. We worked long hours, and I wasn't always home in time for dinner, but we managed to establish ourselves as a reliable, quality producer of lead products. First we installed a "pot" to melt "pig" lead, and from that we poured 25-pound ingots. With consignments from Goose and Flemm I also re-sold sheet lead, solder, lead pipe, and other lead supplies. Soon I was shipping a truck load a week to the AEC plant, and, as well, serviced the requirements of the area's plumbers. Once a week I also made a day-trip by car down to Piketon, the little town north of Portsmouth where the AEC plant was being built. It was a beautiful drive, especially on a back road along the Scioto River. I'd meet with people at the plant, maybe take them to lunch at the Lake White Club, and through this kind of careful attention my sales flourished.

Before long I expanded my business to other customers. ***In late 1955, staff from Battelle Memorial Institute visited me and advised that they were building a nuclear center in West Jefferson, Ohio, about 10 miles out of Columbus. They would need large quantities of lead shielding to protect workers from radiation, and they were prepared to work with me to teach methods for pouring high-grade lead castings. If I agreed to accept their help, I could be their sole supplier. I was quick to accept, so this brought me into an entirely new field of endeavor.***

At the time the National Lead Company, my benefactor, had a monopoly on lead bricks, which they made by the extrusion process: they melted and forced out long rods of lead, like toothpaste from a tube, then sawed the rods into brick-sized blocks. Elmer Lusk, my contact at Battelle, wondered if our lead foundry could make bricks by the casting method: melting and pouring the lead into molds. This would be a lot simpler, and a lot cheaper as well. Our challenge was to make a brick that was completely solid, because lead cools very quickly and when it cools it slumps, leaving gaps in the material. To make sure that the bricks had no gaps we made a set of a dozen cast-iron molds, which we heated before we poured in the molten lead. Then as we cooled the lead very gradually, we poured in more molten lead on the top, so that the mold was always full. In about two hours we had 12 solid lead bricks. And unlike National's extruded bricks, ours had beautifully smooth edges because the inside of each mold was evenly machine-tooled. Of course, we didn't want to under-bid National by too much, so that meant that we made more money on each brick.

Thanks to the Battelle contract, I was able to develop a method to cast lead, a process that others had ignored because of the problem with the voids from the rapid cooling. Edlow Lead Company now had a specialty product, the smooth lead bricks, but more important it had a specialty process, the lead casting technique, which I patented, and eventually licensed to three companies in Europe. Before long, Battelle asked me to cast small containers for different radioactive sources: boxes, pots, and other shapes. I'm an entrepreneur, so once I realized what I could do I decided to try to market my products to the whole nuclear industry.

The lead-casting method that I had developed was successful, and this experience made me feel, by the fall of 1956, that I was onto something important for the emerging nuclear power industry. That industry's trade group, the Atomic Industrial Forum, held a conference at the Morrison Hotel in Chicago in September 1956 and, although I didn't know it at the time, by attending I opened a door of opportunity that let me become an important pioneer in the development of nuclear technology.

Along with the Forum conference in Chicago that week was a trade fair sponsored by the American Nuclear Society at the Navy Pier, a huge exhibition area on Lake Michigan. At the trade fair I rented a small display area – really just a folding table covered with cloth and a curtain on which I hung an "Edlow Shields the World" banner. On velvet-covered stands I displayed lead bricks and lead pots I had made. We had a fancy brochure with price lists and specifications, and Frances was a nice-looking assistant there with me. We weren't there to take orders, but were just introducing ourselves to the trade. Still, we created interest, especially among the many foreign visitors.

One inquisitive American who stopped by our booth was Myron Kratzer, who worked in the international division of the US Atomic Energy Commission (AEC), the principal government agency for anything nuclear – military and civilian. Kratzer was interested in finding ways to ship nuclear materials overseas, since the United States then had an "Atoms for Peace" programs to encourage the peaceful development of nuclear technology by other countries. He sensed two things. First, at that time there was almost no nuclear-material shipment by anyone except the AEC, which dispatched radioactive isotopes from Oak Ridge. Yet the AEC knew there would be increased international commerce since the United States was positioning itself to be the supplier for the non-communist world. And they wanted to divest themselves of shipping these materials. Second, Kratzer saw that shipping spent fuel would require the use of highly specialized packaging by virtue of the extreme toxicity of the fuel itself. The high radiation levels required lead shielding of the highest integrity, and our casting methods were probably the production means required. He sensed that way down the pike I could probably be pretty good at making spent-fuel casks.

By coincidence, at university I had taken a course in Japanese Transportation, and during World War II my work as a ship's Purser taught me all the procedures involved with shipping. So I knew both the lead business and the shipping business. Myron Kratzer said, in effect, we (the AEC) need help to develop normal commercial methods for the transportation of nuclear materials. If I, Sam Edlow, worked with the AEC to develop those methods and the regulatory framework to support them, the AEC would recommend us to act as US agent for its foreign customers. It seemed mighty good to me, and I said I'd think it over.

I talked it over with Frances. She listened, she let me follow my nose, and after careful consideration I said "Yes" to Kratzer and began several months of trips to Washington. I'd drive out of Columbus on Sunday evening, arriving at the Washingtonian Motel in Gaithersburg after midnight, work at the AEC offices in Germantown for four to five days, and drive home, arriving late Friday night. This I did for about three months, and in the course of that time I helped the AEC work out the regulations they needed to assure that nuclear materials could be shipped commercially, taking into account all of the safeguards required under the Atomic Energy Act. Life itself wasn't easy by any means, but it was intellectually challenging, and, above all, it was laying the basis for what I believed would be a profitable and worthwhile business venture. From this developed – directly and indirectly – businesses that the family owns today. What luck that Myron Kratzer wandered by!

It was also through Myron that I met Curt Heidenreich, beginning a professional association and a friendship that has flourished for years. Curt was a real "European" in his outlook, and came to Washington to represent EURATOM, Europe's atomic-energy agency. When I began to pioneer the methods required for the first shipments of nuclear fuel, EURATOM soon became our largest customer. I worked with Curt's staff to set up a system that marked the status of their nuclear-material orders at each step. We helped one another in those early days, and together advanced important commercial nuclear ties between the United States and Europe.

From my work on a merchant ship I came to appreciate what a remarkable document is the bill of lading; it's a perfect contract. The signature on a bill of lading passes the financial and legal responsibility for the cargo from the shipper to the carrier. When shipping nuclear materials, the ideal situation is to use normal, time-tested transport methods – using normal commercial bills of lading, normal commercial vehicles traveling on normal commercial routes. The AEC and we used the logic as follows: because the material being shipped is highly hazardous, the packaging used to contain the material must be of such a nature that when it is presented to the transportation environment, the shipment itself must not be hazardous, not only under normal transport stresses, but also in the event of a credible accident. Whatever safeguards are required must be in the packaging, so that the result is that the package can travel by traditional transport methods.

What makes a nuclear shipment unique? First, it's a high-value item. Second, it's time sensitive, and should arrive exactly when needed, neither too early nor too late. And third, it requires special packaging. Nuclear materials are the only items that encompass all three of these qualities, therefore shipping nuclear materials requires special expertise.

Along came the Atoms-for-Peace Conference in Geneva in 1958, and I decided to show my wares there. We had licensees for our lead-casting process in England, Denmark, and Italy by then, and were ready to put to use the procedures we had worked out for the AEC. A number of people stopped by our booth to visit, and asked if we could make casks to ship spent fuel – a problem that several people in the industry were anticipating. At the conference I met John Williams from the UK Atomic Energy Authority and we brainstormed about spent-fuel shipments. We concluded that, in addition to the normal special planning having to do with nuclear shipments, the additional problem of heavy lift requirement must be considered. We formed a mutual admiration society, and from our conversations I was convinced that I knew as much as anyone about this promising business of spent-fuel transportation.

At the same conference I met Bengt Swenson from the R-2 reactor in Sweden, who told me that a colleague was then in Washington working with the supplier of their new nuclear research reactor, currently being built in Sweden. I called on him the first time I was back in Washington, and that started a close relationship which eventually let to my first order for a spent-fuel shipping cask. This allowed me to come back to the AEC and say, "O.K. I have an order. Now what do we do? What are the specific criteria we must meet in order for you to license our cask, the first to be produced by private industry?"

I had already helped the AEC write the rules for shipping nuclear materials – bills of lading and all. Now I had to design and build a cask that would meet whatever requirements the AEC would establish for proper design and fabrication for this highly specialized form of packaging. Working closely with the staff of the AEC, and, using a special group at the Battelle Memorial Institute, we pioneered the formulation of the design criteria which, to all practical purposes, still prevail today. Primarily, such a cask needed to shield the radiation and transfer whatever thermal heat was generated from within the cask. Further, a means to prevent criticality (a spontaneous nuclear chain reaction) from occurring needed to be incorporated in the cask design. The first cask turned out to be a 15-ton package, in part because of the features added to assure structural integrity.

And finally the rules were set and the first spent-fuel cask was delivered to my client, AB Atomenergi of Sweden. Over succeeding years we designed, manufactured, and delivered 39 more to various clients – in Europe, the Orient, South Africa, the United States, and even Antarctica – in sizes from 1 ton each to the famous 100-ton Yankee cask and dedicated rail car.

At the beginning, the Swedes were required to ship their material to the National Reactor Testing Station in Idaho for reprocessing. The same work could have been done at the AEC's Savannah River Plant in South Carolina. Ships bringing this fuel from Sweden discharged at Savannah, Georgia, and the cask had to cross the country on a special rail car to Idaho just because the AEC said that's where the foreign fuel should go. From an economic point of view this was ridiculous, and I negotiated with the AEC for months, and demonstrated the economic waste involved in this situation. Finally, the AEC agreed to allow my client to deliver its material to the Savannah River Plant.

Myron Kratzer took me aside and pointed out that, in fact, I had prevailed on the AEC to change a policy and I had done so on behalf of a foreign client. He said that he had no objection to my doing so, but that I should register with the Department of Justice as a foreign agent which would permit me to operate within the letter of the law. That I did. And now I found myself in a position to increase the scope of services I was able to offer to my foreign clients.

For a number of years I had no competitors in arranging the transportation of nuclear materials with the exception of Trans-Nuclear in France, and they handled only French shipments. In the making of spent-fuel casks I had a monopoly, except for one or two that National Lead and Knapp Mills manufactured, and eventually they fell by the wayside.

I've always been fascinated by one thing. During the formative years of the nuclear business so many major companies entered the field only to quit by virtue of the huge financial losses they incurred. Sylvania, American Car and Foundry, Allis-Chalmers and so many more are gone today, while the Edlow name is an integral part of the nuclear trades, reaching into every corner of the international nuclear business. There were times when we had no money at all, but nobody knew. There were times when we were quite well-to-do, and nobody knew that either.

How did I manage to survive and prosper? Most of all I attribute the fact that we were successful to good fortune. There were other reasons, but it is good fortune which helped us turn the tide so many times, and for which we can be so thankful at this stage in our lives.

It is true that being independent helped because we could take decisions quickly, we could assume risks which major corporations might find it difficult to do, we could be nimble on our feet.

Some things we did deliberately in order to give us an image of our own. I became known for not consuming alcohol. I never drank. At the Atomic Industrial Forum and American Nuclear Society meetings, most companies had hospitality suites with free booze. Not the Edlows. We served coffee and doughnuts in the morning, and ice cream in the afternoon. There is something wholesome about ice cream, and unwholesome about alcohol. These things helped promote the image of integrity, the projection of which we regularly strived for. Where other business men wore suites, Sam Edlow wore sports coats. This worked to project our image of informality and independence.

One other, and very important, factor in our ability to succeed was our insistence on becoming expert in our own very narrow field, with the result that we really knew more than anyone else in this specialized area (in part because we helped lay down the rules in the first place). But, more than anything else we thank the Good Lord for the good fortune He bestowed on us for being in the right place at the right time, with enough good sense to capitalize on a golden opportunity.

Once having designed and built spent-fuel shipping casks as our exclusive specialty we still had more than the customers to worry about. We had to educate the state and local officials who might deal with a spent-fuel shipment, including the Coast Guard, state police, and county sheriffs. This meant teaching them the use of hazard labels – chemical, toxic, or radiological – that described accurately what dangers might occur if the load were accidentally spilled. Well, it all came together by the early 1960s and we really ran the market. It was sensational.

In the end, however, I stopped manufacturing spent-fuel casks because of a financial disaster. It all happened this way. In order to encourage utilities to build nuclear power plants, the AEC agreed to buy back the spent fuel – ostensibly for reprocessing to remove useable plutonium and uranium. This was a means of subsidizing the building of nuclear power plants because the AEC never expected to actually take possession of the fuel, but it required that each utility be able to ship its spent fuel if it had to. As a way to sell reactors (and fuel contracts) Westinghouse wanted to have a spent-fuel cask built so its customers – the utilities – could say that they had access to the means of returning the spent fuel if they had to. A cask on a rail car seemed the only way to go, and I accepted the Westinghouse order, a real challenge, for a 100-ton cask in February 1962. That's the one that did me in.

In building a spent-fuel cask you have four considerations: First, shielding to protect against radiation from material in the cask. Second, a way to prevent the fuel from starting a fresh chain reaction. Third, a way to extract the heat that builds up naturally in the fuel. And fourth, structural integrity so the cask could withstand a crash. We took care of the heat by installing a water pump, and we devised a metal basket that would both prevent a nuclear chain reaction from starting, and provide a means for dissipating the heat. This involved working with a special alloy of boron and cooper for the first time in this application. We found that it was impossible to machine this particular alloy. A new method had to be developed to attain the finish desired, and the whole concept had to be re-thought. Before it was

all over I ran out of money. Well, not quite. At the end of 1962 Frances and I found ourselves with $2 in our pocket.

From this experience I realized that manufacturing was not for me. I'm an entrepreneur, and a salesman. So with all the bills paid I gave the lead company to my employees and decided to concentrate on representing clients, arranging the transportation of nuclear materials, and supplying uranium. In order to earn some income I thought of driving a cab, but Frances suggested that with all my business trips to Europe I'd make a fine travel agent. And I did.

Meanwhile, I continued my nuclear shipping and trading business, Samuel Edlow – Traffic Management of Nuclear Material, from a small office in Columbus, and before long I had an efficient – but exhausting – routine. Every Sunday night I drove about eight hours to Washington, and checked into the Washingtonian Motel in suburban Gaithersburg, Maryland. On Monday, Tuesday, and sometimes Wednesday I called on the AEC in Germantown or on client's downtown. Then I hopped in the car and drove back to Columbus, ready for work at the travel agency from Thursday to Saturday. It was a crazy, hectic time, but gradually I expanded my contacts and became an important player in the business.

All the while Frances encouraged me, and spent most of her time raising our two fine sons. Jack graduated from high school in 1967 and obtained his BBA in International Business at The George Washington University. Robert graduated from high school in 1969 and was awarded a four-year certificate for art study at the Corcoran Gallery in Washington.

In the late 1960's Charles Lazarus, head of a department-store chain, offered me a handsome salary to set up travel agencies in all his stores. But my heart was in the nuclear business, and with encouragement from Frances I stuck it out – eventually spending so much more time in Washington than in Columbus that it seemed clear to me and to my clients the capital was the best place to do business. ***In June 1969, on the day after Robert graduated from high school, our family moved to Washington.***

Beginning with a three-room office at 1100 17th Street NW, a secretary, and Jack as my assistant, I founded Edlow International Company (EIC) to offer a variety of brokering and transportation consulting and uranium-supply services to nuclear clients. *The secret of our success was to start small and to grow conservatively, always financing expansion from profits, not from borrowing. And grow we did. By the time our office moved to larger quarters at 1815 H Street NW, EIC was the dominant shipper of nuclear material in the world.* ***We expanded to 1666 Connecticut Avenue in 1988, again increasing our staff and our operations.***

By being alert to new opportunities, and by remaining flexible, we were able to pioneer several impressive achievements in the nuclear business over the years. For example, we arranged for the first international commercial spent-fuel shipment. We arranged the first commercial heavy-water shipment. We arranged the first plutonium shipment to EURATOM, the European nuclear consortium. We arranged the first nuclear-material sale and shipment that required an executive order from the President of the United States – for the Tarapur reactor in India. We designed, built, and delivered the first commercial spent-fuel casks. We handled the first nuclear-component order for China. We arranged the first import license for natural uranium hexafluoride. And we obtained the first federal license to store natural and enriched uranium. All these accomplishments are really satisfying, and contributed to the growth of an entirely new international industry."

Ginna plant plutonium fuel shipment opposed

A Wisconsin congressman yesterday urged that the U.S. Nuclear Regulatory Commission stop importation of a nuclear fuel to be used in Rochester Gas & Electric Corp.'s nuclear plant in Wayne County.

In a letter to commission chairman William Anders U.S. Rep. Les Aspin asked that the federal license issued to Edlow International (a Washington firm) to import the mixed-oxide fuel plutonium, be withdrawn on environmental grounds. The Democrat congressman, an outspoken environmental critic, charged that transportation of the plutonium is dangerous and said the corporation doesn't have a license to use the fuel.

Richard Peck, coordinator of press relations for the corporation said it must test the fuel before applying for a license.

"This is just the way it's done," Peck said. 'Before you can apply for a license for that particular plutonium, you have to know what's in it.

"We certainly have no intention of loading pure plutonium into our reactor before we have a license to do this."

Peck added that the issue is "right up in the air" now because the British firm from whom the fuel had been ordered last week said the plutonium is unavailable.

"RG&E does not have a license to use mixed-oxide fuel and . . . cannot receive one before the completion (by the Nuclear Regulatory Commission) of the Environmental Impact Statement process," Aspin said in the letter. But he emphasized that the greatest environmental danger would occur in the transport of the fuel.

"Thus the full environmental impact of this shipment of plutonium will be felt, whether or not a license is eventually granted to RG&E to use the substance in its reactor," he said

Peck said, "There's certainly two different factions far apart on the dangers of plutonium: He said the fuel has been used for many years.

Aspin said court decisions involving the National Environmental Policy Act indicate it may be illegal for an agency to permit importation of plutonium for an end use for which no permit exists.

A commission official said Edlow International was granted an import license on Feb. 12 to import from England 130 kilograms—about 290 pounds—of plutonium oxide. The firm's application said the end purpose of the importation was to supply fuel for the Gianna plant.

Peck said the Rochester corporation plans to import the plutonium when it becomes available. He said the fuel is reusable and would cut down on the firm's depletion of uranium resources.

Washington D.C. Engagement Of Interest Here

Mr. and Mrs. Gerald A. Wright are announcing the engagement of their daughter, Diane, to Herbert N. Harmon.

Miss Wright is a 1965 graduate of Lancaster High School and a 1972 graduate of The Ohio State University. She is presently associated with the firm of Edlow International Co. as a nuclear shipping consultant.

Mr. Harmon, a 1973 graduate of Georgetown University Law School, is associated with the practice of criminal law for the District of Columbia.

Their wedding will take place in the Georgetown University Law School Chapel on August 2. The couple will reside in Washington D.C.

DIANE WRIGHT HARMON

Radioactive cargoes called safe business

By JOSEPH S. HELEWICZ

Diane Harmon contends she could "tap dance atop a cylinder of radioactive material" if ever challenged to demonstrate that packaging and transporting hazardous cargoes is a safe business.

If such a challenge were to be issued, it likely would come from within Baltimore, for according to Mrs. Harmon, who is an executive of Edlow International Company, no other port in the country is handling the volume of radioactive material that currently is being shipped through here.

The Washington executive's primary responsiblity is booking ships to transport new and spent radioactive materials to and from the United States, but Mrs. Harmon said her time also is dedicated to dispelling what are termed "normal" fears concerning the handling of hazardous cargoes.

"Mention 'radioactive material,' " Mrs. Harmon said, "and the first thing the public thinks of is a mushroom cloud. There is little understanding of how it is handled."

Addressing members of the Baltimore Propeller Club yesterday, Mrs. Harmon detailed the complex procedures involved in shipping harzardous cargoes, and the stringent regulations imposed by the federal Department of Transportation Atomic Energy Commission and the Coast Guard governing those shipments.

"There's no risk involved when the materials are properly packaged," Mrs. Harmon explained, "and a bill of lading always states when the procedures have been followed."

Apprehension toward the hazardous cargo shipments, and apparently bureaucratic red tape, were reasons that Edlow International recommended to its foreign and domestic clients that they shift their shipping business from the port of New York to Baltimore.

"Baltimore does not have those problems," Mrs. Harmon said. "It has clean, clear operations and most important is the speed of ship turnaround [the amount of time it takes to load and discharge a ship's cargo.]"

Nuclear Fuel for India Protested

WASHINGTON (AP)—Three environmental and public interest groups today filed petitions with the government in an attempt to block a proposed export of U.S. nuclear fuel to India.

The move marked the first time public groups have intervened in an NRC licensing proceeding concerning nuclear exports.

At issue is some 40,000 pounds of uranium fuel which Edlow International Corp. is seeking to ship to India's Tarapur Atomic Power Station, near Bombay.

The three groups contended that present safeguards are inadequate to insure that India will not divert it to manufacture of nuclear weapons—as India did to produce its first nuclear device, exploded in May, 1974.

Sierra Club wins U235 export review

WASHINGTON — In an unprecedented move, the nuclear regulatory commission has decided to hear views of environmentalists and scientists trying to block the export of low enriched uranium U235 to India.

The June 3 public hearing was requested by the Sierra Club, the Natural Resources Defense Council, and the Union of Concerned Scientists.

The commission said the organizations "have shown no legal right to intervene in the commission's consideration of the applications and to have a trial-type hearing."

Nevertheless, the commission said, it "concluded that an open public hearing of the type conducted by congressional committees in considering similar matter was appropriate in the circumstances."

The organizations object to the export of uranium to India because of the danger of nuclear proliferation, possible health hazards in India from operation of the Tarapur nuclear station near Bombay, and the need for more information.

As agent for the Indian government, the Edlow International Co. is seeking permission to export 546.44 kilograms of low enriched U235 uranium to India's atomic power station in Tarapur, 60 miles north of Bombay, a facility built by the International General Electric Co.

U.S. Commission OKs Uranium for India

WASHINGTON (UPI)—The Nuclear Regulatory Commission granted an export license Friday for the shipment of more than 10 tons of enriched uranium to India for use as atomic power reactor fuel.

The commission delayed a decision on a second license for an even larger shipment until after a public hearing July 20 on the adequacy of U.S. steps to keep India from turning the uranium into nuclear explosives.

India is said to plan using the uranium for two 200-megawatt General Electric reactors at the Tarapur atomic power station, which provides much of the electric power in the Bombay area.

NRC Chairman Marcus Rowden and commissioners Edward Mason and Richard Kennedy said their approval of the smaller license was based on "the urgency with which this license is required by the government of India and the need to avoid, on the part of the United States, undue adverse impact on U.S. foreign policy."

In a dissent, commissioner Victor Galinsky noted that India had nearly completed a reprocessing plant for spent reactor fuel and expressed doubt that there were "genuinely effective safeguards" to keep the Indians from making nuclear weapons with plutonium from the plant.

Gilinski added: "The need for effective safeguards over reprocessing and subsequent storage of separated plutonium is particularly acute in this case, given India's continuing nuclear explosives program and India's failure to renounce the use of such explosives as weapons through ratification of the nuclear nonproliferation treaty."

Plutonium, from which hydrogren bombs are made, is one product that can be obtained when spent uranium fuel from a reactor is reprocessed.

The license approved by the commission allows Edlow International Co. of Washington to provide India with 20,207 pounds of uranium enriched to form relatively low-grade reactor fuel with 2.71% of the isotope U-235.

The second license application, on which the commission delayed, is for 27,031 pounds of uranium enriched to the same degree.

Former U.S. Official Warns of India's A-Bomb Capacity

WASHINGTON (UPI)—A former top official of the U.S. Arms Control and Disarmament Agency warned today that an atomic power station in India is producing enough plutonium to build 10 to 20 nuclear weapons every year.

Herbert Scoville Jr., former assistant director of the agency, opposed further sale by the United States of uranium to India in the first adversary proceeding ever held before the Nuclear Regulatory Commission.

India developed and exploded an atomic bomb in 1974.

"While it is probably now too late to reverse the Indian decision to have an embryonic nuclear explosive capability, it is still timely for the commission to take steps which will limit this capability and prevent its becoming a major military force at an early date," he testified.

In two days of hearings opening today, the commission is weighing the sale of 12,251 kilograms of low-enriched uranium by Edlow Corp. of Washington to India for use in the Tarapur atomic power station.

The uranium India wants would be used as reactor fuel, and plutonium could be obtained as a byproduct through reprocessing the spent fuel from the reactors. Plutonium is the material used in the hydrogen bomb.

Scoville said that, even after India exploded its first atomic device, the United States continued to supply fuel for the station.

He said the station is producing plutonium at the rate of 100 kilograms per year and already has about 400 kilograms of plutonium stockpiled. One hundred kilograms is enough to produce 10 to 20 nuclear weapons, he said.

Scoville warned that U.S. transactions with India would be watched by all potential nuclear weapon nations. "All other nations contemplating such a move will be influenced by the success of the Indian action," he said.

"Continued U.S. supply of fuel to India, even with a guarantee that the plutonium will not be used in an explosive program, will convince them the United States is not serious about halting proliferation."

U.S. Reactors for Israel, Egypt

WASHINGTON (AP)—Negotiations for the sale of nuclear power reactors to Israel and Egypt have been completed, the State Department said today. The announcement came only 24 hours after disclosures that American assistance had contributed to India's 1964 atomic blast.

Delivery of the Israel and Egypt energy-generating systems is planned for the mid-1980's, and safeguards on their use will be stricter than normal international controls.

These will be the first reactors supplied to Israel and Egypt by the United States. The Israelis have a reactor in use, however, provided by France.

Nuclear pushers. America squirms

Frank Rutter *Mr. Rutter is The Sun's Washington correspondent.*

WASHINGTON — Recent hearings by the U.S. Nuclear Regulatory Agency on the export of enriched uranium to India raised disturbing questions about U.S. policy in this potentially lethal game.

But the fact that two days of public hearings were held — the first ever — served a useful purpose in providing public information and public debate.

The U.S. state department turned in a virtuoso performance combining masterful obfuscation with elliptical rationale in its efforts to support sale of nuclear fuel to the country which had already produced the bomb with the aid of Canadian and American technology and materials.

Even the fact that India has nearly completed new processing facilities which will enable it to make more ingredients for nuclear weapons failed to deter the state department from its narrow view that this particular export would not affect India's bomb-making potential.

The thrust of the state department's arguments appeared more to constitute attempted justification for past agreements with India on nuclear safeguards and to deny that these agreements had been violated than to ensure that India would not do it again.

If the diplomats want to feel safe in the language of their agreements with India, the rest of us can take no consolation from the facts.

These are, as is well known, that India produced its nuclear explosion by means of the Canadian "Cirus" reactor and possibly with the use of American fuel; and that India could easily do it again.

Yet the state department focused almost entirely on the narrow issue of whether a new shipment of fuel to a particular power station (Tarapur) was adequately safeguarded.

Oh, the department did raise some general questions. For instance, it insisted that it was no use trying to "coerce" India into compliance with the international non-proliferation treaty, which it won't sign; and that if it were to sign, which is unlikely, it would be because the U.S. had very kindly continued to supply nuclear assistance.

"The credibility of the U.S. as a reliable supplier of nuclear materials, equipment and services is an essential element in achievement of our non-proliferation objectives," the department said.

Of course, the credibility of India, which exploded a nuclear bomb in the Rajasthan Desert in 1974, wasn't taken into account at all. Not to mention the fact that internal conflict has rendered the country into a mere figment of democracy.

Denial of this particular shipment of 12,261 kilograms of uranium hexafluoride, "would cause a major setback in our relations with India," the state department said. So, it was all right that India got the bomb and that Indira Gandhi imposed a police state?

Perhaps the state department is quite correct in assuming that the fuel destined for Tarapur would never be used to make plutonium for a bomb. After all, the reason for this, according to the state department, is that India already has accumulated "large, unsafeguarded sources of plutonium".

Of course, the blame for this, as implied by the state department, is the termination of Canada's nuclear assistance program, thus freeing India from international safeguards attached to that program.

One of the questions raised repeatedly during the hearings of the NRC was the capability of the U.S. to insist that India's spent fuel stockpiles, material already used for power purposes, should be returned to the U.S. for reprocessing rather than be allowed to pile up for reprocessing in India.

In fact, it turns out, the U.S. has consistently refused to take back this fuel. This, of course, can be calculated only to encourage the Indians to build their own reprocessing facilities, which they have done.

There is, in addition to this convoluted U.S. government policy, an underlying pressure from commercial interests to continue nuclear fuel exports. Such pressure was a major factor in Canada, although it was the government that was the promoter of nuclear trade there.

The company which would actually export the fuel to India, Edlow International, warned in a letter to the NRC that it faces "serious financial penalties" and of "capricious" and "irresponsible" delays causing "incalculable damage to the credibility of the U.S."

The motivation and loyalty of commercial companies, however, can be seriously questioned in the light of correspondence between the U.S. government and Vitro International of New York, one of the concerns involved in 1963 in the design of an Indian reprocessing plant near Bombay. The company told the U.S. that it could not provide information on the plant because it had been forbidden to do so by the Indian government.

It is also interesting that President Gerald Ford is currently trying to get the U.S. Congress to pass legislation giving private industry a much bigger hand in the production of nuclear fuels.

One of the major impressions to emerge from the NRC hearings is that U.S. policy on nuclear proliferation is confused and confusing.

Even though the hearings were a showcase and, conceivably, could result in refusal of a licence to export one particular shipment of enriched uranium to India, the NRC, without a blush, had already granted the Edlow company an export licence on July 2 (just a few days before its hearings) to send 9,165 kilograms of uranium hexafluoride to the Tarapur plant in India, enough to keep it going pending consideration of the second, contested, shipment.

Fortunately, Democrat Jimmy Carter, whose prospects for becoming president after the November election are excellent, has exhibited a strong interest in tackling nuclear proliferation.

In a speech at the United Nations in May, Mr. Carter warned that by 1990, the developing nations alone will be capable of producing enough plutonium to make 3,000 Hiroshima-size bombs a year.

He called for a comprehensive treaty banning nuclear testing for any purposes and a worldwide moratorium on the purchase or sale of nuclear reprocessing plants, at least until inadequate international safeguards and standards are improved.

Mr. Carter said a lot more, including the bold assertion that "the hour is too late for business as usual, for politics as usual or for diplomacy as usual. An alliance for survival is needed."

A lot happens to a candidate and his promises between a campaign and actually taking office, so it remains to be seen whether Mr. Carter, if elected, will straighten out policy on nuclear proliferation.

But perhaps he will recall his personal experience as a nuclear engineer, which included, he says, helping to disassemble a damaged nuclear reactor core at Chalk River, something which alerted him to the dangers of messing with nuclear power. India, however, alerted the world.

Transportation of Nuclear Wastes Poses Security Problems

(EDITOR'S NOTE: This is the fourth in a six-part series.)

By JOHN FIALKA
(c) Washington Star

WASHINGTON — About 20 times a year, a low-key drama is played out somewhere in the United States. A rented armored car rolls out of one of the government's three uranium enrich-

highly enriched uranium of plutonium.

The armored car crews are required to be in continual contact by radio-telephone with the shipper, according to NRC regulations. To meet this requirement, Edlow International places a Burns guard near a spe-

mally used in small, experimental reactors. (With the exception of the West German plant, most power reactors use a lower grade uranium that cannot be used for weapons.)

Since 1954, when the United States began its Atoms for Peace program, 27 tons of SSNM have

begin to recycle plutonium that is created in the spent fuel of power reactors. They also have plans to switch over to new "breeder" reactors that will create quantities of plutonium-based fuel.

At the moment, however, very little is moving. The United

figure jumped to three and, a few days after the Chicago incident, to four.

Last October, ERDA took a major part of the domestic SSNM business away from the private shippers. Since then, nearly all shipments of highly enriched uranium to users in the

are moving fortresses that automatically disable themselves if attacked.)

Overseas, the United States has been trying quietly to impose the new levels of physical protection on other nations, especially those who import weapons-grade nuclear materials

security plans for its whole life span."

General Accounting Office investigators who followed an ERDA inspector to Italy wrote that security at some facilities was found to be "very lax." One storage area containing portable containers of highly enriched

used "chicken wire" cages to protect canisters of bomb-grade nuclear materials. (The GAO report, issued on Feb. 9, 1976, was stamped "confidential" by the State Department. A copy, however, was obtained by The Washington Star.)

According to Hudgins, most of the deficiencies in storage fa-

ment facilities and heads for a major airport where a chartered jet stands ready to fly its cargo overseas.

On Feb. 8, the drama was played out at Chicago's busy O'Hare Airport, when an armored car pulled into the Lufthansa warehouse area. A contingent of three Pinkerton guards, carrying sidearms, was waiting as the first of 52 steel drums weighing 288 pounds was unloaded from the truck.

Their mission: To guard the largest private shipment of highly enriched uranium in history. According to experts, the shipment, en route to a nuclear power facility in Germany, contained enough material to make 10 atomic bombs.

Among the many problems surrounding the proliferation of nuclear materials and technology in the world, the problem of physical protection is generally conceded by the experts to be the most troublesome. The weakest link is the transportation system which, at the moment, is a hodgepodge of diverse, frequently uncoordinated systems.

Making More Secure

In the United States, transportation of nuclear materials has been left largely to the discretion of private shippers and their rented guards since the traffic began in the early 1960s. But in the past two years the two federal agencies involved, the Nuclear Regulatory Commission and the Energy Research and Development Administration, have begun working feverishly, trying to tighten security as incidents of terrorism have increased throughout the world.

Their fear, as a joint ERDA-NRC task force stated last summer, is that somewhere there may be "determined violent assault by well-trained assailants armed with hand-held automatic weapons and assisted by an insider."

The risk of bomb materials falling into the hands of organized terrorists or operatives of unfriendly, non-nuclear nations, makes the shipment of weapons-grade nuclear materials dramatic. If it happens anywhere in the world, it could be a problem for the United States.

This awareness makes the regulatory authorities jumpy. So it was that as the three armed Pinkertons — two men and a woman — took their positions to watch the unloading of the uranium in Chicago, at least 10 other men took their positions in the warehouse. Their mission was to watch the guards.

Several Agencies Involved

At least four of them were NRC inspectors. Another three were from a special unit, the office of Nuclear Material Safety and Safeguards (NMSS), which the NRC uses to probe for weaknesses in security. Two more were NRC researchers, assigned to come up with new ways to upgrade security systems. One was a U.S. Army security analyst who was going to fly with the shipment to Germany.

According to sources who attended NRC briefings after the incident, the Pinkertons sometimes acted in an "extremely casual manner," sometimes failing to require or check identification badges, occasionally appearing confused because so many inspectors and researchers were wandering around in the cargo area. "At times it must have been difficult to figure out who was in control of this operation," said one NRC source.

Sometime during the evening, one of the NMSS security probers, dressed in a parka similar to those worn by the warehouse workers, entered the warehouse area through another airline's gate and strolled onto the partially loaded cargo plane along with the plane's flight crew. There, he began taking pictures.

Kenneth R. Chapman, head of NMSS, admitted that there was a "certain casualness about checking badges" but asserts that was no threat to security. "I work in a secure area and sometimes I don't wear my badge around here either," he told a reporter.

'Loading Went Smoothly'

Despite the alleged violations, Bill Teer, vice president of Transnuclear Inc., the shipping company that hired the Pinkertons, insists that the loading "went very smoothly."

In the United States, the business of moving weapons-grade materials for export is shared by two private companies: Transnuclear Inc. and Edlow International. They function as booking agents for foreign governments and utilities. They obtain the export licenses and arrange security and transportation to the major airport nearest to the government facilities that make

cial telephone in a downtown Washington office building.

It takes about 33 pounds of highly enriched uranium or 9 pounds of plutonium to make a bomb. In the trade, that amount is called a "trigger quantity" or "SSNM," for Special Strategic Nuclear Material. At the moment, these materials are removed from this country throughout the world, according to statistics recently released by the Senate Government Operations Committee.

Within the next few years that figure may jump significantly, into the hundreds and thousands of tons as England, France, Japan and several other nations

plier in the past, has been holding up export licenses while it attempts to tighten what controls it has over protection systems here and abroad.

On the transportation side, the change is quite noticeable. Until recently the NRC required only two hired guards to guard an SSNM shipment. Then the

mored trailers designed by the Defense Department for hauling nuclear weapons.

The trailers are manned by specially trained ERDA guards using Defense Department communication systems and carrying semiautomatic weapons. (The vehicles, designed to look like a regular semitrailer truck,

Since 1974, when the risk of terrorist activities began to be weighed more seriously, U.S. inspectors have been dispatched to nuclear facilities in 34 countries. According to Vance Hudgins, head of the ERDA unit involved, the new policy is that "no more trigger amounts should be shipped unless we see

open door, slightly ajar. The report said, "...officials explained that the door was always unlocked because it was an emergency exit."

Another facility's storage area found to be near an open window. A third facility had "large, metal double doors which were left ajar," and a fourth facility

cilities examined overseas have been corrected. "This has been one of the most successful programs we've ever been involved in. No one wants to be the first country that has a successful first terrorist incident," said Hudgins.

U.S. to supply uranium to India; warns against using it for bombs

1977-07-30-the-des-moines-register-pg-16-a

WASHINGTON, D.C. (AP) — The U.S. Nuclear Regulatory Commission (NRC) said Wednesday it has approved the export of 27,000 pounds of uranium to fuel India's Tarapur Atomic Power Station.

But the NRC emphasized that further U.S. shipments of nuclear fuel for the Tarapur plant would be cut off if India explodes any more nuclear devices.

The United States has shipped nuclear fuel to Tarapur before, but the shipments were challenged Mar. 2, 1976, by three citizen groups — the Natural Resources Defense Council, the Sierra Club and the Union of Concerned Scientists.

India exploded a nuclear device in 1974, partly with the aid of "heavy water" provided by the United States for other purposes.

The citizen groups argued that India could not be trusted to use uranium fuel shipments only for peaceful purposes.

They challenged an application by the Edlow International Co. which, as later amended, asked to export 306.61 kilograms (about 674 pounds) of uranium-235, contained in 12,261 kilograms (about 26,974 pounds) of uranium.

Uranium-235 is a rare type which splits spontaneously, releasing energy and splitting additional uranium atoms in the process.

In approving the nuclear fuel shipment to Tarapur, a powerplant in the Bombay area, the NRC noted that the Department of State had informed the Indian government of the new U.S. nuclear policy that ruled out future nuclear cooperation with a nonnuclear weapons state that detonates a nuclear explosive device.

"This step has put the Indian government on unequivocal notice," said the NRC, "that, even if India explodes a weapon arguably constructed with entirely indigenous produced materials, utilizing technology not directly received from the United States, the United States government has announced its intention to terminate the supply of fuel to Tarapur."

Discussing points raised by the citizen groups, the NRC noted that the Indian government has agreed in principle to have the United States repurchase spent nuclear fuel from Tarapur, as a safeguard against the conversion of that spent fuel into weapons materials.

The NRC said although the negotiations were continuing, there was no need to withhold the Tarapur fuel shipments until they were completed.

As for the "heavy water" supposedly used by India in the preparation of its 1974 nuclear explosive device, the NRC said that material was not covered by the anti-weapon safeguard agreements which now apply to the Tarapur fuel.

"Heavy water" has the same chemical composition — hydrogen and oxygen — as ordinary water, but its hydrogen atoms are heavier than normal. It is not a nuclear explosive material, but is used to control reactions in which nuclear explosives are manufactured.

Power plants not affected

Tighter security asked in shipping nuclear fuels

1977-07-07-the-courier-journal-pg-1 and a12

By STAN BENJAMIN
Associated Press

WASHINGTON — The Nuclear Regulatory Commission has proposed tightening security to protect nuclear fuel plants and uranium and plutonium shipments against sabotage, theft and terrorism.

Regulations published in Tuesday's Federal Register would sharply increase guard forces for high-grade uranium and plutonium, both in storage and transit.

They also would impose, for the first time, a requirement that private guards hired by commercial nuclear operators and shippers must be certified in good mental as well as physical health.

Companies handling nuclear materials, now could, without violating current commission standards, hire someone who was insane to guard nuclear materials, a commission spokesman confirmed.

The proposed rules also would increase the requirements for people guarding nuclear shipment to stay in contact with fixed security bases that could summon help if necessary.

The proposed regulations do not apply to nuclear power plants. The rules would apply to a dozen nuclear fuel facilities operated by nine companies licensed by the commission and to three companies licensed for nuclear material transportation.

The Nuclear Regulatory Commission and the U.S. Energy Research and Development Administration, the two agencies created out of the Atomic Energy Commission in 1975, had concluded last year that security measures for civilian nuclear activities needed improvement.

Organized terrorism in recent years has focused new attention on the possibility that nuclear fuels could be stolen and fashioned into nuclear bombs or dispersed in crowded areas to expose people to radiation.

The Natural Resources Defense Council, an environmental group, asked the Regulatory Commission to tighten security measures on an emergency basis. Last January, the commission decided to speed its process of making rules to improve security.

Current rules require the companies to prepare for an attack by "several persons." The proposed rules would require defenses adequate to hold off coordinated, separate attacks by trained, dedicated teams of terrorists armed with weapons and explosives.

One set of proposals would stiffen requirements for guards, adding the mental health standard, improving physical fitness standards and requiring training in handling weapons and annual tests in proficiency.

The other set would increase the physical security required for nuclear installations and shipments.

The proposals would:

- Require nine armed guards for major shipments of uranium or plutonium by road, with two or three bulletproof escort vehicles. The cargo vehicle would have to be a locked, sealed safety vault on wheels.

Currently, two armed guards are required, with one escort vehicle and no requirement of bulletproofing.

- Require guards to call a home base every 30 minutes. Current rules require guards to call in every two to five hours.
- Require three armed guards with each air shipment and at least nine armed guards at all scheduled refueling stops. Current rules require one unarmed escort and no guards at refueling stops.
- Require nine armed guards on rail shipments with calls every 30 minutes to their control center. Currently, rail shipments require two armed guards who call in every two hours.
- Require for shipments by sea the use of "container ships" in which cargo is pre-packaged in large, sealed container units. This is not now required.
- Require on sea shipments three armed guards who would call control bases by ship-to-shore radio every six hours. Now, one guard who checks in once a day is required.
- Require guards for air and sea shipments who can speak the same language as the vessel's captain. Under current rules, the security escort of a nuclear shipment does not have to be able to converse with the captain.

Proposed rules for fixed nuclear installations, such as fuel plants or fuel fabrication and reprocessing plants, list detailed measures to make guard posts and alarm stations more effective and to limit access to uranium and plutonium storage areas.

For both fixed sites and shipments, the proposals would require more backup communications systems and separation of guard posts so that a single attack could not cut off calls for help.

There was no indication when the commission would be able to adopt the new security rules. The agency is one new security rules. The agency is one commissioner short of a quorum and cannot take formal actions.

The affected facilities are licensed to handle "strategic quantities of special nuclear material," meaning large amounts of fissionable uranium and plutonium according to a formula set up by the commission. They are:

- Atomics International at Canoga Park, Calif.
- Babcock and Wilcox, Nuclear Materials Division at Apollo, Pa., and Parks Township, Pa.; and Naval Nuclear Fuel Division at Lynchburg, Va.
- Exxon Nuclear Co. at Richland, Wash.
- General Atomic Co. at San Diego, Calif.
- General Electric Co. at Vallecitos, Calif.
- Nuclear Fuel Service at Erwin, Tenn.
- Texas Instruments at Attleboro, Mass.
- United Nuclear Corp., Naval Products Division at Uncasville, Conn., and Fuel Recovery Operation at Wood River Junction, R.I.
- Westinghouse at Cheswick, Pa.

The three companies licensed to transport "strategic quantities" are:

- Tri-State Motor Transit of Joplin, Mo.
- Transnuclear Inc. of White Plains, N.Y.
- Edlow International Co. of Washington, D.C.

Nuke fears unfounded

If thinking about nuclear wastes keeps you awake at night, recent exhumations in Raleigh might make you feel a little better.

Some residents of Purlear were concerned that leakage from a nearby nuclear waste disposal had killed local animals. The residents asked the N.C. Department of Agriculture to exhume the bodies of a dog and three cows to see if the animals had died of radiation poisoning.

The results of an autopsy on the animals showed no evidence of radiation exposure.

Purlear residents still aren't happy about the Wilkes County plant. They've petitioned Gov. Jim Hunt to close it.

NRC considers ports

Both Wilmington and Morehead City are being considered as ports of entry for foreign nuclear wastes. The Nuclear Regulatory Agency is considering Wilmington, and Washington-based Edlow International, a private firm, is checking out Morehead City.

Edlow said about 12 shipments a year would be made into the port selected. The nuclear wastes would then be shipped overland to a plant near Barnwell, S.C.

Charleston, S.C., and Savannah, Ga., are also being considered as possible sites for entry.

The Times SHREVEPORT-BOSSIER CITY Sat., Aug. 25, 1979

2 ports closed to overseas nuclear waste

RALEIGH, N.C. (UPI) — State officials have closed the ports at Wilmington and Morehead City to shipments of nuclear wastes from overseas.

William A. Green, executive director of the state Ports Authority announced the decision in a letter to officials of a New York firm that had expressed an interest in using the ports, but spokesmen said Friday the decision was not Green's alone.

"It's the state's decision. Gov. (James B.) Hunt supports it," Steve Meehan, a spokesman for the state Commerce Department, said.

The shipments are part of a 1954 agreement in which this country provides foreign nations with high-grade uranium for research purposes and takes the spent uranium back for reprocessing.

The return of the material is partially intended to keep the material out of the hands of terrorists. Most foreign nations also lack the ability to reprocess the high-grade uranium.

Green's letter was written Thursday in response to an inquiry to ports officials earlier this month from John Mangusi, president of Transnuclear of White Plains, N.Y., Meehan said.

Green discussed the inquiry with "the appropriate state officials," Meehan said. "(Commerce Secretary D.M.) Lauch Faircloth told Green to call them and tell them 'no' and to follow it up with a letter."

In the letter, Green said, "Please be advised that we do not want North Carolina's ports utilitized for this purpose.

North Carolina ports are the latest to be closed to nuclear shipments, said Jack Edlow, head of Edlow International of Washington, D.C., a nuclear shipping company. Florida began the process by closing its ports, followed by Savannah, Ga., and New York.

Nuclear Waste Shipments Given Permanent Approval

PORTSMOUTH (UPI) — The Nuclear Regulatory Commission has granted permanent approval for the shipment of nuclear waste from Europe through this port city.

The federal agency agreed with two trucking firms that there are no viable alternative East Coast ports for the entry of the highly radioactive cargo, Robert Burnett, director of the NRC's safeguard division said.

Transnuclear Truck Lines of White Plains, N.Y., and Edlow International of Washington, D.C., had examined about a dozen other ports, but reported most had ordinances prohibiting shipping of the material.

Anti-nuclear groups have unsuccessfully attempted to have similar ordinances adopted in this city of 118,000 residents, but local officials have refused, satisfied with federal safeguards and pleased with the trade revenue.

"Transnuclear and Edlow successfully proved there were no pratical alternative," Burnett said.

The NRC granted final approval in a letter mailed to both companies Wednesday, he said.

NRC won't OK shipment of N-parts to India reactor

WASHINGTON, D.C. (AP) — Despite the State Department's favorable recommendation, the Nuclear Regulatory Commission refused permission Friday for exports of nuclear fuel and replacement parts to India's Tarapur reactor, and sent the case to President Carter for a final decision.

Carter could overrule the NRC and allow the exports.

The five-member NRC, in a unanimous decision, said "the commission's inability to issue these licenses should not be read as a recommendation one way or the other on the proposed exports.

"Rather, we have found that the particular statutory findings with which the NRC is charged cannot be made."

Before permitting a peaceful nuclear export, the NRC is required by the Atomic Energy Act to make sure it will be safeguarded under international rules against diversion into the manufacture of nuclear weapons, and will not be transferred to some other country without U.S. permission.

The NRC said it could not conclude, "based on a reasonable judgment of the assurances provided by the government of India and other information available," that the Tarapur shipments would meet those tests.

But it noted that Congress had authorized the president to clear nuclear exports by executive order if he decided that withholding them would jeopardize national security or hamper U.S. efforts to impede the spread of nuclear weapons.

The United States has exported low-enriched uranium, as nuclear fuel, to the Tarapur nuclear power plant in the past.

After India set off a nuclear explosion described as a "peaceful nuclear experiment" in 1974, however, continued shipments for refueling became controversial.

In its recommendation May 7, the State Department expressed concern that India's Prime Minister Indira Gandhi "has not ruled out the option of so-called peaceful nuclear experiments, should this be considered to be in India's interest."

"However," the department added, "we do not believe that withholding the pending export would advance U.S. interests" in stemming the spread of atomic weapons.

At stake were a series of export license applications submitted by Edlow International Co., acting as agent for the Indian government, for two shipments of low-enriched uranium of 19,858.2 kilograms (about 43,689 pounds) each, plus spare parts for the two nuclear units of the Tarapur plant.

Each uranium shipment would represent about one year's nuclear fuel supply.

C2 International Wednesday, April 14, 1982 Saskatoon, Saskatchewan Star-Phoenix

Nuclear spending increase sought

WASHINGTON (AP) — In the midst of growing congressional and public support for a nuclear weapons freeze, President Reagan quietly is asking Congress for another $400 million so the government can build more nuclear bombs in 1982 and 1983.

The president's spending request, which drew almost no attention when it was announced March 29, came on the same day that 13 House members introduced a resolution calling on the United States and Soviet Union to negotiate a gradual reduction of nuclear armaments.

One day later, the president gave general support to a Senate resolution calling for a gradual nuclear arms reduction. The House, meanwhile, held an unusual evening debate that day on the merits of an immediate U.S.-Soviet freeze.

The spending increase sought by Reagan would be on top of a $1-billion rise in spending on atomic bombs in 1982, which Congress has approved, and an additional $800-million increase Reagan wants in 1983.

Mounting support among the public and in Congress for a nuclear weapons freeze "makes them (the administration) want to build these things even faster," one Senate source familiar with the proposed increase said Tuesday.

"If they think the program is threatened, they want to get it started as soon as possible before it's cut off," said the source, who did not want his name used.

Reagan specifically asked the Senate and House Appropriations committees for another $97.4 million this fiscal year, which ends Sept. 30, and $310.9 million in fiscal 1983 "to hold to existing (nuclear warhead) production schedules," a White House fact sheet stated.

Last week, the administration disclosed that it wants another $1 billion for bomb production between 1984 and 1987, in addition to substantial increases previously proposed for that period.

The current 1982 budget provides $4.67 billion for the nuclear weapons program, up from $3.65 billion in 1981. Before his latest request, Reagan was seeking $5.5 billion for 1983.

A Senate source confirmed as "in the ballpark," independent calculations that estimate the government intends to add 17,000 nuclear warheads to its existing stockpile of 25,000 weapons over the next 15 years. A House source said the "vast majority" of new weapons would serve as replacements for existing armaments, many of which are nearly 25 years old.

Reagan is likely to encounter some trouble in the Senate, where Appropriations Committee Chairman Mark Hatfield (R — Ore.) and Sen. Edward Kennedy (D — Mass.) are co-sponsoring a resolution calling for an immediate worldwide freeze on weapons production.

Meanwhile, the U.S. Nuclear Regulatory Commission confirmed Tuesday it has approved a new route through New York state for the trucking of nuclear waste from Ontario to South Carolina.

But whether the Nuclear Assurance Corp. of Atlanta, Ga., which transports the waste, will actually be allowed to use the route will depend on a suit currently before U.S. courts.

Nuclear Assurance has sought permission to transport spent nuclear rods from the Chalk River experimental reactor in Ontario across New York state highways into Pennsylvania and points south.

The route approved earlier this month by the NRC allows the nuclear waste to be moved on interstate highways, including the New York state thruway which currently bans high-grade nuclear shipments.

Senator seeks probe of uranium dealing

WASHINGTON (Reuter) — Senator John Glenn says two American brokers may have undercut Washington's nuclear non-proliferation policy by arranging the sale of about 100 tonnes of European enriched uranium to South Africa.

The Ohio Democrat has asked federal agencies whether the sale violated U.S. law, but the brokers and at least one of the federal agencies say it did not.

Executives of Edlow International and SWUCO, Inc., both in the Washington, D.C., area, say they arranged sale of the uranium from Swiss and Belgian interests to South Africa for its new Koeberg nuclear power plant near Cape Town.

"We've been doing this (brokering nuclear fuel) for years," Jack Edlow, president of Edlow International, told Reuters. "There's nothing new about it."

"What we arranged for is perfectly legal," said John LaFond, vice-president of SWUCO. "Let me assure you, we checked it every way."

Sales of U.S. uranium to South Africa are illegal under the U.S. Nuclear Non-Proliferation Act because South Africa has not signed the Nuclear Non-Proliferation Treaty.

But Edlow said the two firms brokered the sale of European uranium, not American fuel, by buying it from the Swiss and Belgian interests and selling title to South Africa.

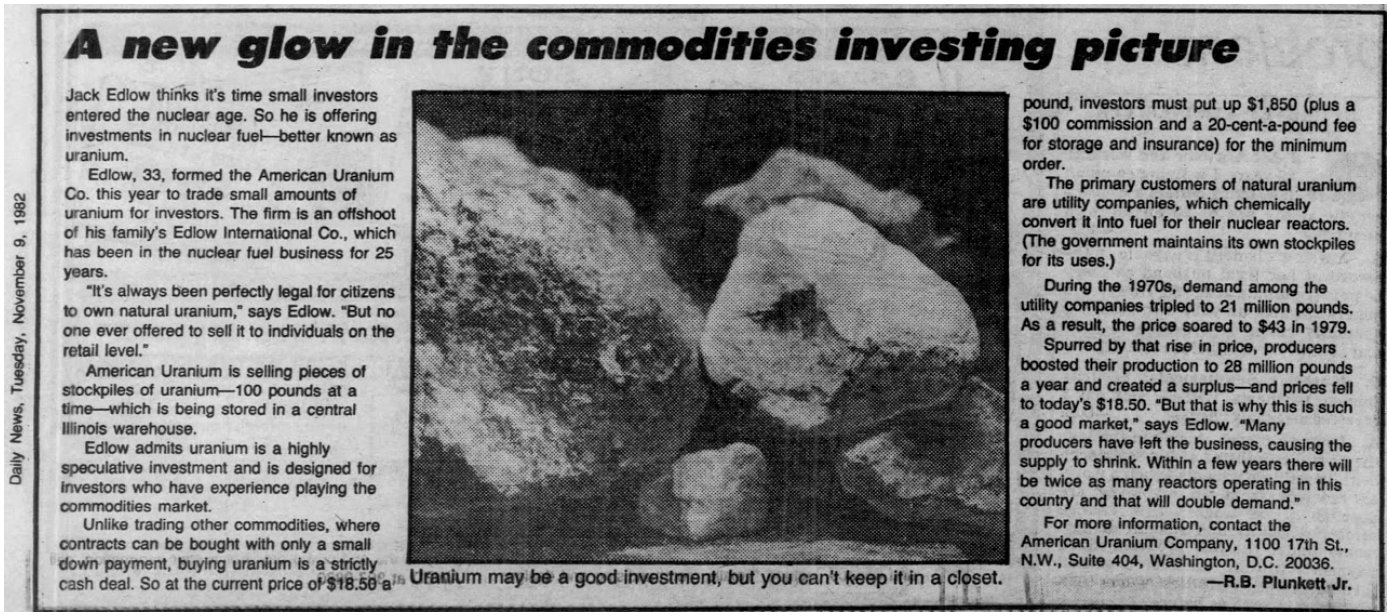
An aide to Glenn said the question is whether it became American uranium when the American brokers bought it for the resale.

The fuel is for South Africa's first nuclear fuel plant.

1982-04-14-the-star-phoenix-sasktatoon-pg-c-2-clip-nuclear-spending-transport / https://drive.google.com/open?id=1hfiiz5R5-vhSxMCTtBuk4eDZcofO-quj

Nov 9 1982 - Jack Edlow - American Uranium Company offshoot

1982-11-09-the-daily-news-new-york-pg-32 / https://drive.google.com/open?id=1bZ4poBW_xaqPpuKjWYuJe0SYHDhB2qlH



Daily News, Tuesday, November 9, 1982

A new glow in the commodities investing picture

Jack Edlow thinks it's time small investors entered the nuclear age. So he is offering investments in nuclear fuel—better known as uranium.

Edlow, 33, formed the American Uranium Co. this year to trade small amounts of uranium for investors. The firm is an offshoot of his family's Edlow International Co., which has been in the nuclear fuel business for 25 years.

"It's always been perfectly legal for citizens to own natural uranium," says Edlow. "But no one ever offered to sell it to individuals on the retail level."

American Uranium is selling pieces of stockpiles of uranium—100 pounds at a time—which is being stored in a central Illinois warehouse.

Edlow admits uranium is a highly speculative investment and is designed for investors who have experience playing the commodities market.

Unlike trading other commodities, where contracts can be bought with only a small down payment, buying uranium is a strictly cash deal. So at the current price of $18.50 a pound, investors must put up $1,850 (plus a $100 commission and a 20-cent-a-pound fee for storage and insurance) for the minimum order.

Uranium may be a good investment, but you can't keep it in a closet.

The primary customers of natural uranium are utility companies, which chemically convert it into fuel for their nuclear reactors. (The government maintains its own stockpiles for its uses.)

During the 1970s, demand among the utility companies tripled to 21 million pounds. As a result, the price soared to $43 in 1979.

Spurred by that rise in price, producers boosted their production to 28 million pounds a year and created a surplus—and prices fell to today's $18.50. "But that is why this is such a good market," says Edlow. "Many producers have left the business, causing the supply to shrink. Within a few years there will be twice as many reactors operating in this country and that will double demand."

For more information, contact the American Uranium Company, 1100 17th St., N.W., Suite 404, Washington, D.C. 20036.

Now investors can buy uranium on market

By MICHELLE BOLAR
Journal of Commerce

WASHINGTON — Commodity investors who are tired of the same old soybeans now have an explosive new market they can tackle — uranium.

Trading in the uranium cash market began Oct. 18 in the Washington offices of American Uranium Co. Thus far, total volume in the new market has reached more than 4,000 pounds.

As with any other commodity, uranium investors must open an account and deposit funds prior to purchase. American Uranium's transfer agent is the National Bank of Washington, and the new cash market will be policed by the accounting firm of Coopers & Lybrand.

American Uranium, a subsidiary of a nuclear fuels transporting company, Edlow International, was founded specifically to open spot trading in uranium to the public. Although not widely known, anyone can own yellowcake, the term for the mustard-colored uranium powder.

Uranium, however, cannot be "shipped off to thousands of locations for people to keep in their garage," said Jack Edlow, 33, president of American Uranium.

ALTHOUGH YELLOWCAKE is not flammable, explosive or combustible, by law, it must be stored in U.S. government-licensed warehouses.

Therefore, the closest uranium investors can get to their slightly radioactive metal is an American Uranium Co. certificate. Each certificate represents "an undivided but specific" amount of uranium that is stored for the buyer in a federally licensed facility in St. Louis owned by American Uranium.

Acting as a broker, American Uranium buys and sells yellowcake on orders from its customers. (The company also buys and sells uranium as a principal for its own account.)

Investors receive a price quote from American Uranium over the telephone for uranium to be bought or sold. In addition, the company provides investors with information concerning the full cost of the transaction, including commissions and any storage charges.

The minimum-size certificate is 100 pounds, with larger certificates sold in 50-pound increments.

"We started out thinking of trading in drums of uranium. But financial analysts recommended dropping the level to 100 pounds so that small investors could take advantage of the market," Edlow explained.

HOWEVER, SMALL investors will not be the only ones benefiting from the new market. Yellowcake purchases from American Uranium of up to $4,000 carry a $100 commission, while purchases ranging from $4,000 to $10,000 carry the same commission along with a 2.5 percent fee on amounts in excess of $4,000.

Transactions ranging from $10,000 to $50,000 carry a $250 purchase commission. In addition, a 2 percent fee is added to amounts exceeding $10,000.

Purchases of more than $50,000 are charged a $1,050 commission, with a 1.5 percent fee for any amount greater than $50,000.

Yet despite the towering figures, American Uranium's president noted that at current prices ($18 to $20 a pound), the minimum capital a small investor in the uranium market would need — including commissions, insurance and storage — is $1,950.

"THERE HAS BEEN no institutional trading so far," said Edlow. "Only individuals in the uranium business who cleared the matter with their companies, to make certain there was no conflict, and then purchased the uranium business who cleared the matter with their companies, to make certain there was no conflict, and then purchased the uranium for their own interest."

Uranium primarily is used to produce fuel for nuclear-powered electric generating plants. Before the opening of the new market, uranium was bought generally only by utility companies, nuclear fuel companies, research organizations and governments. There was no facility for small purchases of yellowcake.

The only way investors could participate in the uranium market was either by buying stocks of uranium companies — such as the New York Stock Exchange-listed UNC Resources and Atlas Corp. — or by actually purchasing mineral rights to uranium deposits, a source at American Uranium observed.

EDLOW IS eager to see a boom in the nuclear fuels industry. He expressed confidence in the future of nuclear fuels, citing statistics that showed a jump in domestic uranium usage from 7 million pounds in 1970 to 21 million pounds in 1980. He projected demand for uranium would climb to 31 million pounds by 1985 and 37 million pounds by 1990.

Despite the optimistic demand figures, the spot price of uranium has dropped from a high of $40 per pound in 1980 to its current range of $18 to $20 per pound. Inventory liquidation by consumers is largely responsible for the price decline.

URANIUM TO SOUTH AFRICA: The State Department has quietly circumvented longstanding U.S. foreign policy by allowing an American company to act as middleman in a deal that has sent enriched uranium to South Africa.

The Nuclear Non-Proliferation Act bars the export of nuclear material to any nation that refuses to allow international inspection of its nuclear facilities. South Africa, which does not allow such inspection, is believed to be dangerously close to production of nuclear weapons — if it has not already succeeded.

Yet Edlow International, a Washington-based brokerage firm, arranged two shipments of enriched uranium — the raw material of nuclear bombs — from the United States to South Africa through European nations. And Edlow did it with the full knowledge of the State Department.

Harry Marshall, senior deputy assistant secretary o
state, admitted to Rep. Howard Wolpe, D-Mich., that h
had met with Edlow officials while the deal was beinj
made. He told Wolpe that he had neither encouraged no
discouraged Edlow's uranium transaction.

Marshall told Wolpe, who is chairman of the Hous
Foreign Affairs Subcommittee on Africa, that ther
really was little the State Department could have don
to discourage Edlow's defiance of the non-proliferatio
law. Yet the Reagan administration didn't hesitate t
lean on private American companies that wanted to sel
the Soviets machinery for the natural-gas pipeline t
Western Europe.

South Africa's nuclear plans cause concern

JEFF NESMITH
Cox News Service

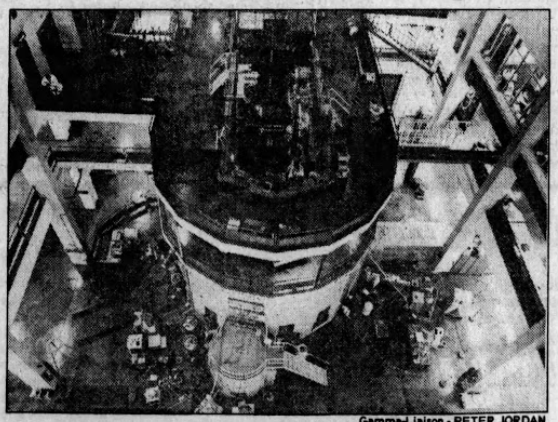
WASHINGTON — Bargain-hunting by U.S. electric companies and a Reagan administration policy called "constructive engagement" are being blamed for allowing South Africa to frustrate international efforts to block the spread of nuclear weapons.

Several companies recently bought about 80 tons of low enriched uranium owned by South Africa and stored at U.S. Energy Department warehouses in Piketon, Ohio. When the fuel is converted to electricity for Americans, South Africa will have completed a complex maneuver that skirted efforts to get it to forego development of nuclear weapons.

A United Nations report last year warned that South Africa may already have used its small, tightly-guarded uranium enrichment plant to refine enough uranium for 15 atomic bombs — with more on the way.

But a State Department official has told the House subcommittee on African affairs, "We feel that we can achieve our (non-proliferation) objectives better with South Africa by not engaging in unnecessary activities which would produce a deteriorating relationship."

"It's not that they (Reagan officials) have set the train in a totally different direction" from former President Carter, says Joseph Nye, a former State Department official involved in developing Carter nuclear proliferation policy. "But the engine has run out of steam and is subject to frequent derailments."



Gamma-Liaison - PETER JORDAN

Research reactor at Valindaba, Swahili for 'we'll never tell'

The State Department says the new administration takes a carrot-and-stick approach called "constructive engagement."

Concern focuses on a small uranium enrichment plant at Valindaba, a town near South Africa's capital, Pretoria. The facility can take raw uranium and, if international suspicions are correct, soup it up for use as the explosive in nuclear bombs.

South Africa refuses to permit inspectors from the International Atomic Energy Agency inside the plant. The government has also refused to sign the Non-Proliferation Treaty as a security measure.

"It must be realized that South Africa is threatened by the USSR and its associates and by certain African countries with Soviet support and encouragement," states a secret South African document leaked last year.

In 1975, President Ford suspended U.S. shipments of highly enriched uranium to a research reactor because South Africa wouldn't sign.

At that time, the United States also had a contract to enrich South Africa uranium for use in power reactors under construction at Koeberg, near Cape Town. South Africa was to ship its own raw uranium — or "yellow cake" — to the United States.

Following enrichment at Oak Ridge Laboratories, the uranium was to be shipped to France, where South Africa had a contract for it to be fabricated into nuclear reactor fuel rods.

In 1977, Carter refused to authorize export of the low-enriched fuel. In addition, the United States obtained a commitment from France that no fuel would be fabricated until South Africa agreed to the treaty and nuclear safeguards.

In 1979 Congress enacted the Nuclear Non-Proliferation Act, which prohibited export of nuclear materials and equipment to countries that had not signed the Non-Proliferation Treaty.

Yet, South Africa continued to ship raw uranium to the Department of Energy to be enriched into fuel. As the uranium was enriched, the Energy Department billed South Africa. South Africa paid. The enriched uranium accumulated at Piketon.

During the 1980 presidential campaign, candidate Ronald Reagan said nuclear proliferation was "none of our business."

In May 1981, South African Foreign Minister Pik Botha came here and met Alexander Haig, then secretary of state. Prior to that, the South African Embassy here prepared a four-page argument that the United States should relax the nuclear pressure.

This document, marked "secret," leaked. The embassy asked that the United States either release its enriched fuel for export or stop pressuring the French to not supply fuel. A few weeks later, representatives of the Washington uranium broker, Edlow International Inc., visited the State Department to outline a proposal for South Africa to buy fuel from France. Surplus reactor fuel was available in France, the Edlow representative said, because power companies in Switzerland had bought it but found they did not need it.

After South Africa had bought fuel from the French, the only matter unresolved was the fuel it owned, but still could not ship, in Piketon.

Officials of Oak Ridge Laboratories, which operate the Piketon facility, a few days ago released figures indicating South Africa had paid to have about 150 tons of uranium enriched. The Energy Department fee for this service was about $62 million.

Energy Department officials said SWUCO Inc., a Maryland fuel broker, took 80 tons of the fuel last year and has sold all of it to U.S. utilities. The Energy officials refused to identify the utilities.

"In this affair, the United States participated in something that is very dangerous to the continent of Africa and to the whole world, because it will help South Africa develop nuclear weapons," said Ken Zinn, associate director of the Washington Office on Africa, an organization that develops information on apartheid and South African nuclear developments.

The nuclear reactor at Three Mile Island . . . plagued by misadventure.

PAUL SHEEHAN, in New York, on the great decline of nuclear energy

US goes cold on yellowcake

AUSTRALIAN yellowcake is not exactly a hot item in America these days, if you'll forgive the pun.

There is a huge oversupply on the world's raw uranium market. Even if there were not, the condition of the United States nuclear energy program is in not even remotely conducive to significant growth.

All nuclear plants ordered in the US since 1974 have been cancelled. None has been ordered since 1978, the year before the near-meltdown at Three Mile Island.

Numerous nuclear reactors have suffered horrendous cost-overruns and been plagued by delays, mismanagement and misadventure. The industry is only 20 years old, but already 10 plants have been permanently closed and 97 orders have been cancelled (almost equal to the numbers of reactors now in operation).

A crucial battle — which may represent the high-water mark of the American nuclear energy program — is being waged in Congress over the largest and most expensive nuclear reactor ever proposed for the United States, the Clinch River plant in Oak Ridge, Tennessee.

Last year Congress almost withdrew all funds for this breeder reactor because it is suffering enormous cost-overruns. This year, with a more liberal Congress elected last November, Clinch River may go under

The Atomic Energy Commission initially estimated that Clinch River would cost $A575 million. The Department of Energy now estimates it would cost $4.1 billion. But the General Accounting Office says this estimate does not even include the cost of plutonium and running the plant. It says Clinch River would cost $9.8 billion — 17 times higher than the original estimate.

President Reagan's Budget director, David Stockman, has long been vehemently opposed to the huge and growing Federal subsidies for Clinch River and has described the project as "totally incompatible with our free-market approach to energy policy."

URANIUM
The boom that never was

With recession, energy conservation, lower oil and coal prices, hostile public opinion, plus the cost and safety problems, estimates of America's nuclear energy needs have dropped spectacularly.

In 1971 the Atomic Energy Commission forecast that by 1980 the capacity of American nuclear power stations would be 150 billion watts. The AEC later revised this estimate down to 132 billion watts. The actual capacity turned out to be only 53 billion watts.

The AEC also forecast in 1971 that capacity in 1985 would be 300 billion watts. Ten years later, this estimate was trimmed to 280 billion, but it now appears that America's capacity in 1985 will be at most 90 billion watts.

And now the grandiose estimates of US capacity at the turn of the century are now looking like flights of fantasy. In 1971 the AEC estimated that by the year 2000 America would be able to generate 1,200 billion watts, making it the most important energy source in the country. The estimate is now 165 billion watts and even that is optimistic.

The effect of all these problems, and all these scaled-down expectations, is that prospects for Australian uranium exports to the US — providing they are allowed by the Labor Government — are bleak.

Professor Manson Benedict, emeritus professor of nuclear engineering at the Massachusetts Institute of Technology, points out that America's stockpile of reusable uranium is 250,000 to 300,000 tonnes. If all this stockpile were placed in breeders and converted to plutonium, it would yield more than 200,000 tonnes, enough fuel to generate about 700 times the electricity made in the US last year.

(However, he says more giant breeder reactors — such as the infamous Clinch River — are essential to America's ability to recycle this fuel.)

Because its future is so bleak, one of America's biggest uranium producers, UNC Resources, has announced that it is getting out of the business.

Most US uranium mines are closed because the raw uranium is selling for barely half what it costs to get out of the ground. It is the same cost squeeze that prompted Exxon (through its subsidiary Esso) to back out of the proposed $438 million Yeelirrie project in Western Australia.

In addition to this oversupply and the many problems with nuclear plants, there is the burgeoning nuclear freeze movement, which is also finding expression as a general anti-nuclear movement. Nuclear politics have finally started to glow in America.

Because of this growing hostility, the White House has ordered the termination, or at least the indefinite postponement, of an $8 billion uranium enrichment plant in Portsmouth, Ohio, because of "current Congressional funding problems."

The outlook for foreign uranium suppliers is bleak and a 1981 report by the Department of Energy says: "It is likely that over the next few years most domestic utilities will continue to buy US-origin uranium and that the actual percentages of foreign uranium utilised will be well below the allowable quantities."

The Department of Energy report also estimates that Australia's share of total uranium imports to the US is expected to continue to shrink, largely replaced by yellowcake from Canada and South Africa. The report noted that "the Australian Labor Party . . . have indicated they may disavow uranium sales contracts if they are voted into power. . . This has clouded the Australian position as a supplier"

Across this unremittingly dull export vista, there are a few outcrops of good news for those who wish to see Australia increase its revenue from uranium exports. In December, the House of Representatives rejected legislation to restrict foreign uranium exports to the US.

The way now appears clear for the US to phase out the last of its import restrictions on uranium and, under a plan that has been implemented since 1974, the last restrictions are to be phased out next year.

There are also market analysts who believe that American power companies are in the process of running down their inventories of yellowcake and the moribund market could be set to stir to life again.

Jack Edlow, who runs a nuclear fuel supply business, Edlow International, believes the US has already run down its excess inventory.

"In the next 10 years demand for uranium will double," he says. "This year US consumption should exceed production by several million pounds, and beyond the US there is a major world demand for uranium."

He predicts that US domestic uranium usage will increase from 10,000 tonnes in 1980 to 15,000 tonnes in 1985 and 18,000 tonnes in 1990.

With the price of yellowcake now at an all-time low, Mr Edlow says there is only one way for it to go — up. Prices collapsed, he said, because of high interest rates.

"Uranium producers have been unloading their uranium to raise cash and to save the cost of borrowing to pay for carrying uranium inventory.

"That has largely ended. With interest rates coming down, the pressure is no longer on the market. We can see now there is significant, long-term demand for uranium."

But I didn't find anyone in the US willing to express confidence that Australian yellowcake will be a hot item here again.

TOMORROW: Well, there's Europe

1983-04-28-the-sydney-morning-herald-pg-7-clip-us-cold-on-yellowcake / https://drive.google.com/open?id=1hlL4vUSb-urY1QbNblrPSBf2bMG9Lsmu

'Yellow Cake' Fire Under Investigation

By Lisha Gayle
and Robert Kelly
Of the Post-Dispatch Staff

Authorities are trying to find the cause of a fire in East St. Louis Wednesday that damaged part of a warehouse containing 39 steel drums of uranium material.

They also want to know why the building's fire and sprinker systems apparently failed to work properly during the blaze.

Government officials said the fire posed no radioactive danger to the area.

The fire broke out Wednesday about 12:30 a.m. in the warehouse, at 3131 St. Clair Avenue, and was under control in about an hour. It was reported to firemen by a passer-by after the building's fire alarm failed to sound, said East St. Louis Deputy Fire Chief Leverse Brooks.

The 55-gallon drums in the part of the warehouse that burned contained "yellow cake," a uranium oxide used to make fuel for nuclear power plants, said David Ed of the Illinois Department of Nuclear Safety. Yellow cake gives off a low level of radiation, he said.

Part of the roof of the warehouse collapsed onto the drums, but none of them leaked, authorities said.

A physicist from Ed's office in Springfield, Ill., Wednesday examined the site with a radiation-detecting device and found the drums intact, Ed said.

But at least one of the drums appeared to have been badly dented. An automobile parked in the warehouse also was destroyed in the blaze. Brooks said the car belonged to a security officer.

Jan Strasma, a spokesman for the Chicago office of the Nuclear Regulatory Commission, said the warehouse had been licensed for the last four years to store three radioactive materials — yellow cake, uranium hexaflouride and slightly enriched uranium. The license and lease on the building are held by Edlow International Co. of Washington.

Strasma said that security measures at the warehouse would be reviewed in light of the fire and that a determination would be made on whether improvements are needed before the license is renewed.

Brooks said fire officials were puzzled because the warehouse's sensitive alarm system had failed to sound, so firefighters could not tell how long the fire had been burning when they arrived at the scene. The sprinker system in that part of the building also apparently had operated improperly, he said.

No security guard was on duty at the time of the fire, but Strasma said that was not an NRC requirement if adequate alarm systems were installed. He said the NRC would conduct its own investigation of alarm and sprinkler systems.

"The first goal of our inspectors was to determine that there was no radiation problem at the warehouse, and they found none," Strasma said. Two NRC inspectors investigated the fire Wednesday, he said.

The fire was confined to the eastern part of the one-story, brick warehouse, which is divided into three sections by brick fire walls. The middle third of the building was nearly empty, Ed said. The western third of the building contained about 18 canisters of uranium hexaflouride, another material used to make fuel for nuclear-power plants.

Uranium hexaflouride is inflammable, Ed said, but it is stored in fire-resistant metal containers. Had that material burned, it could have produced poisonous flouride gas and a residue with a low level of radioactivity, Ed said.

Bruce W. Podhurst, vice president of Edlow International, said about two truckloads of radioactive material were shipped to the warehouse each month. He said the material in the drums in the burned-out area was worth about $300,000.

Those drums will be moved to the part of the warehouse that is still intact, he said.

The warehouse is the only licensed uranium-storage facility in the eight-state Midwestern region of the NRC, Strasma said.

The uranium hexaflouride is contained in large cylinders with inch-thick steel walls, said Jack Edlow, president of Edlow International.

Podhurst said the yellow cake stored at the warehouse was to be used by unspecified utilities and was to be shipped to processing plants in Oklahoma, Illinois and Ohio. Union Electric Co. and Illinois Power Co. are not among the utilities using the warehouse, he said.

Sister Cecilia Hellmann, co-principal at nearby St. Patrick Catholic School, said she had considered closing school Wednesday after the fire. The school remained open after she was assured by NRC officials that there was no danger. The school is at 33rd Street and Summit Avenue, only a few blocks from the warehouse.

The fire broke out only a few weeks after Sister Hellmann discussed her concerns with a city official and a physicist from Washington University. After that meeting, Michael Preston, capital improvement commissioner for East St. Louis, wrote to the Nuclear Regulatory Commission for information on plans for an emergency at the warehouse. Sister Hellmann said the NRC had not yet answered the letter.

"I don't believe these kinds of sites should be so near a populated area because of the risk of toxic fumes," Sister Hellmann said.

Licensed storage facilities are periodically inspected, but Strasma did not know when the East St. Louis warehouse was last inspected.

Although there is disagreement over how toxic yellow cake is, some experts warn that a single particle of the substance could cause lung cancer if it is inhaled and becomes lodged in a person's lung.

(Jon Sawyer of the Post-Dispatch Washington Bureau provided some information for this story.)

Questions After A Fire

1983-12-14-st-louis-post-dispatch-pg-18a

Federal officials say that last week's fire at an East St. Louis warehouse posed no radioactive danger to the area. That is reassuring as far as it goes. But there remain several troubling questions about the incident that still need to be explained.

Among them are these: Why did the building's alarm system fail to sound? Why did its sprinkler system fail to work properly? And why was the material stored in East St. Louis in the first place, since it was miles from where it would normally be processed?

The Chicago office of the Nuclear Regulatory Commission says it will be investigating the failures in the building's security systems before it decides whether to renew a license for the firm in charge of the warehouse, Edlow International Co. of Washington. But it ought to do more than that.

In the course of the fire, the warehouse roof collapsed, damaging some barrels of radioactive material. Though federal authorities say no dangerous radioactivity escaped, what if it had? East St. Louis officials ought to make a point of finding out more about the risks they have accepted by allowing such materials to be stored in their city. And, given the circumstances that contributed to last week's near miss, the NRC ought to be asking itself whether Edlow's storage license in East St. Louis should be renewed at all.

1983-12-14-st-louis-post-dispatch-pg-18a-clip-fire-warehouse-edlow / https://drive.google.com/open?id=1ftRrzQmyw_aYWTCsYR6mKSAIOPNMsM7R

Drive Mounts To Bar Uranium Storage At East St. Louis Warehouse

1984-01-03-st-louis-post-dispatch-pg-4a

By Marjorie Mandel
Of the Post-Dispatch Staff

The principal of an elementary school, several anti-nuclear activists and some civil rights leaders have joined forces in an attempt to shut down a uranium storage warehouse in East St. Louis.

The unusual alliance was formed after a fire Dec. 7 that damaged the Edlow International Co. warehouse at 3131 St. Clair Avenue. Part of the roof collapsed onto drums of "yellow cake," or uranium ore used to make fuel for nuclear power plants.

Although government officials say no radioactivity was released, some residents and anti-nuclear activists say they are not reassured. They contend that the tons of radioactive materials stored in the warehouse pose a continuing threat to East St. Louis.

"I'm incensed, apprehensive and nervous," said the Rev. Buck Jones, director of Project HOPE, a civil rights group based in East St. Louis. "We're going to educate and mobilize our people. We're not going to stop until it's removed."

Johnny Scott, president of the East St. Louis branch of the National Association for the Advancement of Colored People, said: "I am appalled that our citizenry is exposed to this kind of potential danger. There's no question about it — we want it moved."

Jack Edlow, president of Edlow International, denied that the radioactive materials posed a danger to the city.

"They do not present a major risk," he said in a telephone interview from Washington. "Just because something is radioactive doesn't mean it's a super hazard."

The warehouse is licensed by the Nuclear Regulatory Commission. Nathan Bassin, a commission official, noted that the warehouse only stored radioactive materials and did not process them.

"We looked very carefully at what they were going to do and how they were going to do it," he said. "We felt there was very little potential for any kind of big problem."

Most of the opponents say that before the fire, they were unaware of the contents of the warehouse. But Kay Drey, an anti-nuclear activist from University City, says she has been concerned about the warehouse since shortly after it opened in 1980.

"This material never should have been allowed to be stored close to where people are living," she said.

Michael Preston, capital improvements commissioner of East St. Louis, wrote to an NRC official in November — a month before the fire — to express concern about operations at the warehouse.

The fire galvanized opposition to the warehouse. The sprinkler system failed to work, and firefighters were alerted by a passer-by after the alarm system malfunctioned.

Government officials say it is difficult to speculate on what might have happened if the drums of yellow cake had ruptured or if the fire had broken out in the part of the warehouse that stored more radioactive material.

Mrs. Drey said: "I think we were really lucky with the fire. I think it could have been a disaster."

East St. Louis Deputy Fire Chief Leverse Brooks said the cause of the fire had not been determined. He said Edlow had been ordered to repair the sprinker system, to install a fire hydrant on the property and to do other work.

The NRC also sent a letter to Edlow requiring certain work, including repairs to the sprinkler system, improvements in security and development of a written emergency agreement with police and fire officials.

Russ Marabito, an NRC spokesman, said Friday that the company had not responded. Edlow, the company president, said the work was nearly completed.

Until the NRC gives its approval, no more radioactive material may be taken to the site, Marabito said. Thirty-nine 55-gallon drums of yellow cake involved in the fire must be repacked before they can be shipped out, he said.

Edlow International has been in the nuclear business since 1957, primarily in transportation of nuclear materials. NRC officials say the company has a good business and safety record.

Bassin, the NRC official, said Edlow was one of the major uranium brokers in the country. He said the company arranged for shipments of uranium ore from mines in Western states to plants where it is enriched, converted into nuclear fuel and shipped to power plants. Some of Edlow's biggest customers are nuclear power plants overseas.

Lazy And Blind

1984-01-09-st-louis-post-dispatch-pg-12a

Last month, fire destroyed one-third of an East Side warehouse used to store radioactive materials. The fire had to be reported by passersby, because the building's automatic alarms failed, as did its sprinkler system. East St. Louis firemen fought the blaze without a predetermined plan for dealing with the special hazards at the facility.

Federal officials insist that the fire posed no radioactive danger, but the incident has galvanized several leaders of the nearby community to launch a drive to have the storage facility shut down. Their concerns ought to be heightened by the Nuclear Regulatory Commission's response, which has proven the agency to be a very casual watchdog. Essentially, the NRC is leaving it up to Edlow International, the Washington, D.C.-based firm that operates the warehouse, to analyze what went wrong and to certify that everything is just fine once again. In addition it has belatedly asked the firm to develop written agreements with local police and fire officials for dealing with emergencies in the future.

But not only is the agency lazy, it is blind as well. One of its Washington spokesmen insists that the warehouse is "not in a residential area per se" when in fact it is within a few hundred feet of a residential neighborhood and directly on a route children take to a nearby grade school.

The first question raised by the fire should have been asked before it was first licensed by the NRC: Why is such a potentially dangerous facility allowed at that location? The second is the one East St. Louis residents are now asking: Why should the operation be allowed to continue?

Perhaps an inquiry from Sens. Percy and Dixon would wake up the sleepy federal watchdogs and maybe even reverse the casual approach the agency has taken to an incident that could have led to tragedy.

Evidence Of Reagan Support To South Africa

Michigan Congressman John Conyers has released the following information as further evidence that the Reagan Administration has permitted the export of military and police equipment and technology to South Africa.

1. Despite a 1977 United Nations Arms Embargo to which the United States is a signatory, the State Department has lifted export restrictions on military and militarily potential equipment on the State Department's Munitions List. According to official figures between 1981 and 1983, the Administration allowed the export of $28.3 million in Munitions List equipment to South Africa in 29 separate license approvals.

Preliminary figures document that in the first quarter of 1984, the amount of Munitions List equipment licensed for export to South Africa exceeded $88 million. This equipment includes military and space electronics, optional and guidance equipment, turbo jet aircraft, and technology useful in the manufacture of arms. By contrast, the Carter Administration licensed $25,000 in Munitions List equipment in 1979; there were no licenses in 1980.

2. South African government installations that have been the recipients of State Department Munitions List equipment include the National Physical Research Laboratory and the National Institue for Aeronautics and Systems Technology, both of which do classified military research for the South African government.

3. The Commerce Department has permitted the sale of computers to agencies of the South African government that enforce apartheid such as the Ministry of Cooperation and Development, the Ministry of Interior, the Ministry of Manpower and the Ministry of Justice. IBM computers are used by the South African government to maintain race classifications in enforcing the pass system.

4. Changes in the Commerce Department export regulations permitted the sale of U.S. manufactured Beech and Piper aircraft, reclassified as "medical supplies," to the South African Air Force in 1982. The planes are frequently used for reconnaissance and intelligence-gathering purposes, and could well be used in the Namibian war.

5. In November 1983, a highly advanced U.S. manufactured computer system (VAX 11/782, made by Digital Equipment Corp.) was seized in Sweden en route to the Soviet Union. The attempted diversion to Moscow was regarded by the Administration as a serious security breach as the computer was capable of a variety of military functions, including operating a missile guidance system.

Before this computer was rerouted to the Soviet Union via Sweden,the sophisticated hardware had been shipped with U.S. government approval to a private South African firm.

6. The Reagan Administration has expanded nuclear cooperation with South Africa despite South Africa's unwillingness to adhere to the Non-Proliferation Treaty to accept the International Atomic Energy Agency (IAEA) safeguards. Specifically, in March of 1982, the Administration granted an export license to Control Data Corp. to sell South Africa's Center of Industrial and Scientific Research, a leading defense research group, a Cyber 175/750 computer.

This advanced computer can be used to simulate nuclear explosions and its sale was not approved by the previous Administration for precisely that reason.

Cont'd on page 4, see Reagan Support

Cont'd from page 1

Reagan Support

7. In addition, two U.S. companies- Edlow International and SWOCO-acted as brokers in the sale of enriched uranium fuel for South African reactors without any protest, anticipatory action, or remedial action by the Administration. Furthermore, nuclear technicians have traveled to South Africa and South African nuclear technicians have been trained here at U.S. facilities according to the House Subcommittee on Africa.

8. In 1982, the Department of Energy permitted South Africa to export uranium feedstock to the United States for enrichment at three separate U.S. plants. At the present moment, a decision is still pending at DOE on the re-export of this enriched uranium to South Africa.

9. In 1982, the Commerce Department approved the export of 2,500 electric shock batons to the South African police. Chester Crocker, Assistant Secretary of State for African Affairs, has termed the matter "a mistake."

10. Italo-West German police surveillance aircraft were exported to the South African Military force in Bophuthatswana. The Commerce and State Departments failed to monitor the end-use of the engines that were used for these aircraft which were manufactured in the United States by Avco-Lycoming. It is the responsiblity of the State Department and Commerce Department to monitor end-use of all military related exports.

11. In a similar case, the South African (Ciskei) defense Force recently received two Skyvan STOL (short take-off and landing) air transports from a civilian source in South Africa in 1982. The engines for these planes were manufactured by Garrett-AIRsearch of Los Angeles.

12. U.S. manufactured Colt and Browning weapons are in use at a commercial "anti-terrorist" training center in South Africa. Other U.S. made police equipment, openly advertised in South African security journals, include electronic senors, infrared detectors and tracking equipment. Among the U.S. security companies represented in South Africa are Technipol International, Racon and Raytek.

13. Investigation hearings conducted by the House Subcommittee on Africa in 1982 documented UN arms embargo violations in which officials of the Defense Department and Central Intelligence Agency were implicated.

14. Expanded diplomatic contact with the South African military and police include the trianing of the South African Coast Guard in 1981. The Administration has permitted the South African government to establish as many as five new honorary consultates in Seattle, Denver, Cleveland, Pittsburgh and Phoenix. Since 1981, official intelligence contacts have resumed between both countries as have official nuclear advisory contacts.

15. Economic support for the South African government has included the Administration's unconditional support for a $1.1 billion International Monetary Fund (IMF) loan in 1982. That same year, South Africa's military expenditures increased approximately the same amount.

Diplomatic and political support for the South African government has included the repeated defense of the South African government in the United Nation General Assembly when the Assembly sought to have South Africa expelled, and in the UN Security Council when the Council condemned South Africa for aggression against its neighbors.

These examples are illustrative of a wide range of instances whereby the Reagan Administration has enabled the South African government to fortify the stronghold of apartheid.

This track record must also be viewed against a back rop of increased repression and violence during the past four years by virtually every measure of human rights and democracy. It should be remembered that the UN Arms Embargo to which the United States is in signatory, applies to all of South Africa, not just the South African government.

Demonstrators — many of them school children — leaving the grounds of the Edlow International Co. in East St. Louis Thursday after a rally in protest against the storage of radioactive materials there. The children are from nearby St. Patrick Elementary School.

E. St. Louis Uranium-Storage Protests Studied

By Robert Kelly
Of the Post-Dispatch Staff

The Nuclear Regulatory Commission is studying complaints from East St. Louis residents about a uranium storage warehouse before deciding if licensing requirements for the warehouse should be tightened, a spokesman for the commission says.

Jan Strasma, a spokesman for the commission's regional office in Chicago, said Thursday in a telephone interview that no new material had been moved into the Edlow International Co. warehouse at 3131 St. Clair Avenue in East St. Louis since Dec. 7, when a fire damaged part of the building.

The fire burned through part of the roof, which then collapsed onto drums of "yellow cake" — uranium ore used to make fuel for nuclear power plants.

Security and sprinkler systems at the warehouse have been repaired and upgraded since the fire, Strasma said. But the design of the warehouse is being studied to see if it can be made more secure, he said.

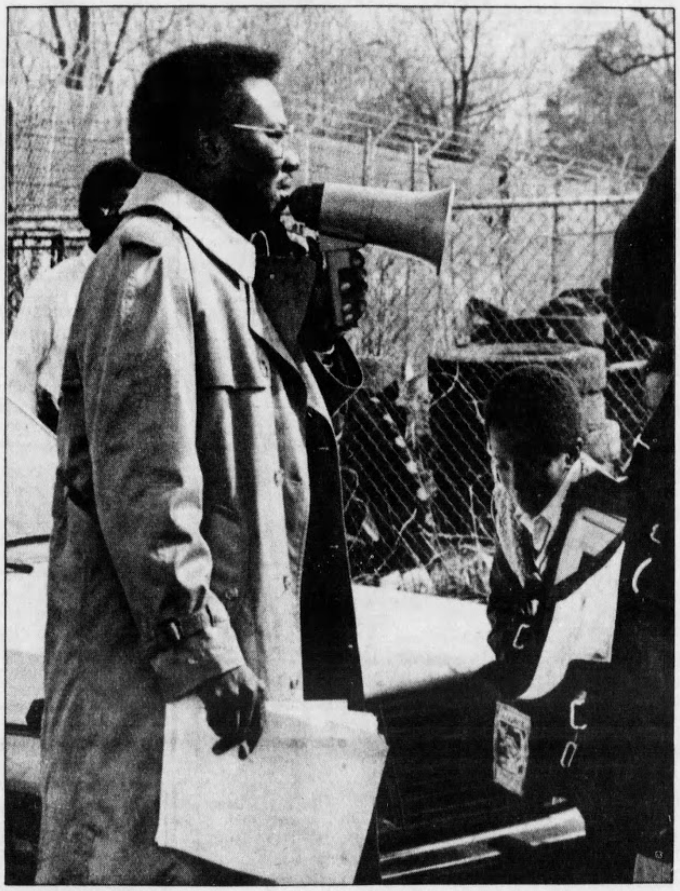
"One of our concerns about the warehouse is that obviously it is not a fireproof structure," he said.

Strasma said that since the fire, he had received some letters and a petition from a coalition of East St. Louis residents urging that the warehouse be shut down. He said they also had urged that the radioactive materials stored there be removed because of the safety hazard to nearby residents.

Strasma said those requests would be considered if the commission were persuaded that the warehouse could not be made safe enough to continue to store radioactive materials within two blocks of homes and schools.

But for now, the warehouse is considered safe for low-level radioactive material, Strasma said. He said the most highly radioactive materials stored there would soon be moved just outside the warehouse in thick steel drums, where fire would be eliminated as a threat. He identified that material as uranium hexaflouride, which is inflammable. But it is stored in fire-resistant metal containers, he said.

Reassurances from the commission and the company have failed to satisfy several residents of the neighborhood near the warehouse.



Renyold Ferguson/Post-Dispatch

The Rev. Buck Jones, director of East St. Louis Project HOPE, speaking to demonstrators at the Edlow International Co. facility.

At a protest rally earlier Thursday at the warehouse gates, the Rev. Buck Jones, director of East St. Louis Project HOPE, told about 250 people, "We are gathered here today in one mind and one spirit. . . . We have a single objective, and that is to shut Edlow down.

"I wonder how Mr. Edlow would feel if this plant was in his neighborhood in suburban Washington," Jones told the rally. He was referring to Jack Edlow, president of Edlow International.

The crowd at the protest rally was swelled by almost 200 students from St. Patrick School, a Catholic elementary school at 735 North 33rd Street.

Sister Cecilia Hellmann, co-principal of the school, said the students had received permission from their parents to attend the rally. The children carried banners with such slogans as, "This boy wants to live," and "Edlow is killing us."

They chanted, "Edlow must go," and, "We love life," and later were joined by members of Prject HOPE, a civil rights group, in singing such civil rights rallying songs as "We Shall Overcome" and "I Ain't Gonna Let Nobody Turn Me Around."

Jones presented a letter at the rally that he had written to Edlow earlier this week. The letter demands that Edlow International leave East St. Louis because of the safety hazard posed by the warehouse.

Jones said he wasn't optimistic because Edlow had told him in a telephone conversation two weeks ago that Edlow International would stay in East St. Louis.

Sister Hellmann also spoke briefly at the rally. She said: "Tomorrow, the world will belong to these young people standing here. They do have a right to a healthy environment, and I believe we are standing before a place that is dangerous to that environment."

In an interview later, Jones said he favored urging area congressmen to take action to close the warehouse. If that fails, residents will continue to march and protest and might even consider "some confrontation," such as trying to crash the warehouse gates, he said. "I think it merits that kind of action, but it's up to the coalition to decide."

Edlow said later in a telephone interview from Washington that any attempt to enter the warehouse grounds would be stopped by security guards now at the site 24 hours a day.

Edlow insisted that the warehouse was safe and that no problems could go unnoticed for long because of the round-the-clock staffing by guards. No guards were on duty when the fire broke out.

At least a few people nearby agreed that the warehouse is safe. Morris Carraway — owner of Morris Tire Service, which shares its parking lot with Edlow's warehouse — said he had no concerns about working next door to the warehouse.

The material in the warehouse has "been checked and checked, and there ain't no danger," Carraway said after the rally.

School Board May Act On Uranium Warehouse

By Robert Kelly
Of the Post-Dispatch Staff

The president of the East St. Louis School Board will ask the board to use its power of eminent domain to take over a uranium storage warehouse in that city and have radioactive material removed.

Clyde C. Jordan, the board president, announced his plans Thursday at a public hearing on the potential dangers of the warehouse. He said the board could could use its power of eminent domain — its right to buy property from an owner unwilling to sell — to claim the warehouse "for educational purposes."

Jordan said his plan was the most expedient way of forcing the Edlow International Co., to shut the warehouse, at 3131 St. Clair Avenue. He and several other speakers at the hearing said the warehouse posed a health and safety hazard.

The Edlow facility is licensed by the Nuclear Regulatory Commission to store low-level radioactive material. A fire at the warehouse Dec. 7 caused part of its roof to collapse, making the building the focus of controversy.

Security and sprinkler systems at the warehouse failed to work during the fire, speakers said at the public hearing. But "blind luck" prevented radioactive mishap, said Wallace Carson, a member of the school board of St. Patrick Catholic School, 735 North 33rd Street. The school is about three blocks from the warehouse.

Carson said he doubted whether residents of the area could convince the Nuclear Regulatory Commission to revoke Edlow's license to operate the warehouse. "The NRC has already issued a license for an unguarded tinderbox in East St. Louis," he said.

Following the fire, guards were stationed at the warehouse around the clock, and security and sprinkler systems were repaired, an NRC spokesman said in a telephone interview. But no new radioactive material has been moved there pending completion of a study on whether more security measures are needed, he said.

The NRC declined to send a spokesman to Thursday's hearing in East St. Louis, although it had been invited to do so by the Rev. Buck Jones, director of East St. Louis Project HOPE.

Jones said he was disappointed by the low turnout at the hearing. But he said the crowd of 70 or so on hand could get Edlow to move out of East St. Louis. "I am convinced that justice, truth and God are on our side," Jones said. "And with those on our side, how can we lose?"

Dan Bolef, a physics professor at Washington University, said the hearing that he disagreed strongly with statements by Edlow International officials that the warehouse is safe.

Bolef said any human error could cause radiation to escape from the uranium stored in steel drums at the warehouse. "Please note that any level of radiation can cause cancer," he said.

Peggy Monroe, who lives on 39th Street, about six blocks from the warehouse, said she had felt a tingling sensation on her skin the morning after the warehouse fire. She said she believed that might have been caused by escaping radiation. "Why are we less (important) than Times Beach people?" she asked. "I'm for doing anything to move that warehouse out right now. How long are we going to let people continue to dump on us?"

Bolef said radiation could cause a tingling sensation such as that experienced by Ms. Monroe. He said the sensation she report also might have been a psychological reaction.

State Sen. Kenneth Hall, D-East St. Louis, and East St. Louis City Clerk Frank Smith said they would do whatever they could to change legislation that allows Edlow to stay in East St. Louis.

"It's sad in this country today that people can move into any area thinking nothing of the health and welfare of the people living nearby," Hall said. "I assure you that all of us working together can do something about this."

Smith is a candidate for the Democratic nomination for state representative from East St. Louis in next month's primary. He said he would take groups of protestors to Springfield, Ill., to lobby in opposition to the warehouse.

He said he also would get in touch with U.S. Sen. Alan J. Dixon, D-Ill., "to let him know that federal laws are exempting local laws (allowing Edlow to stay in East St. Louis), but that there's something he can do about the situation."

Kay Drey, an anti-nuclear activist from University City, said there was no reason for Edlow to store radioactive materials in an urban area. "They could store these materials at the (nuclear) conversion plants" where they are made into fuel for nuclear power plants, she said.

Renyold Ferguson/Post-Dispatch

The Rev. Buck Jones, director of the East St. Louis Project HOPE, speaking at a public hearing on the Edlow International Co. nuclear material warehouse Thursday. The hearing was at the Northwest Center.

Illinois Lawmakers Get Hazardous Waste Bills

By Bill Wilcox

SPRINGFIELD, Ill. — The Illinois Legislature will be asked to consider 17 bills tightening hazardous waste laws and governing long-term waste management.

Attorney General Neil F. Hartigan and Senate President Philip J. Rock announced the legislative proposals Thursday at a news conference here.

Rock said the legislation was the result of recommendations from the Illinois Hazardous Waste Task Force, a group of 110 lawmakers, business leaders and environmentalists appointed to study the state's hazardous waste problem.

"This is a problem that's just not going to go away," Hartigan said.

He said the state had about 800 hazardous waste sites. Many could require major cleanups at a cost of more than $400 million, he said.

Hartigan said the state had only 15 inspectors to identify waste sites. He said that the state was cleaning only two sites a year and that new legislation was needed to speed work at targeted sites.

"There has been inaction on what I think is the worst environmental problem in Illinois history," Hartigan said.

Many of the new proposals focus on streamlining existing operations. "The answer isn't an additional bureaucracy," Hartigan said. "The answer is to make the system that's in place work."

Among the proposals taken from 157 recommendations by the task force is a penny-a-gallon tax on hazardous waste generators.

"This is a tax on generators, not just to raise money, but to discourage waste generation," said Sen. Patrick D. Welch, D-Peru.

Bill Wilcox is a graduate student at Sangamon State University and an intern in the Post-Dispatch Springfield bureau.

Landfill Proposal Prompts Protest

By H.J. Jackson
Of the Post-Dispatch Staff

Jessie Abbott of Centreville says she fears what would happen if a proposed landfill is opened in the 2900 block of Missouri Avenue in East St. Louis.

The site would be a commercial landfill, which Mrs. Abbott contends would be capable of receiving hazardous wastes that could poison the area.

"It's not for East St. Louis trash," she said. "They're commerical. They'll take waste from anywhere and everywhere and dump it in East St. Louis."

But East St. Louis officials disagree.

Mrs. Abbott, of the 3100 block of Louisiana Boulevard, spoke during a protest meeting Saturday of about 200 residents of East St. Louis, Alorton and Centreville. They met in the Alta Sita School, 2600 Bond Avenue in East St. Louis.

The meeting resulted in dozens of people taking petitions to circulate through the area.

One petition asks government officials to prevent the landfill and other hazardous waste sites from being opened in East St. Louis. Another petition objects to the state's plan for a work-release center for prisoners at 2900 Missouri Avenue.

Both projects are on the East St. Louis-Centreville boundary line.

East St. Louis Township Supervisor Clyde C. Jordan, who led Saturday's meeting, predicted 9,000 people would sign the petitions.

The landfill is an East St. Louis city project developed over the last four years. East St. Louis Mayor Carl E. Officer says it would solve the city's garbage disposal problem.

The landfill will save the city money, Officer said during the meeting. A privately operated landfill also will bring new money into the city, he said.

He said no hazardous wastes would be dumped there, only garbage.

The landfill petitions also oppose:

— A proposal by Wastex, 2000 Bond Avenue, East St. Louis, to build a hazardous liquid-waste incinerator.

— Continued storage of low-level nuclear waste at the Edlow International Warehouse, 3300 St. Clair Avenue.

— The use of a city lot at 580 North 20th Street as a garbage dump.

Citizens don't want a "prison" in the middle of the city, Jordan said. The work-release center would be for prisoners with only a few months left on their sentences. It is to be opened later this year by the Illinois Department of Corrections.

It will house between 175 and 200 prisoners, department officials said.

But no state corrections officials attended Saturday's meeting.

Alderwoman Frankie Seaberry of Centreville said the center's aim of finding jobs for convicts was unrealistic in the depressed area.

"We don't have jobs for people who aren't criminals," she said. "How will be find jobs for people who aren't criminals?"

She suggested the state move the center into a rural area where the prisoners would not endanger urban residents.

Elliott Lanson, vice president of LanChem Corp., a company adjacent to the site planned for the work-release center, said insurance companies were dropping their coverage of companies near 2900 Missouri Avenue. Businesses there will be considered too risky with a low-security prison nearby, Lanson said.

Companies that pay taxes would have to close because a state facility that pays no taxes would open, he said.

"We'll be putting 200 people out of work," Lanson said.

But Officer said he believed the center would benefit the city more than hurt it. He added that if he felt enough citizens opposed the center, he would reconsider his support for it.

Jordan said he and other citizens planned to take the petitions to state officials in Springfield on May 18.

Uranium Storage Safeguards Don't Pacify East St. Louisans

By Marjorie Mandel
Of the Post-Dispatch Staff

Security and storage arrangements have been improved at a uranium warehouse in East St. Louis that was damaged in a fire Dec. 7, the owner says.

But some residents say they are not reassured. They contend that the tons of radioactive material stored on the property pose a threat.

Jack Edlow, owner of Edlow International Co., said Thursday that all the radioactive material now was stored outside the warehouse at 3131 St. Clair Avenue. A security guard is on the premises 24 hours a day, he said.

"I've come in and done a thorough review of the site and determined that some things were inadequate — not bad, but inadequate," Edlow said. "I'm trying to respond to what I know is a concern on the part of the people in the area."

The Rev. Buck Jones, director of a civil rights group based in East St. Louis called Project Hope, said the warehouse should be closed despite the improvements.

"The danger is still there," he said. "We're not going to stop our activities and our resistance until Edlow is out of East St. Louis."

Jones also is chairman of the Save East St. Louis Coalition. That group has been formed to protest the warehouse's operations. About 250 people demonstrated in front of the warehouse in January. The group also has sent petitions to public officials and the Nuclear Regulatory Commission.

Jan Strasma, a spokesman at the NRC's regional office in Chicago, said the warehouse's license was amended after the fire to require Edlow to "reassess the suitability of the site and investigate possible alternative sites" before bringing any more enriched uranium hexafluoride onto the property. He said the matter was "still outstanding."

Edlow paid a $1,600 fine after the fire for violating NRC requirements. But he denied that the radioactive material had been dangerous.

Strasma said Edlow had complied with most of the NRC's requirements since the fire, including improving security and repairing a sprinkler system that had malfunctioned.

In the fire, part of the roof collapsed onto drums of yellowcake — uranium ore used to make fuel for nuclear power plants. Although government officials said no radioactivity had been released, the fire galvanized opposition to the warehouse.

The warehouse opened in 1980. It stores yellowcake and radioactive uranium hexafluoride. All the material now is stored outdoors on the 11-acre site. The yellowcake is stored in drums, which are placed in large aluminum containers. The uranium hexafluoride is stored in reinforced steel cylinders.

Edlow said the warehouse now was managed by a company employee. Before the fire, it had been managed by a private firm under contract.

ST. LOUIS POST-DISPATCH

Uranium In Metro East Still A Worry

By H.J. Jackson
Of the Post-Dispatch Staff

Some residents of East St. Louis remain worried about uranium stored in the Edlow International Co.'s warehouse in the city. Edlow stores low-grade uranium on the property, at 3131 St. Clair Avenue. The uranium is used for nuclear power plant fuel throughout the country.

Cecilia Hellman, co-principal at nearby St. Patrick Catholic Elementary School, 736 North 33rd Street, said numerous trucks had been in and out of the warehouse during the past several days. They appeared to be delivering more hazardous cargo, she said.

Residents were unaware of the warehouse's contents until last December, when a fire destroyed much of the building, she said. None of the contents burned or spilled during the fire.

The contents include about 3,000 drums of uranium ore called, "yellow cake" and about $20 million to $30 million in uranium fluoride, figures from the Illinois Department of Nuclear Safety show.

Since the fire, the warehouse has been the scene of numerous protests by residents.

Jack Edlow, owner of the warehouse, said trucks were shipping yellow cake to a utility company. He said no new stock was arriving. Instead, trucks were returning empty crates from a shipment made last week, he said.

He added that he was not prohibited from storing new supplies of yellow cake and uranium hexafluoride at the warehouse, under a license issued by the federal Nuclear Regulatory Commission.

The NRC has prohibited Edlow from receiving any more enriched uranium since the fire in December, said William Axelson, chief of the NRC Materials and Safeguards Branch. Enriched uranium is more potent than the other two varieties, Axelson said.

He added that yellow cake was harmless until it was refined. And as long as the uranium hexafluoride is in sealed drums, it is not dangerous either, he said. But if a drum ruptures, it could cause a reaction that would emit a gas harmful to people on the warehouse's grounds, he said.

The NRC forced Edlow to move the substances outdoors after the fire to prevent further dangers, Axelson said.

Opponents remain undeterred. The Rev. Buck Jones, director of Project HOPE, said he was planning more protests at the warehouse soon. He said he was planning to ask the East Side Health District to find that the warehouse was a health hazard and should be moved.

But Joseph Kurre, director of the Health District, said the Health District had no way to declare the warehouse a hazard.

The district, which gave the facility an operating license, has no expertise or equipment to inspect the warehouse, he said. The evidence needed to close the business would have to come from state and federal agencies, he said.

Thurs., Mar. 14, 1985 ST. LOUIS POST-DISPATCH

Evacuation Plan Lacking, Group Claims

By Safir Ahmed
Of the Post-Dispatch Staff

A spokesman for a Metro East group says no adequate emergency plans exist in East St. Louis and Sauget to deal with emergencies that might occur at industrial and chemical facilities in the area.

And a representative from a social workers group said the group had observed a higher incidence of cancer and respiratory problems in the Metro East area than elsewhere.

Representatives from the groups testified before the Chemical Safety Task Force at a hearing Wednesday at the Holiday Inn in Collinsville. The committee is reviewing emergency response capabilities at chemical plants as well as federal and state regulations designed to prevent industrial accidents.

The Rev. Buck Jones, founder and director of Project HOPE, a community service agency, testified that the alarm systems that had been installed in the Rush City area of East St. Louis were not enough to protect the residents. The systems were installed recently after incidents that involved gas leaks.

"It is our feeling that in a situation like Rush City, there must be adequate evacuation plans," Jones said. "No such plans exist. And telling people to close their doors and windows when the alarm sounds will not keep the vapors out. We are pleased that the alarms were installed, but we don't see them as a panacea."

The alarm systems were installed jointly by three companies that operate in Sauget — Monsanto Co., Amax Zinc Inc. and Ethyl Corp.

Warren Small, superintendent for environmental affairs at Monsanto, testified that the company had done everything it could to assure safety and prevent accidents.

"We're as safe as we know how," Small said. "And we're safer than we were last year. The W.G. Krummrich Plant in Sauget is 10 times safer than the industry average."

Two engineers from Monsanto also testified. They detailed the safety precautions taken by Monsanto in building and operating the plant in Sauget.

Jones also expressed concern over the presence of the warehouse in East St. Louis maintained by Edlow International Co. that stores uranium hexachloride, or "yellowcake."

"The mere presence of Edlow is a psychological problem for people in the area," Jones said. "And I believe the only reason it is located there is because East St. Louis is poor and

See PLAN, Page 2

From page one

black. We would recommend that someone, somehow, get the state to enact legislation that would prohibit hazardous materials from being stored in a populated area."

Pat Browder of the Social Workers for Health Priorities testified that area residents were experiencing high rates of respiratory problems and cancer.

"Madison and St. Clair counties are experiencing a notable number of hospital admissions with diagnoses of both cancer and respiratory distress," Ms. Browder said. "Many of us enjoy the (Mississippi) river, but the moisture rising from the river holds the pollutants down and increases our risk of absorption through the skin, lungs, stomach or colon. We have beautiful sunrises and sunsets, but this is a visual reminder of pollutants to us, and therefore not enjoyable."

Richard Carlson, co-chairman of the committee and director of the Illinois Environmental Protection Agency, said Wednesday's hearing was the last of three hearings. The committee will present a report to Gov. James R. Thompson by mid-April, Carlson said.

Uranium Warehouse Is Closing

By H. J. Jackson
Of the Post-Dispatch Staff

The Edlow International Co. plans to close its uranium storage warehouse at 3100 St. Clair Avenue in East St. Louis. The warehouse has been the target of numerous protests and demonstrations over the past two years because materials for nuclear powered generating plants are stored there.

Jan Strasma, of the Nuclear Regulatory Commission's office in Chicago, said Edlow had been granted a temporary license to store uranium ore there only until Aug. 31.

Robert Rich, executive vice president for Edlow International Co. in Washington, said the warehouse was closing because the company "didn't see a long-term profit potential."

Protestors call the closing a victory.

"Every now and then the little people win against the big people. The little people in this instance have a tremendous victory," said the Rev. Buck Jones, director of Project HOPE, a human service agency that has spearheaded the protests.

"It will be encouraging to other environmental groups who face the same situation," he said. "It's tremendous; I feel like I'm dreaming."

Strasma said the commission learned Tuesday of the company's decision. Government officials in the area will be notified this week, he said.

The company had applied for a renewal of the license for the warehouse. The previous license expired last February, and the company operated on a temporary extension.

The commission was waiting for answers to four pages of questions concerning the license application, Strasma said.

He said uranium hexafluoride, a mildly refined nuclear fuel, had been stored in the warehouse at one time, but no longer. The temporary license allows only yellow cake — uranium that has been processed into nuclear fuel — to be stored there, he said.

"The uranium hexafluoride could cause a problem if the canisters ruptured in a fire or something," Strasma said. "The yellow cake would not be a danger; it doesn't burn."

The warehouse caught fire in December 1983. Although no damage resulted from the chemicals, the incident triggered protests from church and civic groups throughout the area who learned that low-level radioactive materials were stored there.

1985-05-16-st-louis-post-dispatch-pg-9-a

As recently as Tuesday, Jones led demonstrations in front of the warehouse and urged letter-writing campaigns to officials. He worked to persuade the commission to refuse to renew the company's uranium storage license for the warehouse.

The protests had little to do with the decision to close, Rich said. But he added, "We've always been concerned with the feelings of our neighbors."

He said the property was leased "from an individual in St. Louis" but refused to identify the person.

The commission will supervise the company's move out of the warehouse, Rich said.

"The NRC will be doing an exhaustive examination of the property before we are released," he said.

Firm Closes Warehouse That Stored Uranium

By H.J. Jackson
Of the Post-Dispatch Staff

The Edlow International Co. warehouse near East St. Louis, where low-level uranium ore once was stored, has been permanently closed after two years of protests and demonstrations by its opponents.

A spokesman for the Nuclear Regulatory Commission said a recent inspection showed that the site, at 3131 St. Clair Avenue, was free of contamination.

Jack Edlow, owner of the operation, commented on the closing by saying, "What's to say? It's over."

A spokesman for the plant said the warehouse had been closed because the company "didn't see a long-term profit potential."

Opponents disagree; they say it was closed because residents had demanded that the company get out of town.

The warehouse stored low-level radioactive ore, called "yellowcake," and uranium hexaflouride. Both are used for fuel in nuclear power plants.

A spokesman for the federal commission said in the announcement, "The NRC performed an independent survey on Aug. 29, 1985, following removal of the remaining uranium from the site. The survey disclosed no evidence of any radioactive contamination at the site, and the property has been released by the NRC for unrestricted use."

The property was leased from an owner from St. Louis.

Opponents of the warehouse called the closing a victory. "It will be an inspiration for people to get involved in other struggles," said the Rev. Buck Jones, head of Project HOPE, a group that led many of the protests. "It will motivate us to take on some of the other corporate giants in the area.

Sister Cecilia Hellmann of St. Patrick's Parish in East St. Louis said, "I'm delighted to see Edlow leaving."

But Hellmann echoed Jones in saying she wanted to see the commission's final inspection report.

E. St. Louis Called Risky Spot Along Nuclear Waste Route

By H.J. Jackson
Of the Post-Dispatch Staff

Anti-nuclear activists in East St. Louis say moving spent fuel from the Three Mile Island nuclear reactor poses more of a risk to their city than to other areas along the 10-state path that the federal government plans to use.

"They switch from Conrail to Union Pacific here," said Sister Cecilia Hellmann. "Where is that going to be? Switching yards are where the accidents happen."

The spent fuel is being moved to Idaho from the Three Mile Island reactor near Harrisburg, Pa. It must cross the Mississippi River to St. Louis from the Metro East area. The bridge crossing poses another dangerous situation, Hellmann said.

Hellmann helped to lead protests against the Edlow International Co. warehouse in East St. Louis. The warehouse, where low-level nuclear fuel was stored for several years, closed last year.

The Rev. Buck Jones also led a protest to close Edlow. Jones said Project HOPE, which he directs, had classified the issue a top priority. HOPE stands for Helping Other People Emerge.

"We're going to mobilize the people to do whatever needs to be

1986-07-20-st-louis-post-dispatch

From page one

done," Jones said.

"It's crucial that we do something now.

"If we allow it to take place, and there is no protest from East St. Louis, perhaps the situation will continue. It presents more of a threat to East St. Louis than the other areas."

Jones said stopping the shipments would be more difficult than forcing Edlow to close. The time of the movement of the fuel is being kept secret in order to avoid sabotage or protests.

The federal government is transporting hundreds of tons of spent nuclear fuel rods from the core of the Three Mile Island reactor. An accident at the reactor in 1979 partly melted the core.

The government will move 35 to 40 separate rail shipments to a storage site about 50 miles from Idaho Falls, Idaho.

The first shipment will move through the metropolitan area this month; the entire process is expected to take more than two years.

The Illinois route runs basically parallel to Interstate 70. In the Metro East area, the route will include St. Clair, Madison and Bond counties.

Conrail will haul the specially made canisters to the Mississippi River. From there, the Union Pacific Railroad will haul the load across the river and west to Idaho.

Nationally, opponents of the plan say the waste should be housed at Three Mile Island and not hauled across the country. The canisters, built at a cost of $3.5 million, have yet to be tested adequately, opponents say.

Carl E. Officer, the mayor of East St. Louis, said also that the nuclear cargo would endanger residents of Illinois. Officer said he planned to ask governments along the route in Illinois to adopt a resolution urging the federal government to reconsider its route.

"We have to do this," Officer said. "The Nuclear Regulatory Commission is a front for the nuclear industry. The government is in the nuclear power business."

DOE Sells Radioactive Waste to West Germany

By Rudy Abramson
LOS ANGELES TIMES

WASHINGTON — The Department of Energy has quietly sold West Germany $20 million worth of highly radioactive cesium and strontium and is seeking to clear the way for its shipment from Hanford, Wash., to the Pacific Coast, then through the Panama Canal and across the Atlantic.

It would be the first large-scale export of high-level nuclear waste, and officials of the environmental activist organization Greenpeace said Thursday that they would attempt to block the shipments.

The West German government arranged in 1984 to buy the 9.5 tons of waste from nuclear weapons production for use in experiments and tests of permanent nuclear waste storage in abandoned salt domes.

The Energy Department's Hanford operation has processed the waste, which emits twice as much gamma radiation as waste from commercial power reactors, into 3-foot-long glass logs weighing 595 pounds each.

Under the arrangement between the two governments, the waste material will be loaded into 27,500-pound shipping casks and turned over to the Germans at Hanford for shipment by a private contractor.

Initial plans called for the first of three shipments to be made this fall, but officials with the Energy Department and the state governments of Oregon and Washington said arrangements are unlikely to be completed until at least next spring.

Tentatively, it was expected that the casks would be trucked from Hanford on Interstate 84 through the Columbia River gorge to the port of Portland.

But Dan Silver, special assistant to Washington Gov. Booth Gardner, said Washington state officials had been advised that the port of Seattle has not been ruled out as an alternative to Portland.

Officials in Oregon and Washington said they are willing to approve shipment through their states if they are convinced that all safety precautions have been taken.

Even so, "we have a long way to go," Silver said. "We are at the beginning of reviewing the documentation. We are very much in the preliminary stages. But there will be public hearings, and people will have to be satisfied that this is safe."

The Energy Department is expected to complete an environmental assessment report in November. And a department spokesman said the shipment may require a full environmental impact statement, which would provide for public hearings and comment on the proposal.

Although there are obvious safety concerns, Silver said, "our position is that we must transport nuclear waste in order to have a clean and safe environment, and, therefore, we need to establish procedures and the means to safely transport."

Germany bought the processed material to serve as heat sources to simulate the waste generated by its own nuclear power reactors.

Although the sales agreement with Germany was concluded five years ago, the Energy Department did not contact local officials about transporting the material from Hanford to Germany until recent weeks.

Initially, officials were told, there was consideration of barging the casks down the Columbia River. But Edlow International, the firm hired by the Germans to handle the shipping, favored surface transportation.

David Stewart-Smith of the Oregon Department of Transportation said the company is now leaning toward shipment by truck rather than rail because it believes it would retain stronger control over a trucking company than a railroad.

US to ship bomb-grade uranium to Romania

1989-12-11-the-guardian-pg-20

Alan George

THE US is planning to ship bomb-grade uranium to Romania despite fears that it may be working on a nuclear weapons programme.

The shipment of 16.48 kilograms of 93 per cent enriched uranium is destined for a 14-megawatt research reactor at Potesti, which was supplied by the California-based General Atomics company in the 1970s. The material, manufactured by General Atomics about 10 years ago, has been in storage with the Department of Energy (DOE).

The US provided 38.7 kilograms of enriched uranium for Potesti in 1978. This is now spent and the new consignment is needed to keep the reactor running. Romania's State Committee for Nuclear Energy approached the DOE and the US Nuclear Regulatory Commission (NRC) for the new supplies early last year. An export licence was issued in August last year, and this has now been extended until August 31, 1990.

Washington's nuclear collaboration with Romania dates from the 1970s, when the West was vigorously encouraging President Nicolae Ceausescu to pursue policies independent of the Soviet Union.

At the same time, Britain concluded a series of major contracts with Bucharest, including a deal for the supply of Rolls Royce engines for a locally-produced fighter aircraft.

Although Romania is a signatory to the Nuclear Non-Proliferation Treaty, Mr Ceausescu boasted earlier this year that his country had the capacity to produce nuclear weapons. Last summer, Romania reportedly warned neighbouring Hungary it was working on nuclear weapons and a ballistic missile system.

Engineers on Iraq's Condor-2 ballistic missile programme claim to have worked on a similar project in Romania.

Whatever Romania's military aspirations, Bucharest certainly has a record of carelessness with nuclear materials. In 1986, Norway supplied Romania with 12.5 tons of heavy water, on the strict understanding that it would not be re-sold. But Romania transferred the water either to Israel or India, prompting a formal protest from Oslo in May last year.

The US uranium shipment is being arranged by a Washington-based nuclear fuel management company, Edlow Inc. Its International Vice-President, Mr Rod Fisk, asked whether the company was concerned over how the uranium might be used, said: "That's a question you have to address to the US Government."

Waste transporter says it won't pay for extra security measures

WILMINGTON, N.C. (AP) — A waste transporter hired to haul nuclear fuel rods from a North Carolina port to South Carolina says it won't pay for security measures many times stiffer than required.

Edlow International Co. has said that if North Carolina or the U.S. Energy Department want stricter oversight, they should expect to pay the extra cost.

The Energy Department on Thursday was to announce its planned route for 343 fuel rods of enriched uranium from European reactors being shipped to the Sunny Point Military Ocean Terminal in Brunswick County.

The fuel rods would be unloaded at Sunny Point in Brunswick County and travel by train from Leland to Pembroke, the *Winston-Salem Journal* reported before the announcement. The route would take the fuel rods through Florence to Ashley Junction — near Charleston — then west to the Savannah River Nuclear Site for permanent storage.

The trip from Sunny Point to Savannah River will take 24 hours, according to Energy Department documents. Three shipments are expected in the next year.

The North Carolina Highway Patrol has demanded that the escort for the shipments include 12 state radiologists and a helicopter to survey the track ahead of the train for debris and protesters.

"The DOE has some 45-year history in transporting radioactive materials, and they have never had an accident that involved leakage," said Tom Hegele, spokesman for the Department of Crime Control and Public Safety, which oversees the Highway Patrol. "We don't want to be the first."

But Washington, D.C.-based Edlow International wrote the Energy Department saying the Highway Patrol asked for too much, the *Morning Star* of Wilmington reported.

"We cannot help but feel that this request is excessive and that the program is being used as a training exercise for which we are expected to pay," wrote Norman Ravenscroft, the company's vice president of operations.

Nuclear Regulatory Commission standards require only that the fuel rods be accompanied by two armed guards, said Jayne Brady, Energy Department spokeswoman.

Brady said her department is not opposed to the extra protection, but her department is not going to foot the bill. She said Edlow International only must pay for enough protection to meet NRC standards.

The state has made no similar demands for additional protection once the nuclear waste crosses the state line, Brady said.

Nuclear cask test doubted

NRC official says agency possesses limited data on Yucca site storage

BY ERIN NEFF
Scripps Howard News Service

LAS VEGAS – A Nuclear Regulatory Commission official said this week that his agency has limited information on the safety of nuclear waste casks, giving Nevada officials more ammunition in their fight against a nuclear waste repository.

According to a letter sent Tuesday to Sen. Harry Reid, D-Nev., NRC officials test scale models of casks and "cask impact limiters" – the materials used to protect the cask body during a collision.

The letter from Richard Meserve of the NRC in response to questions from Reid showed that the NRC has not conducted tests on full-scale cask models or physically test casks for damage by fire.

The NRC, which is responsible for regulating the nuclear industry, said those tests were performed by computer simulation.

"I'm shocked," said Reid, who is chairman of the Appropriations subcommittee that oversees the NRC. "The NRC is relying on small-scale tests of model

Nevada officials are fighting the proposed Yucca Mountain nuclear waste dump, which is 90 miles northwest of Las Vegas, by arguing that the transportation of nuclear waste is dangerous. Radioactive waste from the nuclear power plants in Two Creeks and Kewaunee would be sent to the facility.

The issue over testing waste transportation casks has come under fire by state leaders who question the testing of the casks. The NRC's computer tests support nuclear industry arguments that say transporting nuclear waste is safe.

But state leaders point to physical tests that show a cask could be vulnerable to a missile attack, and they say the casks could be penetrated or cracked in an accident or terrorists attack and release radioactive material.

State leaders say they hope the message resonates in Congress, which will vote on the Yucca project in the next few months.

"Who would buy a car that had only been crash tested on a computer screen or on a model

Nuclear industry officials stressed that full-scale model tests likely would only serve a public relations purpose, not a scientific one.

"It has been proven that computer modeling is sufficient," said Jack Edlow, president of Edlow International Co., a waste cask manufacturer.

NRC officials have said they already have a deep understanding of how casks would perform in an accident from tests dating to the late 1970s at Sandia National Laboratories, plus modern computer modeling.

NRC officials are planning more computer modeling and are considering a new round of physical tests, possibly full-scale tests, on waste containers in the next few years, NRC spokeswoman Rosetta Virgilio said.

GAINING STEAM

2003-06-22-the-daily-oklahoman-pg-1a

Nuclear energy plants are sources of low-cost electricity and potential targets for terrorists, experts say. Although no commercial plants are in Oklahoma, three stand just across state lines. And the industry is having a renaissance.

PHOTO PROVIDED BY ARKANSAS NUCLEAR ONE

Arkansas Nuclear One is a two-unit nuclear station in western Arkansas near Russellville, with a combined generating capacity of 1,694 megawatts. The plant supplies about 30 percent of the electricity used every year in Arkansas.

Nuclear reactors making a comeback

By Penny Owen
Staff Writer

Terrorists have surely scoped them out, those big double-dome nuclear reactors that interrupt rural skylines as they produce another day's electricity.

So have energy companies, only their views center not on the devastation of a full-scale attack, but on the potential of providing low-cost electricity to a demanding market.

FIRST IN A SERIES

▶ **MONDAY:** Bad memories of Sequoyah Fuels

In short, nuclear energy is making a comeback, despite all the terrorist concerns.

Don't expect to see a functioning nuclear plant in Oklahoma anytime soon, but the Sooner State is surrounded by reactors in three bordering states: Arkansas Nuclear One in Russellville, Ark.; Comanche Peak in Glen Rose, Texas; and Wolf Creek in Lebo, Kan.

The biggest effect on Oklahoma will likely be in the natural gas industry. The more nu-

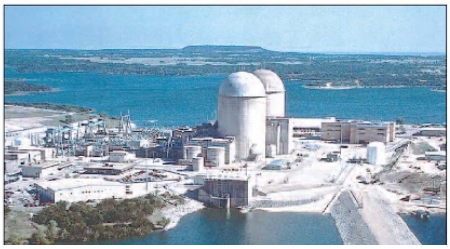
clear energy is produced, the less need for natural gas.

With natural gas prices now at an all-time high, the energy industry is scrambling to find cheaper sources for growing

"This was a very poor part of the world, and it (the plant) offered a helluva lot of opportunity," Lee said.

In fact, locals pitched in and helped build Comanche Peak, which helped them understand enough about it to feel safe. Today, the plant supplies 1,000 jobs.

Still, it took 15 years and, as Lee put it, "a ridiculous sum of money" to build. What should have cost $1 billion ended up costing $10 billion, due to evolving regulations and the inevita-



Oklahoma plans for nuclear waste to go through state

By Penny Owen
Staff Writer

Transporting nuclear waste on a large scale may be several years away, but routes are already being drawn up — and Oklahoma is definitely on the map for those long and potentially hazardous hauls.

If the Yucca Mountain nuclear dump site in Nevada is approved, spent fuel from the nation's nuclear plants would move across Interstate 40 from one end of the state to the other. It would move up Interstate 35 from the Texas state line to Oklahoma City; across a railway near Tulsa through Mayes and Cherokee counties, past Muskogee and through Sequoyah County.

Spent fuel shipments would pass through Oklahoma City along I-40. A railroad route that passes through Alva, Woodward

ing is slim, said Mitch Singer of the Nuclear Energy Institute. Shipping spent fuel is nothing new, he said, it's been done safely for decades.

Indeed, Oklahoma has had spent fuel shipments already. They just aren't advertised.

"I can't imagine that it hasn't crossed Oklahoma over the years," said Jack Edlow, president of Edlow International Co., which handles spent fuel and other hazardous shipments. "There are shipments certainly every month, maybe every week somewhere across the country."

Nationally, more than 3,000 shipments of spent fuel have crossed 1.7 million miles of highways and railroads since 1964. Altogether, fuel containers were involved in eight accidents, but none of them resulted in leaked radiation,

markets, and they're thinking nuclear.

Demand for electricity will increase nationwide by 1 to 2 percent each year, said Bill DeWare, vice president of energy marketing and trading at ONEOK, the parent company of Oklahoma Natural Gas.

In the last several years, a boom in building natural gas plants saturated Oklahoma's natural gas market. Some of those plants have yet to open — and they are costly to run.

"We're pretty much what we call flush in this area," DeWare said.

Oklahoma isn't only reliant on fossil fuels, however. Ground will soon be broken on a large wind power farm near Lawton, which recently was enlarged by the company building it, due to high natural gas prices.

Two other wind farms are also planned for the Sooner State.

Nuclear plants, meanwhile, are cheap to operate, though expensive to build. But the industry got a boost when the U.S. Senate approved $16 billion in loan guarantees to expand nuclear energy, which is enough to build about six nuclear plants.

"It's definitely getting a second wind," said Mitch Singer, spokesman for the Nuclear Energy Institute in Washington. "And it's because we have an overreliance on natural gas."

Singer said nuclear plants have proven themselves safe in recent years.

They hum along efficiently, most producing electricity around the clock. And they produce zero emissions, which keeps some environmentalists happy.

"Our public opinion polls show there's good support for nuclear energy around the country," said Singer, who said some nuclear plants even have nature preserves and wildlife sanctuaries on their property.

Yet enough has happened over the decades to frighten some people away from the potentially dangerous plants. Enter a second fear of having a terrorist target nearby, and all the safety records and security precautions around might not be a comfort.

As Jerry Lee, a spokesman for Comanche Peak nuclear plant in Glen Rose, Texas, put it, "You can sum up all the positives and come back to one negative: Are people afraid of it?"

Layers upon layers

In the tiny north Texas town of Glen Rose, selling a nuclear plant to the locals was "no challenge at all," Lee said. Not even in 1975, when anti-nuclear protests were swelling.

Glen Rose was proud of its dinosaur track exhibits and animal preserve – but that was about it. Jobs were scarce and folks were hurting.

But when TXU Energy rolled into town, it saw resources Glen Rose never knew it had. For one, the ground was stable, with the closest seismic fault way down in Austin.

Glen Rose had 3,300 acres of reservoir water – and nuclear plants need lots of water. The town was close enough to the booming Dallas-Fort Worth metroplex, which meant lots of customers nearby.

ble fits and starts. Nonetheless, Comanche Peak powered up in 1990 and has been going strong ever since.

Then Sept. 11, 2001, happened and nuclear plants nationwide were put on alert. Security measures got a scrubdown and hard questions were asked. What, for instance, would happen if a plane was flown into a reactor?

A simulated test showed that the containment center, which is the domed part of the reactor and the plant's most volatile spot, could withstand a hit from a Boeing 767-400 jet. The domes, with their 4-feet-6-inch concrete and steel beam walls and missile shields, were built to withstand earthquakes and other harsh elements and could therefore take the hit, according to the Nuclear Energy Institute.

However, the International Atomic Energy Agency questioned whether most nuclear plants could truly withstand a direct jumbo jet hit. Safest, perhaps, are those built near airports or military bases, where a plane crash was taken into consideration.

Getting onto a nuclear plant's property to wreak havoc is another story.

Comanche Peak follows industry standards, which include an FBI background check, psychological test and random drug testing for all employees.

After 9/11, a second entry checkpoint was installed a mile from the plant. All deliveries stop there for biological and chemical testing, among other things.

For everyone entering the plant, guards go through the routine identification checks, but much of the security is not seen. They go unnoticed even to someone who enters the plant daily. Reasons for cars being searched may not be apparent, nor are employees aware of why they might be singled out for closer observance.

Some security tightening is based on common sense, such as an increase in the force that entry gates can withstand.

Various entry points throughout the plant require hand print identification before going through floor-to-ceiling turnstiles. Armed guards check photo identification cards and perhaps make quick historical comparisons before allowing passage.

"You're being observed at all times by different cameras," Lee said. "It's layers of security stacked upon layers of security."

The 29-acre plant is surrounded by two razor-wire fences. Vital areas, like the cable spread room, require the "two-man rule," meaning no one is left alone. The radiological area will trap a stranger who makes a wrong move.

A 10-person crisis team does nothing but simulate crises. Also, 190 employees are on the team, in case a real crisis occurs. A detailed emergency plan exists for a 10-mile radius and a crisis room is equipped with direct links to the White House, the Texas governor and the military.

The likelihood of any nuclear accident affecting Oklahoma is extremely low, plant officials said.

The plant grounds are clean and quiet, yet sniper shields sit on top of buildings. A fake owl

An aerial view of the Comanche Peak nuclear power plant near Glen Rose, Texas. The plant is a major employer that was well-received by the community.

is perched on a pole to keep birds away.

The control room resembles a supersize cockpit, with dials and displays only a few understand. Every five weeks, control room operators leave for a week's training in an identical control room. The motto: Learn it and learn it again.

No buildings touch, so in case of an earthquake, damage will be kept to a minimum. In one area, a cacophony of steam pipes resembles an industrial-size pipe organ. Springs give them enough bounce to withstand a blow.

Protective clothing is to prevent contaminating the fuel – not the other way around, Lee said. Each employee has a chip that tracks any exposure to hazardous material. Everyone must pass through a contamination monitor coming and going. Oddly, some who have recently undergone certain medical treatments have set the monitors off, Lee said.

The controversial spent radioactive fuel is kept in ceramic containers below ground. Lee said there is enough room to store the plant's waste until 2017. Spent fuel takes little space, Lee said. Three years' worth could fit in a car trunk.

A museum-style visitor center at the entrance belies the tight security and potential hazards beyond the gates. Visitors learn in friendly push-button displays how nuclear energy works, why it is safe and so forth. Tours are commonplace, and a sign several miles away encourages them.

This careful balance of openness and secrecy is designed so Comanche Peak can be "good neighbors" to Hood County while protecting the plant. So far, Lee said, it works well.

Seeking permits

Even with every measure taken, nuclear energy production is not flawless. Enough advances have been made in recent years to make an accident like the one at Three Mile Island in Pennsylvania 23 years ago highly unlikely today.

Lee likened the Chernobyl nuclear disaster in Russia to "Wilbur Wright's airplane compared to the space shuttle." Technology and design, he said, have just made accidents like that impossible.

But problems do exist.

A south Texas nuclear plant and a South Carolina plant, for instance, were both recently found to have cracks in their reactors that if unchecked, could have expanded and led to overheating and a possible meltdown in the containment center. And a large hole was discovered in the 25-year-old Davis-Besse nuclear reactor in Ohio — one nobody thought could possibly occur.

Kerr-McGee's Cimarron plutonium plant near Crescent closed in the 1970s after one of its workers, Karen Silkwood, planned to meet a New York Times reporter to report the company for alleged fuel rod tampering. She died in a car accident on the way there.

A second nuclear plant never got built in Oklahoma. Work on the Black Fox plant near Inola was halted in 1982, largely due to anti-nuclear protests.

Today, 103 reactors operate at 64 nuclear plants nationwide. Many are more than 20 years old and are reaching their lifespans, which is another reason for the nuclear power renaissance. The last nuclear plant to be built was completed in 1996.

Now, three companies have applied for early site permits, which is the first step toward building. They are: Exelon, based in Chicago; Entergy in Louisiana; and Dominion in Virginia. Plans are to build alongside existing plants, rather than find new locations.

But don't expect any new reactors soon. It took 15 years to complete Comanche Peak, largely because of changing regulations. At one point, TXU Energy had to rebuild the entire plant to meet regulations, which took five years.

"In the next six years, a nuclear power plant isn't going to affect natural gas. It's just not a quick thing," said DeWare, who pointed out that selling a nuclear plant to a neighborhood has its own challenges.

"The nuclear industry didn't have a bad reputation until (Three Mile Island) happened," he said. "I think some of that's died down, but I think before a local government is going to be friendly to a local power plant, they're going to want assurances it's going to be safe."

passes through Alva, Woodward and Shattuck would also be used.

Never before have such large shipments been considered. But as spent fuel piles up, it has to go somewhere. Under serious consideration is an underground site at Nevada's Yucca Mountain as the central dumping site. That would mean spent fuel from 64 nuclear plants crisscrossing the country on the way to Nevada.

The Nuclear Energy Institute insists the hazards are low and all precautions will be taken. But some organizations, like the Environmental Working Group and Action Fund, believes the large-scale shipments will be disasters waiting to happen.

"I just find myself automatically in something of a worried posture when I hear an engineer say it's impossible, nothing will go wrong," said Ken Cook, a spokesman for the Environmental Working Group in Washington, which opposes mass shipments.

Cook also expressed concern about terrorism.

"If something were to go wrong you could have such serious consequences, you could have devastation for decades, it would be a complete mess," Cook said.

The likelihood of that happen-

according to the institute.

"It will be prepared and put into casks, it would be virtually impenetrable," Singer said. "They've been dropped from 30 feet on hard ground, they've had puncture testing, fire testing, and they've been banged up a little bit, but never penetrated."

Specialized trucking companies would be used and drivers would undergo extensive training.

Routes will be approved by the Nuclear Regulatory Commission after officials have driven them.

Law enforcement and emergency response teams along these routes will be trained to handle any accidents. And governors will be notified a week ahead of time before a shipment passes through.

Oklahoma Department of Environmental Quality spokeswoman Monty Elder said she hopes the federal government will provide its own emergency responders and take rigorous precautions en route.

"In the chance of an accident, those emergency responders would be in place and we would expect it to be the federal government's responsibility," Elder said.

The soonest these shipments would happen is 2010.

Highways and railroads used to ship nuclear materials

Proposed shipping routes if a nuclear repository is built Nevada.

A Sign of The Times for Your Cancer Care?

Congress and the Administration are currently considering changes in Medicare that could result in massive, nationwide disruptions in cancer treatment for critically ill patients.

Support H.R. 1622

1 in 2 men and 1 in 3 women are likely to hear the words, "You have cancer." and that risk increases with age. More than 60% of all cancer diagnoses are in the Medicare population.

As cancer survivors and caregivers, we've heard these dreaded words. But imagine hearing, "You have cancer," then discovering that your local cancer doctor's office is unable to treat you because cost-cutting measures proposed by Congress and the Administration have had unintended effects.

Everyone agrees that the Medicare reimbursement system for cancer chemotherapy is seriously flawed and needs reform. But reform and cost-savings cannot come at the expense of patients' access to quality care.

There is a responsible solution to this issue: H.R. 1622, The Quality Cancer Care Preservation Act, introduced by Representatives Charles Norwood and Lois Capps. The Norwood-Capps bill provides balanced reform of Medicare reimbursement policies that overpay for cancer chemotherapy drugs and underpay for chemotherapy services critical to people with cancer.

Call to Action!

We urge everyone to contact their Congressmen and ask them to support H.R. 1622, which is a more balanced approach to this issue and would preserve quality cancer care.

TRIBUNE INVESTIGATION

The search for a magic fuel

Argonne, Russia

Dawn of a second nuclear age?

and place orders.
At an international confer-

confront a scientific hurdle in their bid to replace bomb material in the world's reactors

Second of two parts

By Sam Roe
Tribune staff reporter

After 25 years, tens of millions of dollars and dozens of classified missions, America's quest to retrieve the world's most potent nuclear fuel had come down to this: a secret meeting in the heart of Moscow.

At one end of a conference room sat Russia's top nuclear scientists and bureaucrats. At the other were the Americans, led by Argonne National Laboratory's Armando Travelli, who had traveled to the Russian capital in the winter of 2003 to hear the results of a scientific test with grave implications for U.S. national security.

The unlikely research partnership of former Cold War rivals hoped to create a nuclear fuel that would persuade nations with highly enriched uranium to trade it in for something better and safer.

If the test was a success, Travelli might finally retrieve tons of the bomb-grade material that America and Russia had provided over decades. If the test failed, it would set back U.S. non-proliferation efforts for years.

The Russians told Travelli's team that there were some minor problems but nothing to worry about. They would do additional work and get back to the Americans.

"May I see the pictures of the test?" Travelli asked.

"I'm sorry," the head of the Russian team replied. "There are no pictures available."

The Russian, Travelli recalled, then abruptly stood up and walked out, followed by his colleagues.
